## Compositeness of hadron resonances in chiral dynamics

The structure of hadron resonances attracts much attention, in conjunction with recent observations of various exotic hadrons which are not well described in the conventional picture. However, it is a subtle problem to define a proper classification scheme for hadron structure, and the finite decay width of hadron resonances makes the analysis complicated. In this talk, we summarize recent developments in the investigations of structure of resonances, focusing on the notion of the compositeness of particles.
