# Pentaquarks from hidden－strange to hidden－bottom systems 

Hongxia Huang（黄虹霞） Nanjing Normal University

$6^{\text {th }}$ workshop on the XYZ particles
Fudan University，2020．1．11－2020．1．13

## Outline

I. Introduction
II. Quark model and calculation methods
III. Hidden-charm pentaquarks
IV. Hidden-bottom pentaquarks
V. Hidden-strange pentaquarks
VI. Summary

## I. Introduction

## - Experimental results

- 2015 LHCb Collaboration, Phys. Rev. Lett. 115, 072001

- The two $P_{c}^{+}$states are found to have masses and widths of

$$
\begin{aligned}
& M_{P_{c}(4380)}=4380 \pm 8 \pm 29 \mathrm{MeV} \\
& \Gamma_{P_{c}(4380)}=205 \pm 18 \pm 86 \mathrm{MeV} \\
& M_{P_{c}(4450)}=4449.8 \pm 1.7 \pm 2.5 \mathrm{MeV} \\
& \Gamma_{P_{c}(4450)}=39 \pm 5 \pm 19 \mathrm{MeV}
\end{aligned}
$$

- The preferred spin-parity $J^{P}$ are of opposite values, with one state having spin $3 / 2$ and the other $5 / 2$.
- 2019 LHCb Collaboration, Phys. Rev. Lett. 122222001

Figure 6: Fit to the $\cos \theta_{P_{C}}$-weighted $m_{J / \psi_{p}}$ distribution with three BW amplitudes and a sixth-order polynomial background. This fit is used to determine the central values of the masses superimposed.

- The Pc(4312) was discovered with $7.3 \sigma$ significance by analyzing the $J / \psi p$ invariant mass spectrum.
- The previously reported $\operatorname{Pc}(4450)$ structure was resolved at $5.4 \sigma$ significance into two narrow states: the $P c(4440)$ and $P c(4457)$.

Table 1: Summary of $P_{c}^{+}$properties. The central values are based on the fit displayed in Fig. 6.

| State | $M[\mathrm{MeV}]$ | $\Gamma[\mathrm{MeV}]$ | $(95 \% \mathrm{CL})$ | $\mathcal{R}[\%]$ |
| :---: | :---: | ---: | :---: | :---: |
| $P_{c}(4312)^{+}$ | $4311.9 \pm 0.7_{-0.6}^{+6.8}$ | $9.8 \pm 2.7_{-4.5}^{+3.7}$ | $(<27)$ | $0.30 \pm 0.07_{-0.09}^{+0.34}$ |
| $P_{c}(4440)^{+}$ | $4440.3 \pm 1.3_{-4.7}^{+4.1}$ | $20.6 \pm 4.9_{-10.1}^{+8.7}$ | $(<49)$ | $1.11 \pm 0.33_{-0.10}^{+0.22}$ |
| $P_{c}(4457)^{+}$ | $4457.3 \pm 0.6_{-1.7}^{+4.1}$ | $6.4 \pm 2.0_{-1.9}^{+5.7}$ | $(<20)$ | $0.53 \pm 0.16_{-0.13}^{+0.15}$ |

## > Theoretical studies

- After LHCb's Pc results (2015)

1) Loosely bound molecular baryon-meson pentaquark states:
M. Karliner and J. L. Rosner, Phys. Rev. Lett. 115, 122001 (2015).
R. Chen, X. Liu, X.-Q. Li, S.-L. Zhu, Phys.Rev.Lett. 115, no.13, 132002 (2015).
H. X. Chen, W. Chen, X. Liu, T.G. Steele and S. L. Zhu, Phys.Rev.Lett. 115, no.17, 172001 (2015) .
L. Roca, J. Nieves and E. Oset, Phys. Rev. D 92, 094003 (2015).
J. He, Phys.Lett. B753, 547-551 (2016) .
H. X. Huang, C. R. Deng, J. L. Ping, and F. Wang, Eur. Phys. J. C 76, 624 (2016).
H. X. Huang and J. L. Ping, Phys. Rev. D 99, 014010 (2019).
G. Yang and J. L. Ping, Phys. Rev. D 95, 010014 (2017).
A. Feijoo, V. K. Magas, A. Ramos and E. Oset, Phys. Rev. D 95, no.3, 039905 (2017). and others.

