

# Survey of the TeV gamma ray sky by the LHAASO-WCDA experiment

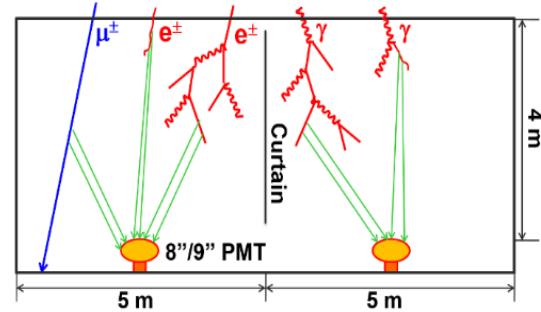

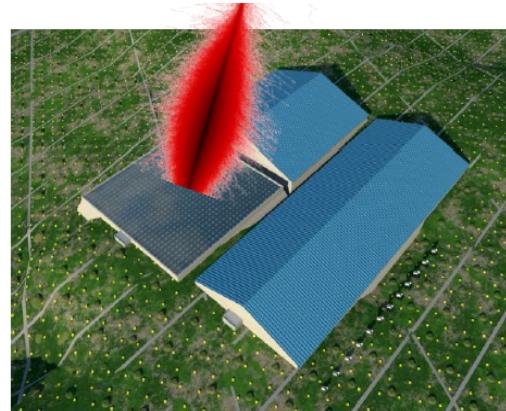

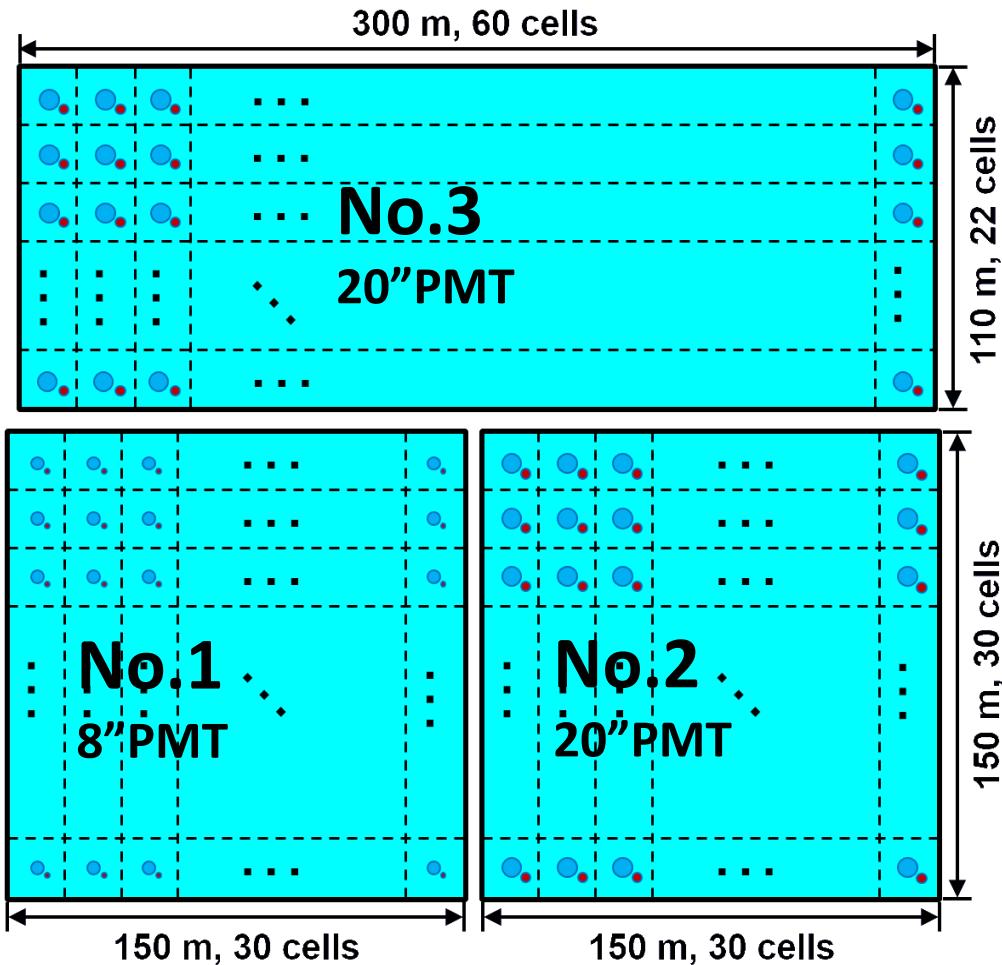

Min Zha @IHEP  
