Production of Charm Mesons at B-factories

B factories produce charm mesons directly from *cc̄* hadronization or from decays of *B* mesons.

Inclusive Production: $e^+e^- \rightarrow c\bar{c} \rightarrow D_{(s)}^{**} X$ Exclusive Production: $e^+e^- \rightarrow b\bar{b} \rightarrow B\bar{B}, B \rightarrow D_{(s)}^{**} X$ where $D_{(s)}^{**}$ can be some excited charm meson.

$e^+e^- \rightarrow$	Cross-section (nb)		
$b\bar{b}$	1.05		
$c\overline{c}$	1.30		
$S\overline{S}$	0.35		
$u\overline{u}$	1.39		
$d\overline{d}$	0.35		
$\tau^+ \tau^-$	0.94		
$\mu^+\mu^-$	1.16		
e^+e^-	~ 40		

Charm Spectroscopy from B-factories

Predictions for the *D* and D_s states

- Predictions of the *D* and *D*_s mass eigenstates were performed since 1985 using QCD potential models.
- Recently (2001) the D_s spectrum predictions have been updated.
- The predicted masses of the excited states are generally in qualitative agreement with observations, however, for some states large quantitative differences exist.

Recent studies of these states will be presented in this talk.

Charm Spectroscopy from B-factories

The $D_{s0}^{*}(2317)$

The $D_{s0}^{*}(2317)$

- In an inclusive study of the D_sπ⁰ system BaBar discovered the narrow D_{s0}*(2317) state (2003) [*BaBar 91 fb-1* Phys. Rev. Lett. 90, 242001 (2003)].
- The low unexpected mass of this state triggered many subsequent studies by both BaBar and BELLE including the following:
 - □ $B \rightarrow D_{s0}^{*}(2317) D$ [BELLE ~110 fb⁻¹ Phys. Rev. Lett. 91, 262002 (2003)]
 - □ $D_{s0}^{*}(2317) \rightarrow D_{s}\pi^{0}$ inclusive [BELLE 87 fb⁻¹ Phys. Rev. Lett. 92, 012002 (2004)]
 - □ $B \rightarrow D_{s0}^{*}(2317) D^{(*)}$ [BaBar 113 fb⁻¹ Phys. Rev. Lett. 93, 181801 (2004)]
 - □ $B \rightarrow D_{s0}^{*}(2317) K$ [BELLE 140 fb⁻¹ Phys. Rev. Lett. 94, 061802 (2005)]

Charm Spectroscopy from B-factories

Precision $D_{s1}(2536)$ Parameters

Precision D_{s1}(2536) Parameters

- Preliminary BaBar analysis using 384 fb⁻¹ [presented at ICHEP 2010].
- Inclusive reconstruction of $D_{s1}(2536)^+ \rightarrow D^{*+}K_S$ where $D^{*+} \rightarrow D^0 \pi^+$ and $D^0 \rightarrow K^- \pi^+$ or $K^- \pi^+ \pi^- \pi^+$
- Parameters determined from the mass difference $\Delta m = m(D^*K_S) - m(D^*) - m(K_S)$ resolution is about 0.26 MeV.
- Preliminary results:

$$\begin{split} m(D_{s1}^+) &= (2535.10 \pm 0.01 \pm 0.18) \,\mathrm{MeV}/c^2 \\ \Gamma(D_{s1}^+) &= (0.92 \pm 0.03 \pm 0.04) \,\mathrm{MeV} \end{split}$$

• This is the first measurement of the $D_{s1}(2536)$ width.

Charm Spectroscopy from B-factories

Parameters of D_{sJ} Structures

- The mass values of the D_s*(2710) and D_s*(2860) are close to those of the first radial excitation of the D_s* and L=2 excited states, respectively.
- The mass of the D_s(3040) is close to that of the second radial excitation predicted in Ref. [T. Matsuki etal., Eur. Phys. J. A 31, 701 (2007)]
- The ratios of the D*K over DK branching fractions have been determined.
- For the D_s*(2710) the ratio is consistent with the value predicted for the first radial excitation. [P. Colangelo etal., Phys.Rev. D 77, 014012 (2008)]

$$m(D_{s1}^{*}(2710)^{+}) = 2710 \pm 2_{\text{stat}} (^{+12}_{-7})_{\text{syst}} \text{ MeV}/c^{2},$$

$$\Gamma = 149 \pm 7_{\text{stat}} (^{+39}_{-52})_{\text{syst}} \text{ MeV},$$

$$m(D_{sJ}^{*}(2860)^{+}) = 2862 \pm 2_{stat}(^{+5}_{-2})_{syst} \text{ MeV}/c^{2},$$