## 2) Tightly bound pentaquark states

L. Maiani, A.D. Polosa, and V. Riquer, Phys.Lett. B 749, 289-291 (2015).
R. F. Lebed, Phys.Lett. B 749, 454-457 (2015).
G.-N. Li, X.-G. He, M. He, JHEP 1512, 128 (2015).
Z.-G. Wang, Eur. Phys. J. C 76, no.2, 70 (2016).
R. Zhu and C. F. Qiao, Phys.Lett. B 756, 259 (2016).
V. V. Anisovich et al., arXiv:1507.07652.
R. Ghosh, A. Bhattacharya, and B. Chakrabarti, Phys. Part. Nucl. Lett. 14, 550 (2017).
and others.
3) Peaks due to triangle-diagram processes
F.-K. Guo, U.-G. Meißner, W. Wang, and Z. Yang, Phys. Rev. D 92, 071502(R) (2015).
U.-G. Meißner and J. A. Oller, Phys. Lett. B 751, 59 (2015).
X.-H. Liu, Q. Wang, and Q. Zhao, Phys. Lett. B 757, 231 (2016).
Q. Wang, X.-H. Liu, and Q. Zhao, Phys.Rev. D92, 034022 (2015).
M. Mikhasenko, arXiv:1507.06552.
and others.

- Immediately after LHCb's Pc results (2019)
R. Chen, X. Liu, Z.-F. Sun, and S.-L. Zhu, arXiv:1903.11013 [hep-ph].
F. K. Guo, H. J. Jing, U.-G. Meissner, and S. Sakai, arXiv:1903.11503 [hep-ph].
J. He, arXiv:1903.11872 [hep-ph].

Hua-Xing Chen, Wei Chen, Shi-Lin Zhu, arXiv: 1903.11001 [hep-ph].
H. X. Huang, J. He, and J. L. Ping, arXiv: 1904.00221 [hep-ph].
C. J. Xiao, Y. Huang, Y. B. Dong, L. S. Geng, and D. Y. Chen, arXiv:1904.00872 [hep-ph].
M. Z. Liu, Y. W. Pan, F. Z. Peng, M. S. Sanchez, L. S. Geng, A. Hosaka, and M. P.

Valderrama, , Phys. Rev. Lett. 122, 242001 (2019)
and others.

## - Some early studies

J. J. Wu, R. Molina, E. Oset and B. S. Zou, Phys. Rev. Lett. 105, 232001 (2010) [arXiv:1007.0573 [nucl-th]].
J. J. Wu, R. Molina, E. Oset and B. S. Zou, Phys. Rev. C 84, 015202 (2011) [arXiv:1011.2399 [nucl-th]].
J. J. Wu, T.-S. H. Lee and B. S. Zou, Phys. Rev. C 85, 044002 (2012) [arXiv:1202.1036 [nucl-th]].
Z. C. Yang, Z. F. Sun, J. He, X. Liu and S. L. Zhu, Chin. Phys. C 36, 6 (2012)
[arXiv:1105.2901 [hep-ph]].
and others.

- The $N \phi$ bound state was first studied by H. Gao .

PRC 63 (2001) 022201(R)
The QCD van der Waals attractive potential is strong enough to bind a $\phi$ meson onto a nucleon inside a nucleus to form a bound state.

- The feasibility of experimental search for the $N \phi$ bound state at Jefferson Lab was demonstrated by H. Gao .

PRC 75 (2007) 058201

- Measurement of coherent $\phi$-meson photoproduction from the deuteron.

CLAS Collaboration, PRC 76 (2007) 052202(R)
PLB 680 (2009) 417-422, PLB 696 (2011) 338-342

- The $\mathrm{N} \phi$ was a quasi-bound state in the extended chiral $\mathrm{SU}(3)$ quark model.