For the LHAASO collaboration

# outline

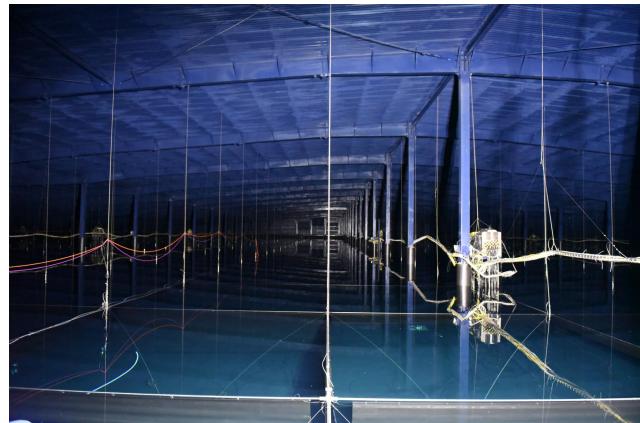

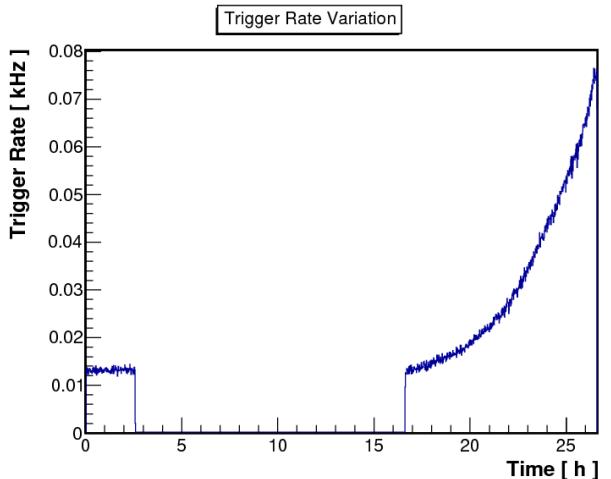

- Water Cherenkov Detector Array status
- Preliminary results from WCDA-1
- Summary and outlook

