

τ Lepton Physics at Belle and BaBar

Simon Eidelman

Budker Institute of Nuclear Physics,
Novosibirsk, Russia

Outline

1. Lepton universality and τ lepton mass
2. Lepton universality and τ branching fractions
3. Hadronic decays
4. Conclusions

General

- τ lepton is one of the six fundamental leptons
- As the heaviest lepton, it may decay into both leptons and hadrons:
PDG lists more than 200 different τ decays
- We can study all interactions allowed in the Standard Model
and search for effects of New Physics
- It is a very clean laboratory with no hadrons
in the initial and only a few in the final state
- τ leptons will be an important tool at LHC

τ Lepton Factories

Group	$\int L dt, \text{fb}^{-1}$	$N_{\tau\tau}, 10^6$
LEP (Z-peak)	0.34	0.33
CLEO (10.6 GeV)	13.8	12.6
BaBar (10.6 GeV)	516	482
Belle (10.6 GeV)	782	719
τ -c (4.2 GeV)	10	32
SuperB	50k	45k

BaBar ($\sim 557 \text{fb}^{-1}$) and Belle ($\sim 946 \text{fb}^{-1}$) collected together about 1.5ab^{-1}

B-factory is also a τ factory producing $0.9 \cdot 10^6 \tau^+\tau^-$ pairs per each fb^{-1} !!

Super-c- τ -factory ($10^{35} \text{cm}^{-2} \text{s}^{-1}$) with $\int Ldt = 10 \text{ab}^{-1}$
will yield $32 \cdot 10^9 \tau^+\tau^-$ pairs!!

Lepton universality and M_τ

$$r = \left(\frac{G_{\tau \rightarrow e\nu_\tau\bar{\nu}_e}}{G_{\mu \rightarrow e\nu_\mu\bar{\nu}_e}} \right)^2 = \left(\frac{M_\mu}{M_\tau} \right)^5 \left(\frac{t_\mu}{t_\tau} \right) \mathcal{B}(\tau \rightarrow e\nu_\tau\bar{\nu}_e) \frac{F_{\text{cor}}(M_\mu, M_e)}{F_{\text{cor}}(M_\tau, M_e)}$$

r	t _τ , fs	B(τ → eν _τ ν̄ _e), %	M _τ , MeV	Comments
0.9405 ±0.0249	305.6 ± 6.0 ±0.0185	17.93 ± 0.26 ±0.0136	1784.1 ^{+2.7} _{-3.6} +0.0071 -0.0095	PDG, 1992 -2.4σ
0.9999 ±0.0069	291.0 ± 1.5 ±0.0052	17.83 ± 0.08 ±0.0045	1777.0 ^{+0.30} _{-0.27} ±0.0008	PDG, 1996 -0.01σ
1.0020 ±0.0051	290.6 ± 1.1 ±0.0038	17.84 ± 0.06 ±0.0034	1776.99 ^{+0.29} _{-0.26} ±0.0008	PDG, 2004 +0.4σ

$\sigma(e^+e^- \rightarrow \tau^+\tau^-)$ Near Threshold

Dotted – Born, dashed – Coulomb, FSR and VP,
dash-dotted – ISR, solid – beam energy spread

M_τ at KEDR: Observed $\sigma(e^+e^- \rightarrow \tau^+\tau^-)$

$\int Ldt = 6.7 \text{ pb}^{-1}, \quad 81 \text{ events selected}$

$$M_\tau = (1776.81_{-0.23}^{+0.25} \pm 0.15) \text{ MeV}/c^2$$

V.V. Anashin et al., JETP Lett. 85, 347 (2007)

