## Observation of $\chi_{C J} \rightarrow K_{S}^{0} K_{S}^{0} K_{S}^{0} K_{S}^{0}$

San－Qiang Qu Ming－gang Zhao Hai－long Ma Nankai University Institute of High Energy Physics 2017．04．25

## © Oütline

## Motivation

## Data sample

## Event selection

## Branching fraction

Summary

Theoretical work indicates that the color octet mechanism could have large contributions to the decays of the P-wave charmonium states.

However, Many theoretical calculations and experimental measurements still have large errors. more precise experimental data besides more theoretical efforts are mandatory to further understand $\chi_{C J}$ decay dynamics.

Thus, the measurement of as many exclusive hadronic $\chi_{C J}$ decay as possible is valuable.

First observations of $\chi_{C J} \rightarrow K_{S}^{0} K_{S}^{0} K_{S}^{0} K_{S}^{0}$

## Data Sample

## 1. DATA : $447.9 \mathrm{M} \Psi(3686)(106.8 M(2009)+341.1 M(2012))$

2. Inclusive MC : 506M $\Psi(3686)(106 M(2009)+400 M(2012))$
$\psi(3686) \rightarrow$ anything
3. Exclusive MC : (P2GC0/P2GC1/P2GC2 PHSP) 100 K for $\mathrm{J}=0,1,2 \psi(3686) \rightarrow \gamma \chi_{C J} \rightarrow \gamma K_{S}^{0} K_{S}^{0} K_{S}^{0} K_{S}^{0}$
1000 K for $\psi(3686) \rightarrow \bar{K}^{*} K_{S} f_{0}(1710)$
1000 K for $\psi(3686) \rightarrow \bar{K}^{*} K_{S} f_{2}^{\prime}$

Boss Version: 6.6.4

Charged track selection :

1. $|\cos \theta|<0.93$
2. Momentum cut : $P<2.0 \mathrm{Gev}$
3. Charge cut : $|Q|=1 ; \operatorname{Sum}(Q)=0$
4. $n$ Good $=8$
$K_{S}^{0}$ reconstruction :
5. Second vertex fit applied
6. DecayLength/DecayLengthError > 2
7. $\left|M_{\pi \pi}-0.4976\right|<0.012 \mathrm{GeV}$
8. $n K_{s}^{0}=4$

## Event selection

## Good photon :

1. The timing information of the EMC should be within $0 \leqslant t \leqslant 14$ (in the unit of 50 ns ).
2. The deposited energy should be larger than 25 MeV in the endcap |cos $\theta \mid<0.8$ and larger than 50 MeV in the barrel ( $0.86<|\cos \theta|<0.92$ );
3. The angle between the photon and the nearest charged track must be larger than 20 to distinguish the shower from charged particles

## KinematicFit

If more than one combination survived in one event, the one with the smallest $\chi^{2}$ is retained.

## $K_{S}^{0}$ reconstruction

## Systematic uncertainty

1. Reconstruction of $K_{S}^{0}$

We use the same $K_{S}^{0}$ selection criteria as used in PRD92-072012. The data-MC different of $K_{S}^{0}$ reconstruction is studied in PRD92-072012 and shown below. The fit give the fitted data-MC difference to be $(1.01 \pm 0.53) \%$. So we assign $1.5 \%$ as systematic uncertainty per $K_{S}^{0}$.

the uncertainty includes differences between data and MC in tracking efficiency, decay length cut, mass spectra cut, vertex and second vertex fitting.

## Systematic uncertainty

## Update

2. MC model

The uncertainty in MC model is assigned by comparing the MC efficiencies with the ones involving possible sub-resonances.

| Channel | $\chi_{C 0}[\%]$ | $\chi_{C 0}[\%]$ | $\chi_{C 0}[\%]$ |
| :---: | :---: | :---: | :---: |