PRC 73 (2006) 025207

## $>$ Our work

1) Hidden-charm pentaquark
2) Hidden-bottom pentaquark

Eur. Phys. J. C. 76, 624 (2016), arXiv: 1510.04648.
Phys. Rev. D. 99, 014010 (2019) , arXiv: 1811.04260.
3) Hidden-strange pentaquark

Phys. Rev. C. 95, 055202 (2017) , arXiv: 1701.03210.
Phys. Rev. D. 97, 094019 (2018) , arXiv: 1803.05267.

## II. Quark model and calculation methods

> Quark delocalization color screening model (QDCSM)

- QDCSM was developed by Nanjing-Los Alamos collaboration in1990s aimed to multi-quark study. (PRL 69, 2901, 1992)
- Two new ingredients (based on quark cluster model configuration):
quark delocalization (orbital excitation)
color screening (color structure)
- Apply to the study of baryon-baryon interaction and dibaryons

```
deuteron, d*, NN, N\Lambda, N\Omega, ...
```

- Apply to the study of baryon-meson interaction and pentaquarks
NK, Npi, ...

$$
H=\sum_{i=1}^{5}\left(m_{i}+\frac{p_{i}^{2}}{2 m_{i}}\right)-T_{c}+\sum_{i<j}\left[V^{G}\left(r_{i j}\right)+V^{x}\left(r_{i j}\right)+V^{C}\left(r_{i j}\right)\right]
$$

$$
V^{G}\left(r_{i j}\right)=\frac{1}{4} \alpha_{s} \lambda_{i} \cdot \lambda_{j}\left[\frac{1}{r_{i j}}-\frac{\pi}{2}\left(\frac{1}{m_{i}^{2}}+\frac{1}{m_{j}^{2}}+\frac{4 \sigma_{i} \cdot \sigma_{j}}{3 m_{i} m_{j}}\right) \delta\left(r_{i j}\right)-\frac{3}{4 m_{i} m_{j} r_{i j}^{r_{i j}}} S_{i j}\right],
$$

$$
V^{\chi}\left(r_{i j}\right)=\frac{1}{3} \alpha_{c h} \frac{\Lambda^{2}}{\Lambda^{2}-m_{\chi}^{2}} m_{\chi}\left\{\left[Y\left(m_{\chi} r_{i j}\right)-\frac{\Lambda^{3}}{m_{\chi}^{3}} Y\left(\Lambda r_{i j}\right)\right] \sigma_{i} \cdot \sigma_{j}+\left[H\left(m_{\chi} r_{i j}\right)-\frac{\Lambda^{3}}{m_{\chi}^{3}} H\left(\Lambda r_{i j}\right)\right] S_{i j}\right\} \mathbf{F}_{i} \cdot \mathbf{F}_{j}, \quad \chi=\pi, K, \eta,
$$

$$
V^{C}\left(r_{i j}\right)=-a_{c} \lambda_{i} \cdot \lambda_{j}\left[f\left(r_{i j}\right)+V_{0}\right],
$$

$$
f\left(r_{i j}\right)= \begin{cases}r_{i j}^{2} & \text { if } i, \text { joccur in the same baryon orbit, } \\ \frac{1-e^{-\mu_{j} i_{i j}^{2}}}{\mu_{i j}} & \text { if } i, \text { joccur in different baryon orbits }\end{cases}
$$

$$
\begin{equation*}
S_{i j}=\frac{\left(\sigma_{i} \cdot \mathbf{r}_{i j}\right)\left(\sigma_{j} \cdot \mathbf{r}_{i j}\right)}{r_{i j}^{2}}-\frac{1}{3} \sigma_{i} \cdot \sigma_{j}, \tag{1}
\end{equation*}
$$

$$
\begin{aligned}
\psi_{\alpha}\left(s_{i}, \epsilon\right) & =\left(\phi_{\alpha}\left(s_{i}\right)+\epsilon \phi_{\alpha}\left(-s_{i}\right)\right) / N(\epsilon), \\
\psi_{\beta}\left(-s_{i}, \epsilon\right) & =\left(\phi_{\beta}\left(-s_{i}\right)+\epsilon \phi_{\beta}\left(s_{i}\right)\right) / N(\epsilon),
\end{aligned}
$$