M_τ at Belle and BaBar – I

Pseudomass method (ARGUS – 1992) uses

M_p – maximum inv. mass of observed hadrons

$$M_\tau^2 \geq M_p^2 = M_h^2 + 2(E_{\text{beam}} - E_h)(E_h - |\vec{p}_h|)$$

$$f(M_p) \sim (p_1 + p_2 M_p) \tan^{-1} (M_p - p_3) / p_4 + p_5 + p_6 M_p$$

The smearing of the endpoint and tail are caused by ISR/FSR and resolution

M_τ at Belle and BaBar – II

Both BaBar and Belle use $\tau^- \rightarrow \pi^- \pi^+ \pi^- \nu_\tau + \text{c.c.}$,
which has a large branching $\sim 9\%$
and large statistics in the endpoint region

M_τ at Belle and BaBar – II

Summary of Belle and BaBar measurements

Group	BaBar	Belle
$\int Ldt, \text{fb}^{-1}$	423	414
$N_{\tau\tau}, 10^6$	388	380
$N_{\text{ev}}, 10^5$	682	580
M_τ, MeV	$1776.68 \pm 0.12 \pm 0.41$	$1776.61 \pm 0.13 \pm 0.35$

BaBar: B. Aubert et al., arXiv:0909.3562

Belle: K. Belous et al., Phys. Rev. Lett. 99, 011801 (2007)

CPT Test by M_{τ^+} vs. M_{τ^-} – I

In the pseudomass method M_{τ^+} and M_{τ^-} are measured separately
and $\Delta M = M_{\tau^+} - M_{\tau^-}$ can be determined

Belle: $\Delta M = 0.05 \pm 0.23 \pm 0.14$ MeV

BaBar: $\Delta M = -0.61 \pm 0.23 \pm 0.06$ MeV

CPT Test by M_{τ^+} vs. M_{τ^-} – II

Group	OPAL, 2000	Belle, 2007	BaBar, 2009
$N_{\tau^+\tau^-}, 10^6$	0.16	380	388
$\Delta M, \text{MeV}$	0.0 ± 3.2	0.05 ± 0.27	-0.61 ± 0.24
$\Delta M/M_\tau, 10^{-4}$	0.0 ± 18.0	0.3 ± 1.5	-3.4 ± 1.4
$\Delta M/M_\tau, 10^{-4} \text{ } 90\%CL$	< 30.0	< 2.8	< 5.5

From MC studies BaBar finds, assuming no CPT violation, that there is a 1.2% chance of obtaining a result as different from zero as that of BaBar.

τ Lepton Mass Measurements

Group	M_τ , MeV
BES, 1996	$1776.96^{+0.18+0.25}_{-0.21-0.17}$
PDG, 2006	$1776.99^{+0.29}_{-0.26}$
KEDR, 2007	$1776.81^{+0.25}_{-0.23} \pm 0.15$
Belle, 2007	$1776.61 \pm 0.13 \pm 0.35$
PDG, 2008	1776.83 ± 0.18
KEDR, 2008	$1776.69^{+0.17}_{-0.19} \pm 0.15$
BaBar, 2008	$1776.68 \pm 0.12 \pm 0.41$

$r = 1.0039 \pm 0.0040$ (0.99σ) \Rightarrow Leptonic universality is OK!

The r sensitivity is six times higher than in 1992 (0.004 vs. 0.025)

This test (G_τ/G_μ) is limited by the accuracy of τ_τ and $\mathcal{B}(\tau^- \rightarrow e^- \bar{\nu}_e \nu_\tau)$

KEDR, 2008: A. Shamov, NPB (Proc. Suppl.) 189, 21 (2009)

Charged Current Universality – I

$$|G_\mu/G_e|$$

$\mathcal{B}(\tau \rightarrow \mu)/\mathcal{B}(\tau \rightarrow e)$	1.0000 ± 0.0020
$\mathcal{B}(\pi \rightarrow \mu)/\mathcal{B}(\pi \rightarrow e)$	1.0021 ± 0.0016
$\mathcal{B}(K \rightarrow \mu)/\mathcal{B}(K \rightarrow e)$	1.004 ± 0.007
$\mathcal{B}(K \rightarrow \pi\mu)/\mathcal{B}(K \rightarrow \pi e)$	1.002 ± 0.002
$\mathcal{B}(W \rightarrow \mu)/\mathcal{B}(W \rightarrow e)$	0.997 ± 0.010