# LHAASO-WCDA

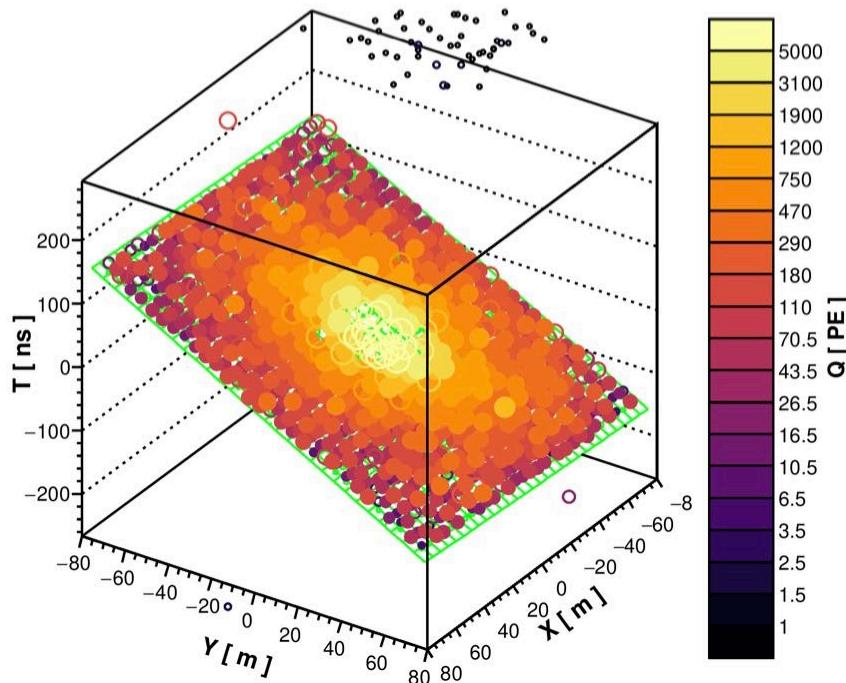

# Timeline of WCDA#1

- 2018/10/22: start deployment;
- 2019/01/10: deployment complete;
- 2019/01/11: start dry data-taking mode;
- 2019/02/25: DAQ with water ;
- 2019/04/07: achieve full water depth;
- 2019/04/26: start scientific data-taking .
- Running mode @ test water running mode
  - 2 hours + multi-mode looping
  - S3:90s E2:30m S3:90s SH4:20m S3:90s E2:30m S3:90s E2:30m
- Normal running mode from 20190511
  - EM17
  - 17 hits within 300 ns;
- GRB + shower mode from 20190604
  - GRBM17
  - To now: 36 GRBs
- B-pmt + S-pmt joint mode from 20191009
  - P1GRBM20M

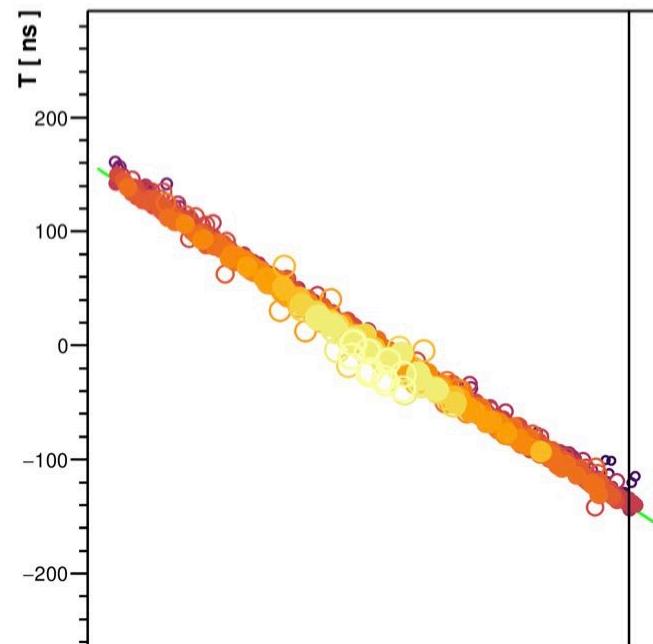

# Valentine day event

20190214/173639/0.180367688: nTrig=0,  $\theta=34.43\pm0.02^\circ$ ,  $\phi=93.67\pm0.03^\circ$