$$
\begin{aligned}
N(\epsilon) & =\sqrt{1+\epsilon^{2}+2 \epsilon e^{-s_{i}^{2} / 4 b^{2}}} \\
\phi_{\alpha}\left(s_{i}\right) & =\left(\frac{1}{\pi b^{2}}\right)^{3 / 4} e^{-\frac{1}{2 b^{2}}\left(r_{\alpha}-\frac{2}{5} s_{i} / 2\right)^{2}} \\
\phi_{\beta}\left(-s_{i}\right) & =\left(\frac{1}{\pi b^{2}}\right)^{3 / 4} e^{-\frac{1}{2 b^{2}}\left(r_{\beta}+\frac{3}{5} s_{i} / 2\right)^{2}}
\end{aligned}
$$

## $>$ Calculation methods

## (1) Resonating group method (RGM)

In RGM, the multi-quark wave function is approximated by the cluster wave function,

$$
\psi\left(\xi_{1}, \xi_{2}, \boldsymbol{R}\right)=\mathcal{A}\left[\phi\left(\xi_{1}\right) \phi\left(\xi_{2}\right) \chi(\boldsymbol{R})\right]
$$

The internal motions of clusters are frozen and the relative motion wave function satisfies the following RGM equation

$$
\int H\left(R^{\prime \prime}, R^{\prime}\right) \chi\left(R^{\prime}\right) d R^{\prime}=E \int N\left(R^{\prime \prime}, R^{\prime}\right) \chi\left(R^{\prime}\right) d R^{\prime}
$$

$$
\left\{\begin{array}{c}
H\left(R^{\prime \prime}, R^{\prime}\right) \\
N\left(R^{\prime \prime}, R^{\prime}\right)
\end{array}\right\}=\left\langle A\left[\phi_{1} \phi_{2} \delta\left(R-R^{\prime \prime}\right)\right]\right|\left\{\begin{array}{c}
H \\
1
\end{array}\right\}\left|A\left[\phi_{1} \phi_{2} \delta\left(R-R^{\prime}\right)\right]\right\rangle
$$

## RGM equation

$$
\int L\left(R^{\prime \prime}, R^{\prime}\right) \chi\left(R^{\prime}\right) d R^{\prime}=0
$$

where

$$
L\left(R^{\prime \prime}, R^{\prime}\right)=H\left(R^{\prime \prime}, R^{\prime}\right)-E N\left(R^{\prime \prime}, R^{\prime}\right)
$$

$$
=\left[-\frac{\nabla_{R^{\prime \prime}}^{2}}{2 \mu}+V_{r e l}^{D}\left(R^{\prime}\right)-E_{r e l}\right] \delta\left(R^{\prime \prime}-R^{\prime}\right)+H^{E X}\left(R^{\prime \prime}, R^{\prime}\right)-E N^{E X}\left(R^{\prime \prime}, R^{\prime}\right)
$$

## (2) Generating coordinates method (GCM)

Extending the relative motion wave function to the Gaussian function:

$$
\chi(\vec{R})=\sum_{i} C_{i} \chi_{i}(\vec{R})=\left(\frac{3}{2 \pi b^{2}}\right)^{3 / 4} \sum_{i} C_{i} e^{-\frac{3}{4}\left(\vec{R}-\xi_{i}\right)^{2} / b^{2}}
$$

$$
\phi_{C}\left(\overrightarrow{R_{C}}\right)=\left(\frac{6}{\pi b^{2}}\right)^{\frac{3}{4}} e^{-\frac{3}{b^{2}}\left(\overrightarrow{R_{c}}\right)^{2}}
$$