 $\Gamma = 48 \pm 3_{stat} \pm 6_{syst} \text{ MeV},$

$$m(D_{sJ}(3040)) = 3044 \pm 8_{\text{stat}} (^{+30}_{-5})_{\text{syst}} \text{ MeV}/c^2,$$

$$\Gamma = 239 \pm 35_{\text{stat}} (^{+46}_{-42})_{\text{syst}} \text{ MeV}.$$

$$\frac{\mathcal{B}(D_{s1}^*(2710)^+ \to D^*K)}{\mathcal{B}(D_{s1}^*(2710)^+ \to DK)} = 0.91 \pm 0.13_{\text{stat}} \pm 0.12_{\text{syst}},$$

$$\frac{\mathcal{B}(D_{sJ}^*(2860)^+ \to D^*K)}{\mathcal{B}(D_{sJ}^*(2860)^+ \to DK)} = 1.10 \pm 0.15_{\text{stat}} \pm 0.19_{\text{syst}}.$$

Charm Spectroscopy from B-factories

Angular Analysis of the D^{*}K System

- The helicity angle θ_h defined by the Kaon and pion provides information about the quantum numbers of the resonances.
- For both the D_s^{*}(2710) and D_s^{*}(2860), the angular distribution is consistent with natural parity.
- For the D_s(3040) the angular distribution is not conclusive.

Exclusive Studies of Broad D States

Exclusive Studies of Broad D States

■ Parameters of the $D_1(2430)$ determined from a Dalitz plot analysis of B⁺→D^{*-} $\pi^+\pi^+$:

> $M_{D'_1^0} = 2427 \pm 26 \pm 20 \pm 15 \text{ MeV}/c^2,$ $\Gamma_{D'_1^0} = 384^{+107}_{-75} \pm 24 \pm 70 \text{ MeV}.$

[BELLE 60 fb⁻¹ Phys. Rev. D 69, 112002 (2004)]

• The $D_0^*(2400)$ was confirmed by BaBar and its parameters determined from a Dalitz plot analysis of B⁺ \rightarrow D⁻ $\pi^+\pi^+$:

$$m_{D_0^{*0}} = (2297 \pm 8 \pm 5 \pm 19) \text{ MeV}/c^2$$

 $\Gamma_{D_0^{*0}} = (273 \pm 12 \pm 17 \pm 45) \text{ MeV},$

[BaBar 350 fb⁻¹ Phys. Rev. D 79, 112004 (2009)]

Charm Spectroscopy from B-factories

Inclusive Study of $D\pi$ and $D^*\pi$

Inclusive Study of $D\pi$ and $D^*\pi$

• Analysis of $D\pi$ and $D^*\pi$ systems produced from $c\overline{c}$ events:

$$e^+e^- \to c\bar{c} \to D^{**}X \to D^{(*)}\pi X$$

X represents any additional system.

- The following channels are reconstructed:

 - $D^{**+} \rightarrow D^0 \pi^+ \overset{L}{}_{K^-} \pi^+$

•
$$D^{**0} \to D^{*+}\pi^{-}$$

 ${}^{L}D^{0}\pi^{+}$
 ${}^{L}K^{-}\pi^{+} \text{ or } K^{-}\pi^{+}\pi^{-}\pi^{+}$

• The data set corresponds to about **10 times** more signal events than the previous study by the CDF collaboration.

 e^+

D, D*

π

The $D^+\pi^-$ System

- The mass distribution of the $D^+\pi^$ final state presents a prominent signal from the $D_2^*(2460)$ as well as two new structures at 2.60 GeV and 2.76 GeV.
- The peaking background at 2.30 GeV is due to D₂*(2460) and D₁(2420) decaying to D*π where the slow pion is missing.
- The broad D₀^{*}(2400) improves the fit quality, its parameters are floated within 2σ from the known values.
- The χ^2 /NDF of the fit is 281/242.

[BABAR (454 fb⁻¹) arXiv:1009.2076, submitted to PRD-RC (2010)]

Charm Spectroscopy from B-factories

The $D^0\pi^+$ System

- To confirm the new signals, the D⁰π⁺ system is analyzed.
- In this channel the feed-down backgrounds are stronger and the signal statistics of this are smaller so the widths of all signals are fixed to the widths measured in the D⁺π⁻.
- The mass values obtained are a few MeV higher than in D⁺π⁻, consistent with being the isospin partners.
- The fit quality is χ^2 /NDF=278/224.