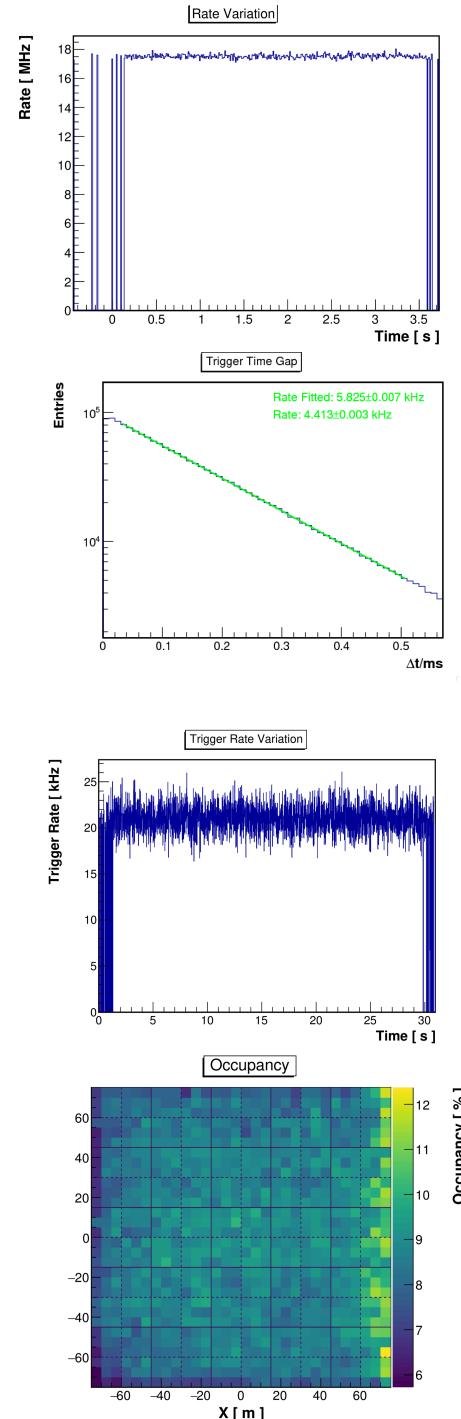

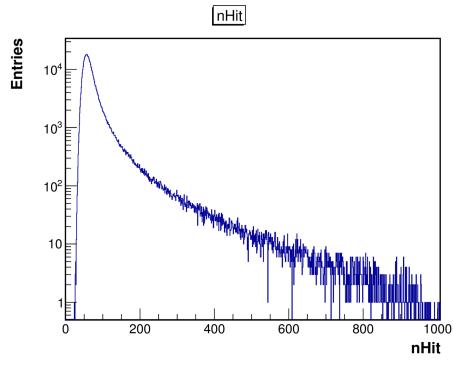

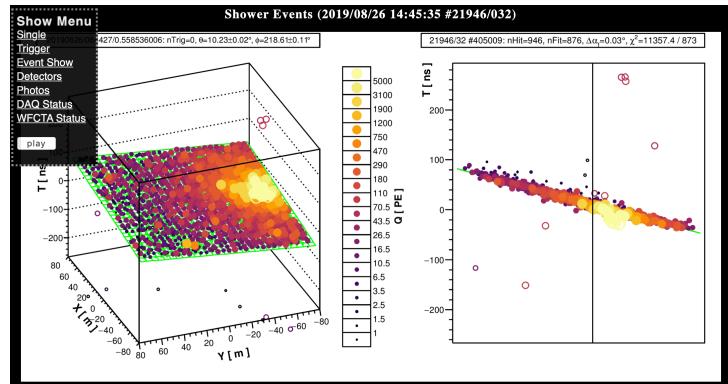

