Muon charge misID rate study

According to ATL-COM-PHYS-2013-810, QmisID rates are below $10e-5$ due to

- ID Inner Detector
- MS Muon Spectrometer

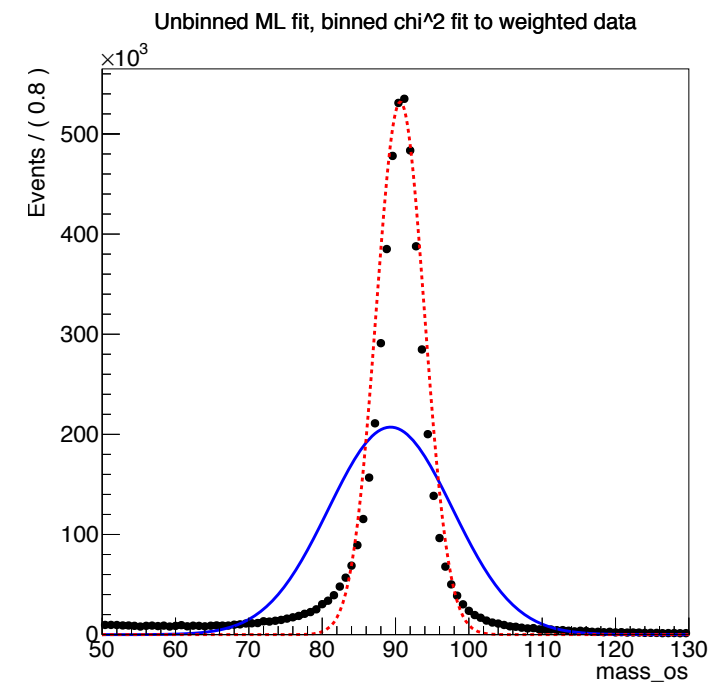

Run with Z->dimuon samples, select Loose muon

Type:
Entries:

SS
403

OS
 1.4×10^7

Looking at V2 samples

Three channels: ee, uu, eu.

- pre-selection
- Same sign lepton
 - Loose lepton(different definition for e and muon)
 - B jet veto
 - Njet \geq 0
 - passEvenCleaning

```
Selection: "(abs(lep_ID_0)==13&&lep_isLoose_0)&&(abs(lep_ID_1)==13&&lep_isLoose_1)&&passEventCleaning&&(lep_ID_0*lep_ID_1>0)&&lep_isolationFixedCutLoose_0&&lep_isolationFixedCutLoose_1&&nJets_OR_T>=2&&nJets_OR_T_MV2c10_70==0" //e_muon channel
```