[**BABAR** (454 fb⁻¹) *arXiv:1009.2076, submitted to PRD-RC (2010)*]

Charm Spectroscopy from B-factories

The $D^{*+}\pi^{-}$ System

- The D*π system shows prominent signals of D₁(2420) and D₂*(2460).
- In addition, there are new structures in the higher mass region. The region at 2.60 GeV is populated by two signals, while at 2.75 GeV there is a signal similar to the D*(2760) from D+π⁻.
- The parameters of the D₂*(2460) and D*(2600) are fixed to the ones from the D⁺π⁻.
- The fit quality is χ^2 /NDF=244/207.

[**BABAR (454 fb**⁻¹) *arXiv:1009.2076, submitted to PRD-RC (2010)*]

Charm Spectroscopy from B-factories

$D^{*+}\pi^{-}$ with $|\cos\theta_{\rm H}| > 0.75$

- The selection |cos(θ_H)|>0.75 is applied to suppress the resonances with natural spin-parity (dN/dcosθ_H ~ sin²θ_H).
- This fit allows to determine the parameters of the D(2550) under the assumption that the D^{*}(2600) is the same signal observed in D⁺ π^{-} .
- The parameters of the $D_2^*(2460)$ and $D^*(2600)$ are fixed to the values from $D^+\pi^-$.
- This fit also determines the parameters of the D₁(2420).
- The fit quality is χ^2 /NDF=214/205.

Charm Spectroscopy from B-factories

BaBar

Preliminary

$D^{*+}\pi^{-}$ with $|\cos\theta_{\rm H}| < 0.5$

- The selection $|\cos\theta_{H}| < 0.5$ is applied to favor the resonances with natural spin-parity.
- In this fit, the parameters of all signals, except the D(2750), are fixed to the values from the previous fits.
- This fit allows to observe clearly the D^{*}(2600) signal and shows consistency in the fit model.
- The fit quality is χ^2 /NDF=210/209.

Fit D

Resonance Parameters:

- The uncertainties on most parameters are dominated by systematic uncertainties.
- The systematic uncertainty includes the following sources: bin size and mass range of the histogram, errors on parameters fixed in the fits, Breit-Wigner shape of the new signals, a possible contribution from the D₁(2430), and background modeling.
- The significance of the new signals is estimated from the yield over its total uncertainty.

Angular Analysis of $D^{*+}\pi^-$

- The signal yields have been extracted as a function of $\cos\theta_{\rm H}$.
- The D₁(2420) shows a 1+Acos²θ_H distribution indicating unnatural spin-parity. The value for A indicates a significant S-wave contribution in the decay.
- The $D_2^*(2460)$ shows a $\sin^2\theta_H$ distribution consistent with the natural spin-parity assignment.

Charm Spectroscopy from B-factories

Angular Analysis of $D^{*+}\pi^-$

- For the signal D(2550) a cos²($\theta_{\rm H}$) distribution is obtained consistent with a J^P=0⁻ value.
- For the signal $D^*(2600)$ a sin²(θ_H) distribution is obtained consistent with natural spin-parity.
- For the signal D(2750) the interpretation of the distribution is not conclusive.

Charm Spectroscopy from B-factories

Interpretation of the $D\pi$ and $D^*\pi$ Results

- The $D^*(2600)$ signal observed in $D\pi$ and $D^*\pi$ has a mass value and helicity distribution consistent with the first radial excitation of the $D^*(2010)$.
- Likewise, the D(2550) observed in $D^*\pi$ has a mass value and helicity distribution consistent with the first radial excitation of the D^0 .
- The D(2750) observed in $D^*\pi$ has mass value lower than the $D^*(2760)$ observed in $D^+\pi^-$. The helicity distribution is not conclusive. These two signals may be due to the four L=2 excited states.

Charm Spectroscopy from B-factories

Conclusions

- The *B*-factories have large potential for advancing the understanding of the charmed hadron spectrum. In this talk, recent studies of the *D* and *D*_s mesons have been presented.
- The spectroscopy of charmed mesons has revived in recent years (2009-2010) with the observations by the BaBar of new structures in the *DK*, D^*K , $D\pi$, and $D^*\pi$ systems. These studies find candidates for the radial and L=2 excited states of the D_s and D mesons.
- Precision measurements of the narrow L=1 D_s mesons are possible from the large Data sets. A first measurement of the $D_{s1}(2536)$ decay width has been presented here.
- Charmed mesons obtained from *B* decays allow for the study of the broad L=1 states. However, updated studies of these decays are needed. In particular an analysis of $B^+ \rightarrow D^{*-}\pi^+\pi^+$ might provide much better parameter values for the $D_1(2430)$, and evidence for new the structures observed in the inclusive $D^{(*)}\pi$ analyses.