$$
\begin{aligned}
\Psi_{6 q}= & A \sum_{i} C_{i} \prod_{\alpha=1}^{3} \phi_{\alpha}\left(\vec{S}_{i}\right) \prod_{\beta=4}^{6} \phi_{\beta}\left(-\vec{S}_{i}\right) \\
& {\left[\eta_{I_{1} S_{1}}\left(B_{1}\right) \eta_{I_{2} S_{2}}\left(B_{2}\right)\right]^{I S}\left[\chi_{c}\left(B_{1}\right) \chi_{c}\left(B_{2}\right)\right]^{[\sigma]} }
\end{aligned}
$$

$$
\begin{aligned}
\Psi_{6 q}= & A \sum_{k} \sum_{i, L_{k}} C_{k, i, L_{k}} \int \frac{d \Omega_{S_{i}}}{\sqrt{4 \pi}} \prod_{\alpha=1}^{3} \psi_{\alpha}\left(\vec{S}_{i}, \epsilon\right) \prod_{\beta=4}^{6} \psi_{\beta}\left(-\vec{S}_{i}, \epsilon\right) \\
& {\left[\left[\eta_{I_{1 k} S_{1 k}}\left(B_{1 k}\right) \eta_{I_{2 k} S_{2 k}}\left(B_{2 k}\right)\right]^{I S_{k}} Y^{L_{k}}\left(\hat{\vec{S}}_{i}\right)\right]^{J}\left[\chi_{C}\left(B_{1}\right) \chi_{c}\left(B_{2}\right)\right]^{[\sigma]} }
\end{aligned}
$$

$$
\begin{gathered}
\int H\left(\vec{R}, \vec{R}^{\prime}\right) \chi\left(\vec{R}^{\prime}\right) d \vec{R}^{\prime}=E \int N\left(\vec{R}, \overrightarrow{R^{\prime}}\right) \chi\left(\vec{R}^{\prime}\right) d \vec{R}^{\prime} \\
\sum_{j, k, L_{k}} C_{j, k, L_{k}} H_{i, j}^{k^{\prime}, L_{k}^{\prime}, k, L_{k}}=E \sum_{j, k, L_{k}} C_{j, k, L_{k}} N_{i, j}^{k^{\prime}, L_{k}^{\prime}, k, L_{k}} \delta_{L_{k}^{\prime}, L_{k}}
\end{gathered}
$$

## (2) Kohn-Hulthen-Kato(KHK) variational method

$$
\begin{aligned}
& u_{t}(R)=\sum_{i=0}^{n} c_{i} u_{i}(R) \\
& u_{i}(R)= \begin{cases}\alpha_{i} u_{i}^{(i n)}(R), & R<R_{c}, \\
\left(h_{L}^{(-)}(k, R)+s_{i} h_{L}^{(+)}(k, R)\right) R, & R>R_{c}\end{cases}
\end{aligned}
$$

$$
\frac{u_{i}^{(i n)}(R)}{R}=\sqrt{4 \pi}\left(\frac{3}{2 \pi b^{2}}\right)^{\frac{3}{4}} e^{-\frac{3}{4 b^{2}}\left(R^{2}+r_{i}^{2}\right)} i^{L} j_{L}\left(-i \frac{3}{2 b^{2}} R r_{i}\right)
$$

$$
\sum_{i=1}^{n} a_{i=1},
$$

$$
\sum_{i=0}^{n}, s_{i}=S_{t}
$$

$$
c_{0}=1-\sum_{i=1}^{n} c_{i} \Longrightarrow u_{t}(R)=u_{0}(R)+\sum_{i=1}^{n} c_{i}\left(u_{i}(R)-u_{0}(R)\right)
$$

$$
\begin{gathered}
\left\langle\delta \Psi^{\prime}\right| H-E|\Psi\rangle=0 \\
\sum_{j=1}^{n} \mathcal{L}_{i j} c_{j}=\mathcal{M}_{i},(i=1 \sim n) \\
\mathcal{L}_{i j}=\mathcal{K}_{i j}-\mathcal{K}_{i 0}-\mathcal{K}_{0 j}+\mathcal{K}_{00} \\
\mathcal{M}_{i}=\mathcal{K}_{00}-\mathcal{K}_{i 0}
\end{gathered}
$$