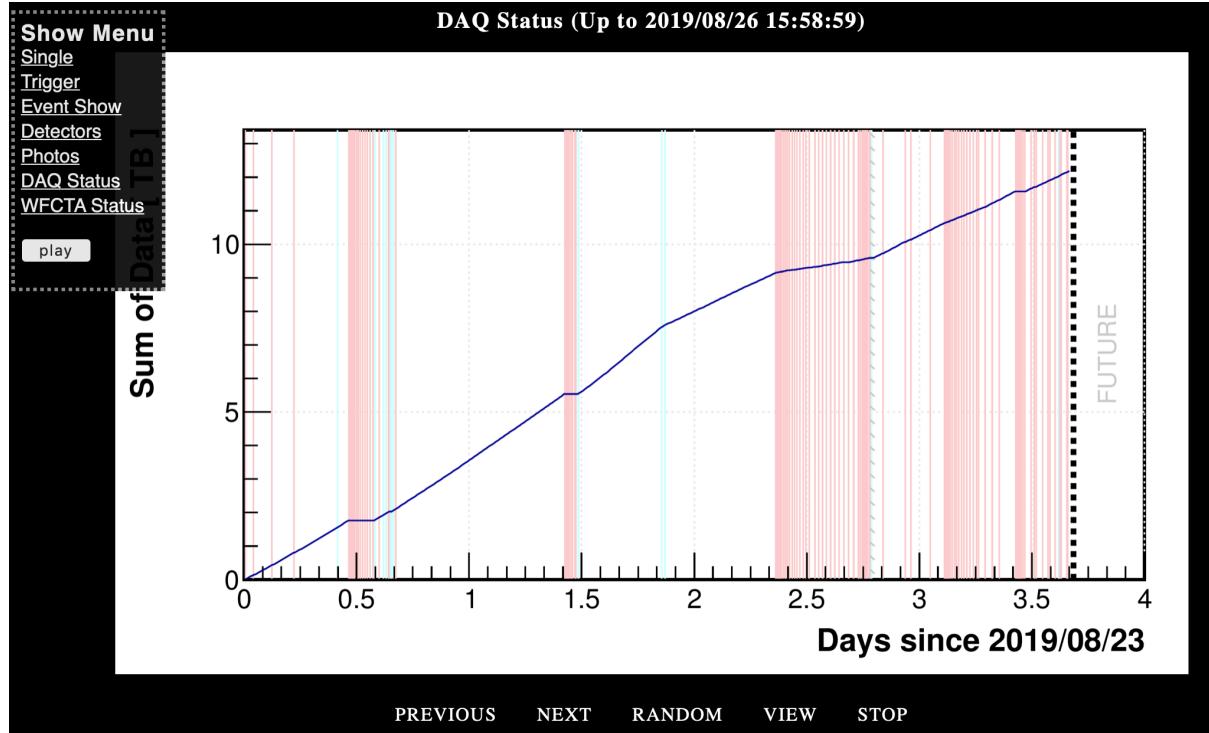

10001/7 #85620: nHit=1687, nFit=784,  $\Delta\alpha_t=0.03^\circ$ ,  $\chi^2=6127.2 / 781$