A. Pich: NPB (Proc. Suppl.) 181-182, 300 (2008)

Charged Current Universality – II

$$|G_\tau/G_e|$$

$\mathcal{B}(\tau \rightarrow \mu)\tau_\mu/\tau_\tau$	1.0005 ± 0.0023
$\mathcal{B}(W \rightarrow \tau)/\mathcal{B}(W \rightarrow e)$	1.036 ± 0.014

$$|G_\tau/G_\mu|$$

$\mathcal{B}(\tau \rightarrow e)\tau_\mu/\tau_\tau$	1.0006 ± 0.0022
$\Gamma(\tau \rightarrow \pi)/\Gamma(\pi \rightarrow \mu)$	0.996 ± 0.005
$\Gamma(\tau \rightarrow K)/\Gamma(K \rightarrow \mu)$	0.979 ± 0.017
$\mathcal{B}(W \rightarrow \tau)/\mathcal{B}(W \rightarrow \mu)$	1.039 ± 0.013

Lepton Universality and Branching Fractions – I

Three recent measurements at BaBar (467 fb^{-1}):

Ratio	BaBar	PDG-08
$\mathcal{B}(\tau^- \rightarrow \mu^- \bar{\nu}_\mu \nu_\tau) / \mathcal{B}(\tau^- \rightarrow e^- \bar{\nu}_e \nu_\tau)$	$0.9796 \pm 0.0016 \pm 0.0035$	0.9725 ± 0.0039
$\mathcal{B}(\tau^- \rightarrow \pi^- \nu_\tau) / \mathcal{B}(\tau^- \rightarrow e^- \bar{\nu}_e \nu_\tau)$	$0.5945 \pm 0.0014 \pm 0.0061$	0.6076 ± 0.0061
$\mathcal{B}(\tau^- \rightarrow K^- \nu_\tau) / \mathcal{B}(\tau^- \rightarrow e^- \bar{\nu}_e \nu_\tau)$	$0.03882 \pm 0.00032 \pm 0.00056$	0.0384 ± 0.0013

Mode	$e^- \bar{\nu}_e \nu_\tau$	$\mu^- \bar{\nu}_\mu \nu_\tau$	$\pi^- \nu_\tau$	$K^- \nu_\tau$
$N_{\text{ev}}, 10^3$	884	731	369	25

$$\left(\frac{G_\mu}{G_e} \right)^2 = \frac{\mathcal{B}(\tau^- \rightarrow \mu^- \bar{\nu}_\mu \nu_\tau) f(m_e^2/m_\tau^2)}{\mathcal{B}(\tau^- \rightarrow e^- \bar{\nu}_e \nu_\tau) f(m_\mu^2/m_\tau^2)},$$

where $f(x) = 1 - 8x + 8x^3 - x^4 - 12x^2 \log x$, $m_\nu = 0$.

$|G_\mu/G_e| = 1.0036 \pm 0.0029$, consistent with 1.000 ± 0.002 (A. Pich, 2008).

B. Aubert et al., arXiv:0808.1121

Lepton Universality and Branching Fractions – II

$$\left(\frac{G_\tau}{G_\mu}\right)^2 = \frac{\mathcal{B}(\tau^- \rightarrow \pi^- \nu_\tau)}{\mathcal{B}(\pi^- \rightarrow \mu^- \bar{\nu}_\mu)} \frac{2m_\pi m_\mu^2 \tau_\pi}{\delta_{\tau^- \rightarrow \pi^- \nu} / \pi^- \rightarrow \mu^- \bar{\nu} m_\tau^3 \tau_\tau} \left(\frac{1 - m_\mu^2/m_\pi^2}{1 - m_\pi^2/m_\tau^2}\right)^2,$$