$\mathcal{K}_{i j}=\left\langle\phi_{A}\left(\xi_{A}\right) \phi_{B}\left(\xi_{B}\right) u_{i}(R) / R \cdot Y_{L M}(\hat{R})\right| H-E\left|\mathcal{A}\left[\phi_{A}\left(\xi_{A}\right) \phi_{B}\left(\xi_{B}\right) u_{j}(R) / R \cdot Y_{L M}(\hat{R})\right]\right\rangle$

## Some examples

2). $\Delta$ mass and width in Npi scattering

$$
\mathrm{MO}=1525 \mathrm{MeV} \longrightarrow \quad M=1232 \mathrm{MeV}, \Gamma \sim 90 \mathrm{MeV}
$$

$\checkmark$ The mass of the resonance state will shift by coupling to the open channel. It is better to study the resonances in the scattering process rather than in the limited space.
$\checkmark$ Extending the work to the other pentaquark systems is feasible.

## III. Hidden-charm pentaquarks

- The hidden charm pentaquark channels with I=1/2

Table 3 The channels involved in the calculation

| $S=\frac{1}{2}$ | $N \eta_{c}$ | $N J / \psi$ | $\Lambda_{c} D$ | $\Lambda_{c} D^{*}$ | $\Sigma_{c} D$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  | $\Sigma_{c} D^{*}$ | $\Sigma_{c}^{*} D^{*}$ |  |  |  |
| $S=\frac{3}{2}$ | $N J / \psi$ | $\Lambda_{c} D^{*}$ | $\Sigma_{c} D^{*}$ | $\Sigma_{c}^{*} D$ | $\Sigma_{c}^{*} D^{*}$ |
| $S=\frac{5}{2}$ | $\Sigma_{c}^{*} D^{*}$ |  |  |  |  |

$\checkmark$ The state with the positive parity is unbound in present calculations.

- The effective potentials

Fig. 1 The potentials of different channels for the $I J^{P}=\frac{1}{2}^{\frac{1}{2}}-$ system

Fig. 2 The potentials of different channels for the $I J^{P}=\frac{1}{2} \frac{3^{-}}{}{ }^{-}$system

Fig. 3 The potential of a single channel for the $I J^{P}=\frac{1}{2}^{\frac{5}{2}}$ - system
$\checkmark$ The potentials are repulsive between $\Lambda c$ and $D / D^{*}$. So no bound states or resonances can be formed in these two channels $\Lambda c D$ and $1 c D^{*}$.
Strong attractions between $\Sigma c / \Sigma c^{*}$ and $D / D^{*}$.
$\checkmark$ It is possible for $\Sigma c / \Sigma c^{*}$ and D/ D* to form bound states or resonance states.

- The single channel calculation

| $J^{p}=\frac{1}{2}^{-}$ |  |  |  | $J^{p}=\frac{3}{2}^{-}$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mu_{c c}$ | 0.01 | 0.001 | 0.0001 | $\mu_{c C}$ | 0.01 | 0.001 | 0.0001 |
| $N \eta_{c}$ | ub | ub | ub | $N J / \psi$ | ub | ub | ub |
| NJ/ $\psi$ | ub | ub | ub | ${ }^{5} \mathrm{C}^{-D^{*}}$ | ub | ub | ub |
| $\Lambda_{c} D$ | ub | ub | ub | $\Sigma_{C} D^{*}$ | -16/4446 | -11/4451 | -10/4452 |
| $\Lambda_{c} D^{*}$ | ub | ub | ub | $\Sigma_{r}^{*} D$ | -17/4367 | -14/4370 | -12/4372 |
| $\Sigma_{C} D$ | -19/4300 | $-15 / 4304$ | $-13 / 4306$ | $\Sigma^{*} D^{*}$ | $-17 / 4510$ | -15/4512 | $-13 / 4514$ |
| $\Sigma_{c} D^{*}$ | $-21 / 4441$ | $-19 / 4443$ | $-18 / 4444$ | $J^{p}=\frac{5}{2}$ |  |  |  |
| $\Sigma_{c}^{*} D^{*}$ | -24/4503 | -23/4504 | -21/4506 | $\Sigma^{*} D^{*}$ | $-15 / 4512$ | -10/4517 | $-10 / 4517$ |