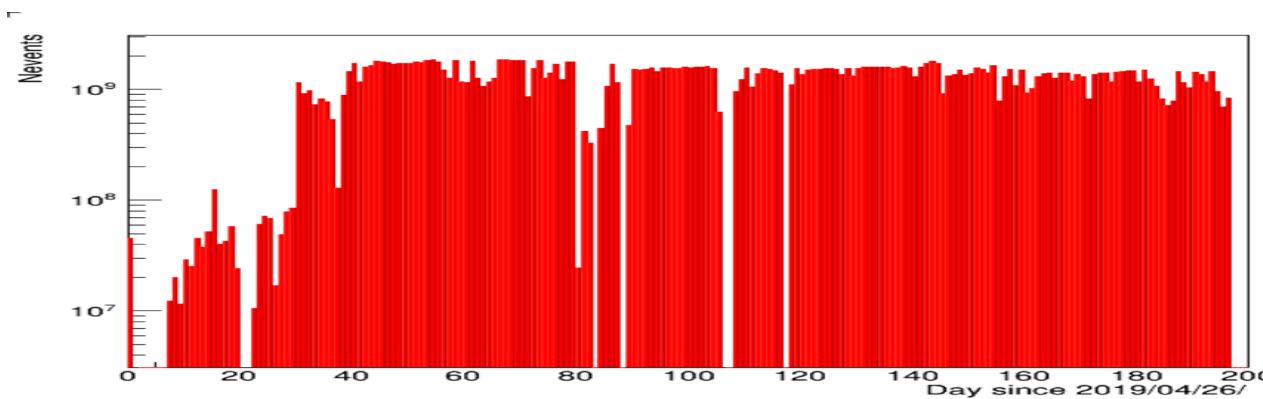

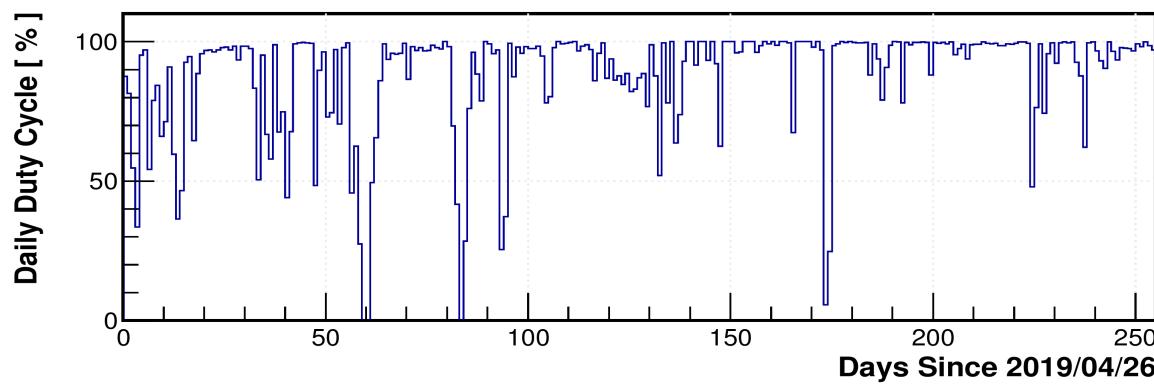

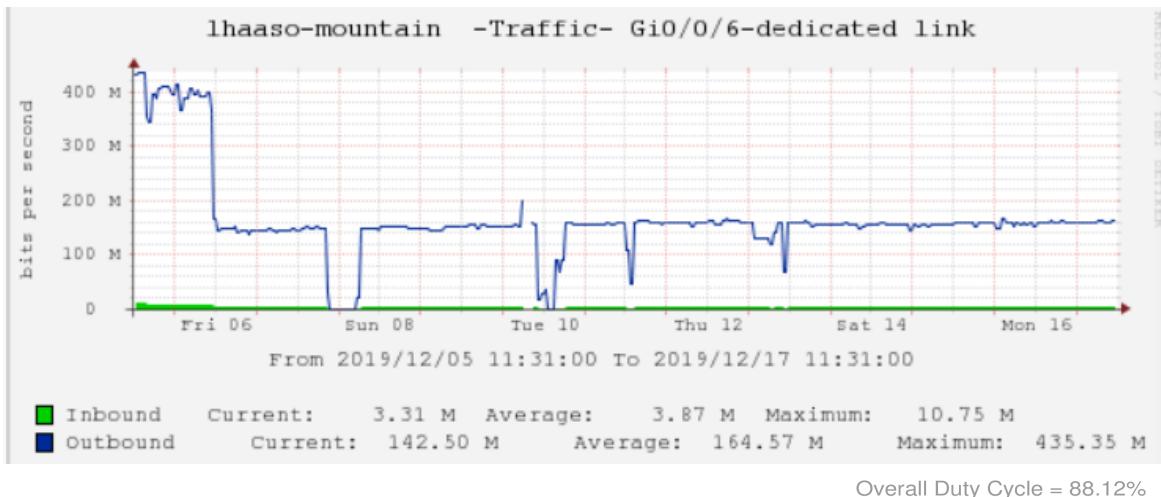

# Data on-line monitor

[http://202.38.128.103:9019/wcda\\_detectors/](http://202.38.128.103:9019/wcda_detectors/)