$$\left(\frac{G_\tau}{G_\mu}\right)^2 = \frac{\mathcal{B}(\tau^- \rightarrow K^- \nu_\tau)}{\mathcal{B}(K^- \rightarrow \mu^- \bar{\nu}_\mu)} \frac{2m_k m_\mu^2 \tau_K}{\delta_{\tau^- \rightarrow K^- \nu} / K^- \rightarrow \mu^- \bar{\nu} m_\tau^3 \tau_\tau} \left(\frac{1 - m_\mu^2/m_K^2}{1 - m_K^2/m_\tau^2}\right)^2,$$

where the radiative corrections are

$$\delta_{\tau^- \rightarrow \pi^- \nu} / \pi^- \rightarrow \mu^- \bar{\nu} = 1.0016 \pm 0.0014 \text{ and } \delta_{\tau^- \rightarrow K^- \nu} / K^- \rightarrow \mu^- \bar{\nu} = 1.0090 \pm 0.0022.$$

$$|G_\tau/G_\mu| = 0.9859 \pm 0.0057 (0.9836 \pm 0.0087) \text{ with pions (kaons)}$$

compared to $0.996 \pm 0.005 (0.979 \pm 0.017)$.

Lepton Universality and Branching Fractions – III

From PDG $\mathcal{B}(\tau^- \rightarrow e^- \bar{\nu}_e \nu_\tau) = (17.82 \pm 0.05)\%$ and previous $\mathcal{B}(\tau^- \rightarrow \mu^- \bar{\nu}_\mu \nu_\tau)$
the new WA $\mathcal{B}(\tau^- \rightarrow \mu^- \bar{\nu}_\mu \nu_\tau) = (17.363 \pm 0.043)\%$.

From this and assuming $\mu - e$ universality as well as from
 τ_τ/τ_μ and assuming $\tau - \mu$ universality, one obtains

$$\mathcal{B}(\tau^- \rightarrow e^- \bar{\nu}_e \nu_\tau)^{\text{univ}} = (17.833 \pm 0.030)\%.$$

The total hadronic branching

$$\mathcal{B}_{\text{had}} = 1 - 1.97257 \cdot \mathcal{B}(\tau^- \rightarrow e^- \bar{\nu}_e \nu_\tau)^{\text{univ}} = (64.823 \pm 0.059)\%$$

and the total hadronic width $R_{\tau,\text{had}} = 3.6350 \pm 0.0094$.

Decays with η Mesons at Belle

Mode	Group	N_{ev}	\mathcal{B}_{exp}
$\pi^- \pi^0 \eta \nu_\tau$	Belle, 2008	5675 ± 111	$(1.35 \pm 0.03 \pm 0.08) \cdot 10^{-3}$
	CLEO, 1992	125 ± 16	$(1.7 \pm 0.2 \pm 0.2) \cdot 10^{-3}$
$K^- \eta \nu_\tau$	Belle, 2008	1545 ± 51	$(1.58 \pm 0.05 \pm 0.09) \cdot 10^{-4}$
	CLEO, 1996	61 ± 14	$(2.6 \pm 0.5 \pm 0.4) \cdot 10^{-4}$
$K^- \pi^0 \eta \nu_\tau$	Belle, 2008	241 ± 34	$(4.6 \pm 1.1 \pm 0.4) \cdot 10^{-5}$
	CLEO, 1999	47 ± 12	$(17.7 \pm 5.6 \pm 7.1) \cdot 10^{-5}$
$K^{*-} \eta \nu_\tau$	Belle, 2008	119 ± 19	$(1.30 \pm 0.13 \pm 0.11) \cdot 10^{-4}$
	CLEO, 1999	27 ± 6	$(2.90 \pm 0.80 \pm 0.42) \cdot 10^{-4}$
$K_S \pi^- \eta \nu_\tau$	Belle, 2008	45 ± 8	$(4.4 \pm 0.7 \pm 0.2) \cdot 10^{-4}$
	CLEO, 1999	15	$(1.00 \pm 0.35 \pm 0.11) \cdot 10^{-3}$

Important for estimating BG in searches for second-class currents!