Comparing with the LHCb's result in 2015
The main component of the $\operatorname{Pc}(4380)$ maybe $\Sigma c^{*} \mathrm{D}$ with $J^{P}=3 / 2^{-}$.
$\checkmark$ The mass of the $\Sigma c D^{*}$ with $J^{P}=3 / 2^{-}$is close to the reported $\operatorname{Pc}(4450)$, but the opposite parity of this state to $\operatorname{Pc}(4380)$ may prevent one from making this assignment at that time.

## - The channel-coupling calculation

$\checkmark$ A bound state: $J^{P}=1 / 2^{-} \mathrm{Nnc}$
$\checkmark J^{P}=3 / 2^{-} \mathrm{NJ} / \psi$ (decayto open channels: $D$-wave $N \eta c$ )
$\checkmark J^{P}=5 / 2^{-} \Sigma c^{*} D^{*}$ (decay to open channels: some $D$-wave channels)
$\checkmark$ Where are these states?

$$
\begin{aligned}
& J^{P}=1 / 2^{-} \Sigma c \mathrm{D}, \Sigma \mathrm{CD} D^{*}, \Sigma \mathrm{c}^{*} \mathrm{D}^{*} \quad \text { (decay to open channels: } \mathrm{S} \text {-wave } \mathrm{N} \eta \mathrm{c}, \mathrm{NJ} / \psi, \Lambda c \mathrm{D} \text {, } \\
& \text { ^cD* and some D-wave channels) } \\
& J^{P}=3 / 2^{-} \sum \mathrm{C} * \mathrm{D}, \Sigma \mathrm{CD} *, \sum \mathrm{C}^{*} \mathrm{D}^{*} \quad \text { (decay to open channels: } S \text {-wave } \mathrm{NJ} / \psi, \Lambda c \mathrm{D} * \text { and } \\
& \text { some D-wave channels) }
\end{aligned}
$$

They maybe the resonance states.
To check whether they are resonance states or not, the study of scattering process of the corresponding open channels are needed!

- Resonance states in the scattering process

$$
\text { 1. } J^{P}=1 / 2^{-}
$$

FIG. 2. The $N \eta_{c}, N J / \psi, \Lambda_{c} D$, and $\Lambda_{c} D^{*} S$-wave phase shifts with four-channel coupling for the $I J^{P}=\frac{11}{2} \frac{1}{2}$ system.

- There are three resonance states: $\Sigma c \mathrm{D}, \Sigma \mathrm{c} \mathrm{D}^{*}$, and $\Sigma \mathrm{c}^{*} \mathrm{D}^{*}$ in the N $\eta \mathrm{c}$ scattering phase shifts.
- In other scattering channels there are only two resonance states: $\Sigma c D$ and ᄃcD*.
- There is only a cusp around the threshold of the third state $\sum c^{*} D^{*}$, because the channel coupling pushes the higher state above the threshold.

TABLE II. The masses and decay widths (in MeV) of the $I J^{P}=\frac{11}{2} \frac{1}{-}$ resonance states in the $N \eta_{c}, N J / \psi, \Lambda_{c} D$, and $\Lambda_{c} D^{*} S$-wave scattering process.

2. $J^{P}=3 / 2^{-}$

- There are two resonance states: $\Sigma c^{*} *$ and $\Sigma c^{*} D$ in
the $N J / \psi$ scattering phase states: $\Sigma c D^{*}$ and $\Sigma c^{*} D$ in
the $N J / \psi$ scattering phase shifts.
- There are three resonance states: $\Sigma \mathrm{cD}^{*}, \Sigma \mathrm{c}^{*} \mathrm{D}$ and $\Sigma c^{*} D^{*}$ in the $\Lambda c D^{*}$ scattering phase shifts.

FIG. 4. The $N J / \psi$ and $\Lambda_{c} D^{*} S$-wave phase shifts with fourchannel coupling for the $I J^{P}=\frac{13-}{2}-$ system.
