

Trial of the fitting between data & model

Try to fit the model with a CEPC data

$\mu\mu$ HZZ channel (@ pre-selection)

Sorry of this coloring.

Blue is the CPEC data

Red is a model with SM

Since the error is big (due to its statistics), the obtained χ^2 is really small. Error is calculated from root square, and poisson may be better. Now just trying to fit the other angles and then make a χ^2 plot (in 2D ?)

The others

- Latex (for memo)
 - have tried a bit. I am not quite sure about Livetex... but
 - at lxslc6, if I comment out “fynmp” at the beginning, it was fine.
 - at my local (Debian9), the compilation was fine if a logo picture is converted to pdf file. (This error did not happen in lxslc6, therefore, it really depends on libraries)