Belle (490 fb^{-1}): K. Inami et al., Phys. Lett. B 672, 209 (2009)

τ^- Decays with Kaons

1. Decays with 1 or 3 kaons are Cabibbo-suppressed, $A \propto \sin \theta_c$
 - $\mathcal{B}(\tau^- \rightarrow S = -1) = (2.87 \pm 0.12)\%$, ALEPH, 1999;
(2.81 \pm 0.19)%, OPAL, 1999
 - From strange spectral functions m_s , $|V_{us}|$
 - Hadronic physics, K^*
2. Decays with 2 kaons, $A \propto \cos \theta_c$
 - $\mathcal{B}(\tau^- \rightarrow (K\bar{K}X)^- \nu_\tau) \sim 0.7\%$
 - Vector or Axial-vector? Wess-Zumino anomaly
 - CVC tests in τ vs. e^+e^-
 - Hadronic physics, $K^*\bar{K}n\pi$, $V(\rho, \phi)n\pi$

$$\tau^- \rightarrow (K\pi)^- \nu_\tau \text{ at Belle and BaBar – I}$$

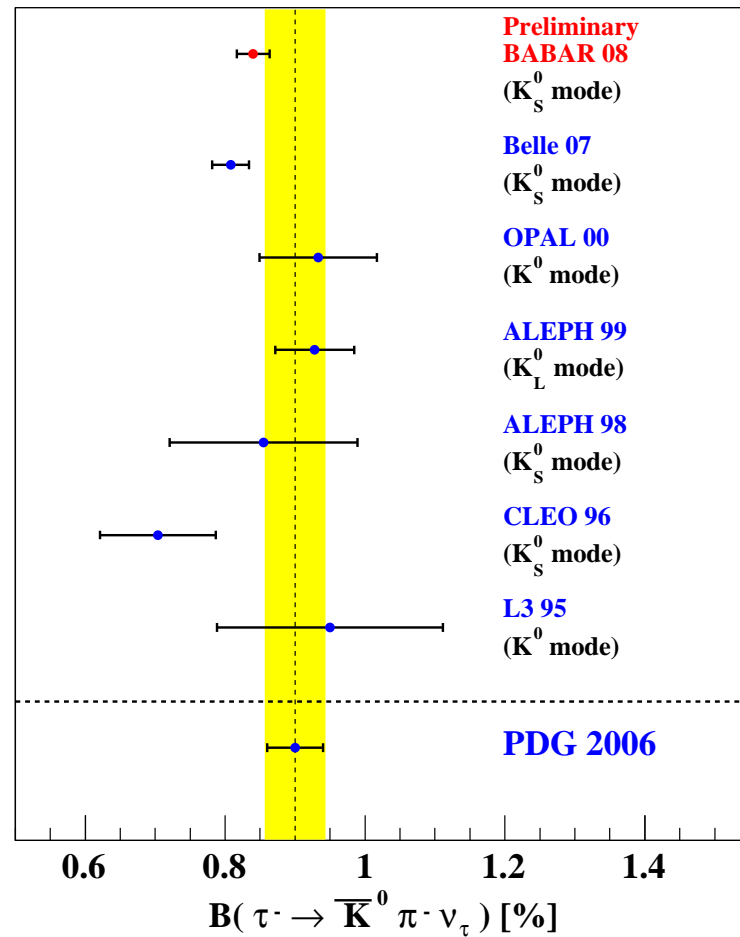

Summary of Belle and BaBar $\tau^- \rightarrow (K\pi)^- \nu_\tau$ measurements

Mode	Group	$\int Ldt, \text{fb}^{-1}$	$N_{\tau\tau}, 10^6$	$N_{\text{ev}}, 10^3$	$\mathcal{B}, \%$
$K^- \pi^0 \nu_\tau$	BaBar [1]	230	212	78.1	$0.416 \pm 0.003 \pm 0.018$
$K_S^0 \pi^- \nu_\tau$	BaBar [2]	385	353	83.7	$0.420 \pm 0.002 \pm 0.012$
$K_S^0 \pi^- \nu_\tau$	Belle [3]	351	313	53.1	$0.404 \pm 0.002 \pm 0.013$