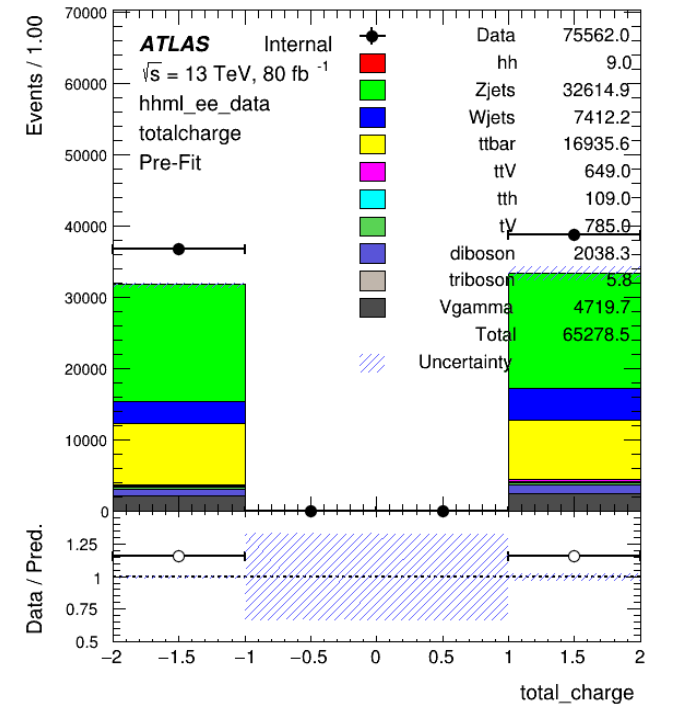

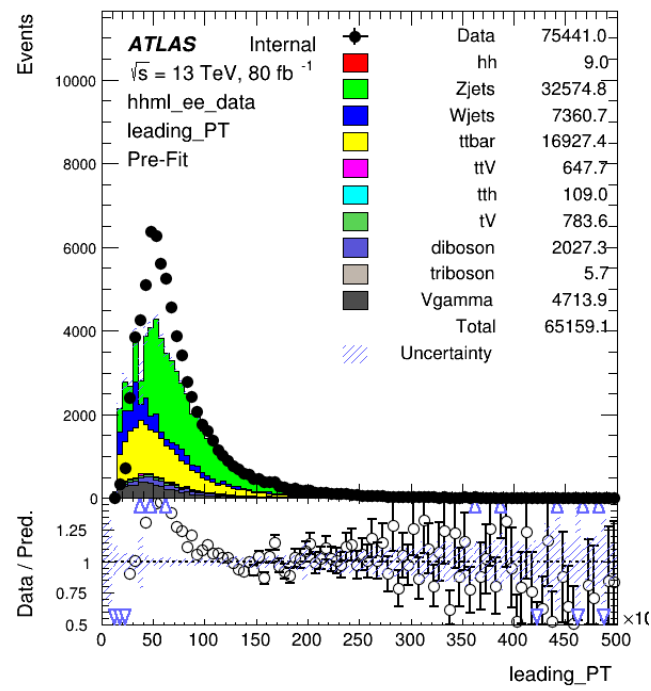

Undo

- Lepton Triggers: not available
- Lepton pt
- MET
- Zwindow in ee
- MII

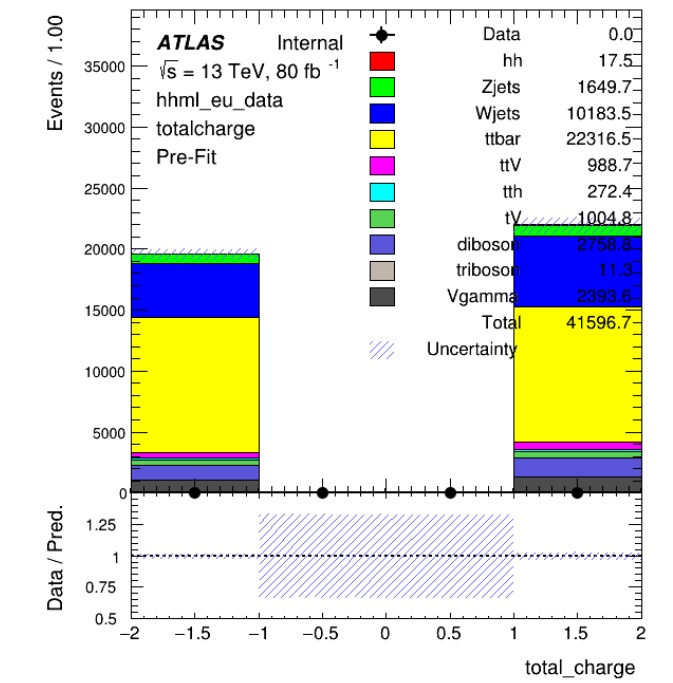

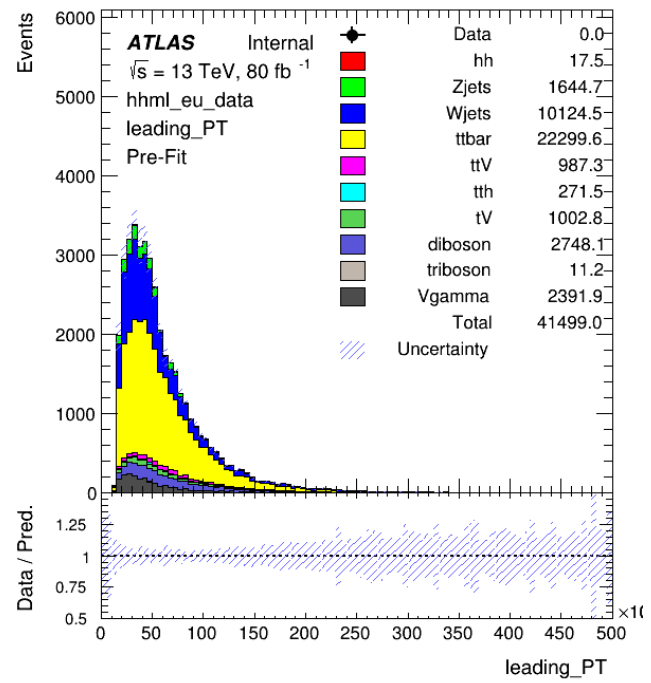

Need produce GN2 by myself
GN1 sample as input : ~ 2TB

Draw MC/Data plots with TRexFitter

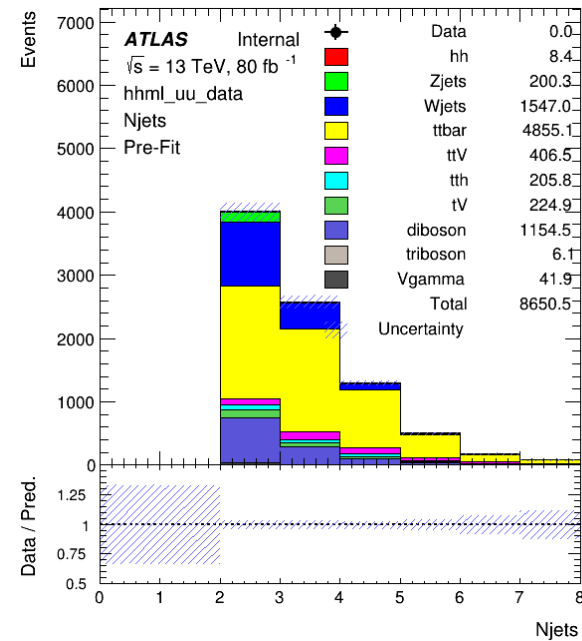

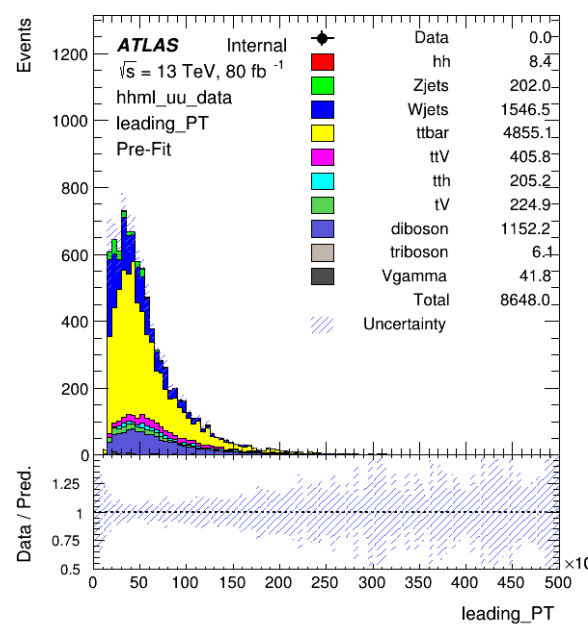

ee

eu

uu

Problems

- Big problems with Official samples(written at dihiggsmultilepton twiki)
 - Some DSID are unreadable
 - Some DSID are missing, should be 260/4 for bkg/sig \rightarrow 247/3
 - Leak variables :triggers
 - Physics process should be checked.
- Ugly .py .sh code to address string. Need time to polish, make it efficient

Summary and plans

- Muon QmisID can be ignored in this analysis. Investigate latest papers research on it.
- Submit gird jobs to run HHMLFW2
- Update pre-Fit plot. (don't see data). Complete undo list , add pt and PLV cut (M.Nazlim selection optimization works)
- Try to read MC truth information to figure out the bkg composition

lep_isTruthMatched_0 ,lep_truthType_0 ,lep_truthOrigin_0,lep_truthPdgId_0 ,lep_truthStatus_0