BaBar [1]: B. Aubert et al., Phys. Rev. D 76, 051104 (2007)

BaBar [2]: B. Aubert et al., arXiv:0808.1121

Belle [3]: D. Epifanov et al., Phys. Lett. B 654, 65 (2007)

$$\tau^- \rightarrow (K\pi)^- \nu_\tau \text{ at Belle and BaBar – II}$$

$$\mathcal{B}^{\text{BaBar}}(K^- \pi^0 \nu_\tau) = (0.416 \pm 0.003 \pm 0.018)\%$$

$$\mathcal{B}^{\text{PDG}}(K^- \pi^0 \nu_\tau) = (0.454 \pm 0.030)\%$$

For both modes new \mathcal{B} are consistent with PDG, but lower!

$M(K\pi)^-$ from BaBar

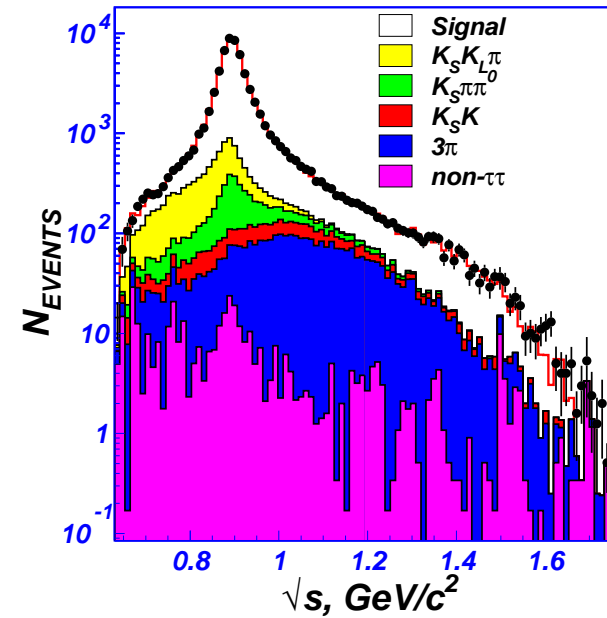

$\tau^- \rightarrow K^- \pi^0 \nu_\tau$: B. Aubert et al., Phys. Rev. D76, 051104 (2007)

$\tau^- \rightarrow K_S^0 \pi^- \nu_\tau$: B. Aubert et al., arXiv:0808.1121

Analysis of $M(K\pi)$ spectra is in progress

$K_S\pi$ Mass Spectrum at Belle

The $M_{K\pi}$ spectrum is well described by
the $K^*(892)$, $K^*(800)$ (κ) and $K_0^*(1430)$ (or $K^*(1410)$).

$K^*(892)^0$ Mass and Width Measurement at Belle

$$M(K^*(892)^-) = (895.47 \pm 0.20 \pm 0.44 \pm 0.59) \text{ MeV}$$

$$\Gamma(K^*(892)^-) = (46.2 \pm 0.6 \pm 1.0 \pm 0.7) \text{ MeV}$$

$\tau^- \rightarrow h^- h^+ h^- \nu_\tau$ from BaBar and Belle

Mode	BaBar, 342 fb ⁻¹	Belle, 666 fb ⁻¹	PDG2006
$N_{\text{ev}}, 10^6$	1.6	8.86	–
$\mathcal{B}(\pi^- \pi^+ \pi^-), 10^{-2}$	$8.83 \pm 0.01 \pm 0.13$	$8.42 \pm 0.01 \pm 0.26$	9.02 ± 0.08
$N_{\text{ev}}, 10^4$	7.0	79.4	–
$\mathcal{B}(K^- \pi^+ \pi^-), 10^{-3}$	$2.73 \pm 0.02 \pm 0.09$	$3.28 \pm 0.01 \pm 0.17$	3.33 ± 0.35
$N_{\text{ev}}, 10^4$	1.8	10.8	–
$\mathcal{B}(K^- K^+ \pi^-), 10^{-3}$	$1.346 \pm 0.010 \pm 0.036$	$1.53 \pm 0.01 \pm 0.05$	1.53 ± 0.10
N_{ev}	275	3160	–
$\mathcal{B}(K^- K^+ K^-), 10^{-5}$	$1.58 \pm 0.13 \pm 0.12$	$2.62 \pm 0.15 \pm 0.17$	$< 3.7 \cdot 10^{-5}$

BaBar: B. Aubert et al., Phys. Rev. Lett. 100, 011801 (2008)

Belle: M.J. Lee et al., arXiv:0812.0480

Results of Belle and BaBar are not very consistent

Strange spectral function

$$\text{ALEPH: } |V_{us}| = 0.2204 \pm 0.0028_{\text{exp}} \pm 0.0003_{\text{th}} \pm 0.0001_{m_s}$$

$$\text{J.Prades from OPAL data: } |V_{us}| = 0.2219 \pm 0.0034, \quad m_s = (81 \pm 20) \text{ MeV}$$

$$m_s - \text{J.G.Körner, A.Pivovarov, 2001-2005, } m_s = (130 \pm 27) \text{ MeV}$$

$|V_{us}|$ determination from $\mathcal{B}(\tau^- \rightarrow K^- \nu_\tau) / \mathcal{B}(\tau^- \rightarrow \pi^- \nu_\tau)$

$$\begin{aligned} \frac{\mathcal{B}(\tau^- \rightarrow K^- \nu_\tau)}{\mathcal{B}(\tau^- \rightarrow \pi^- \nu_\tau)} &= \frac{f_K^2 |V_{us}|^2 \left(1 - \frac{m_K^2}{m_\tau^2}\right)^2}{f_\pi^2 |V_{ud}|^2 \left(1 - \frac{m_\pi^2}{m_\tau^2}\right)^2} \times \frac{\delta_{\tau^- \rightarrow K^- \nu_\tau}}{\delta_{\tau^- \rightarrow \pi^- \nu_{tau}}} \\ &= 0.06531 \pm 0.00056 \pm 0.00093, \end{aligned}$$

All non-perturbative effects are in $f_K/f_\pi = 1.189 \pm 0.007$ from the lattice.

One obtains $|V_{us}| = 0.2254 \pm 0.0023$
consistent with 0.2262 ± 0.0011 from unitarity.

Another method, which uses $R_{\tau, \text{strange}}$ based on PDG plus BaBar/Belle \mathcal{B} 's,
gives $|V_{us}| = 0.2169 \pm 0.0029$ or $\sim 3\sigma$ lower than the unitarity value.

Might be due to theory problems.

Monte Carlo Simulation of τ Decays

TAUOLA, KORALB(Z) – very important tools for LEP, CLEO, BaBar, Belle, LHC

S.Jadach, Z.Wąs, Comp. Phys. Commun. 36, 191 (1985);

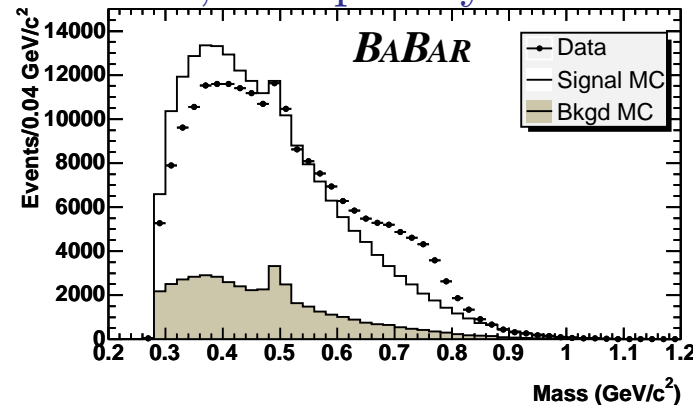

S.Jadach, J.H.Kühn, Z.Wąs, Comp. Phys. Commun. 64, 275 (1990);

High-statistics experiments \Rightarrow more precise description

Novosibirsk e^+e^- data for hadronic currents in $\tau \rightarrow 4\pi\nu_\tau$

A.Bondar, SE, ..., Z.Wąs, M.Worek, Comp. Phys. Commun. 146, 139 (2002)

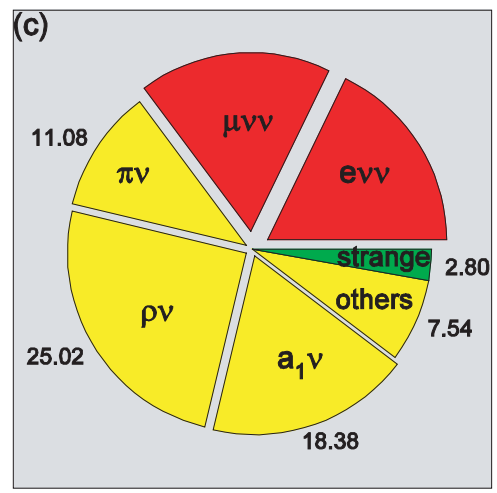

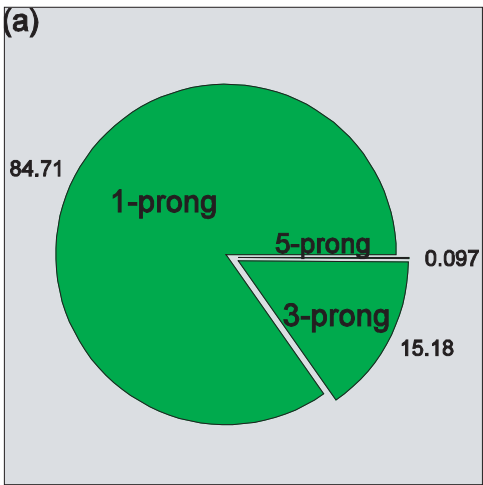

Improvement in J.H.Kühn, Z.Wąs, Acta Phys. Polon. B39, 147 (2008).

Conclusions

- We know a lot after CLEO and LEP, Belle and Babar gaining speed
- Advantages in statistics and searches. Systematic effects?
- Lepton universality holds, more precise τ_τ and \mathcal{B}_e needed
- Interesting possibilities for QCD, $|V_{us}|$
- Why most $\mathcal{B}_{\text{new}} < \mathcal{B}_{\text{old}}$?
- Clean laboratory for studies of light mesons, e.g., of various K^* 's
- Hadronic f/f in TAUOLA should be updated
- B factories with $\sim 1.5 \text{ ab}^{-1}$ are also unique τ factories with high potential for New Physics and precision studies in SM, even more expected from SuperB and Super-c – τ

Total	0.41	0.35

Both groups assume $M_{\nu_\tau}=0$

Belle: 10 MeV $\Rightarrow \Delta M_\tau = -0.1$ MeV

BaBar: 1 MeV $\Rightarrow \Delta M_\tau = -0.02$ MeV

Charge asymmetry from ΔM in D^\pm , D_s^\pm , Λ_c^\pm : Belle - 0.14 MeV, BaBar - 0.06 MeV

$|V_{us}|$ from BaBar and Belle

S. Banerjee at KAON 07 combined the recent data on the $K\pi\nu_\tau$ with older data for the other modes