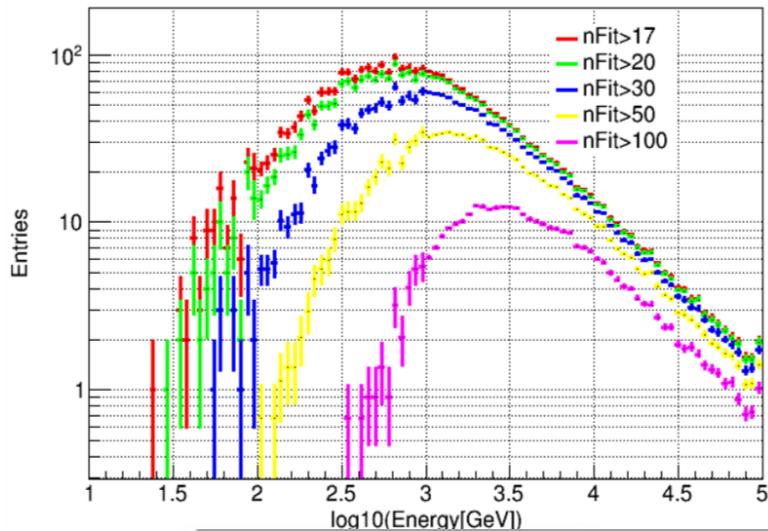

# WCDA-1 data taking

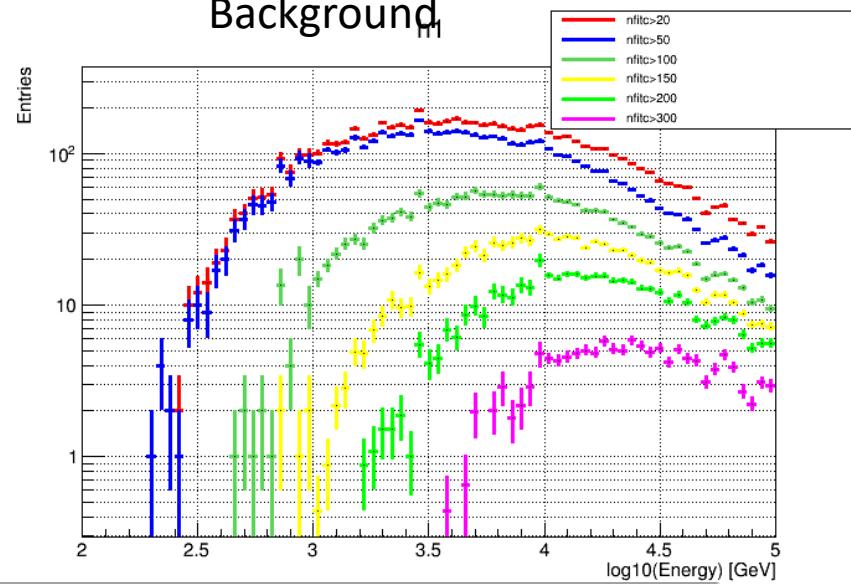

# Data .vs. MC

Gamma-ray@10GeV-100TeV

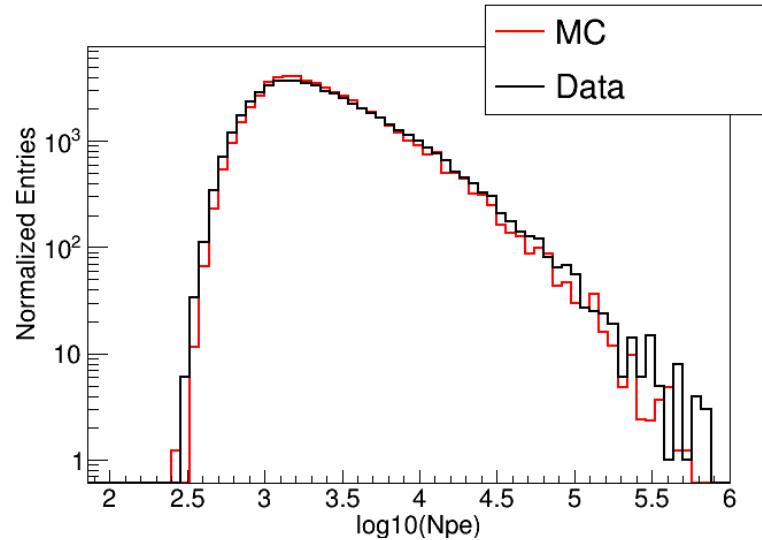

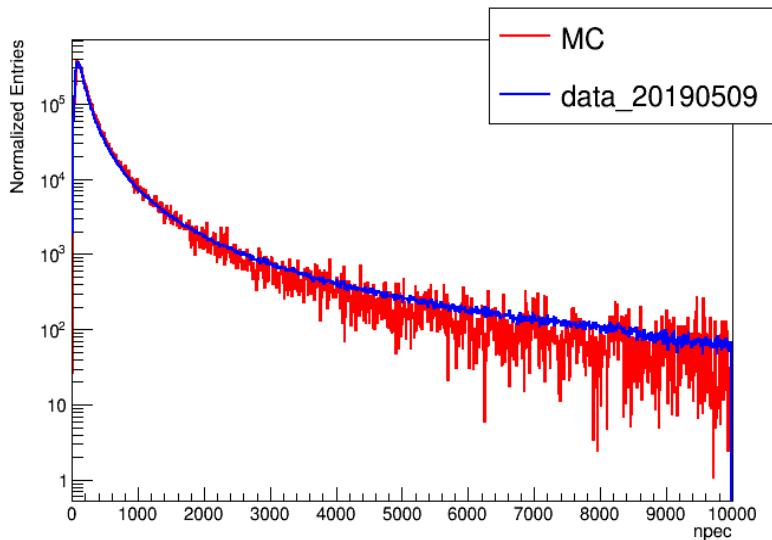

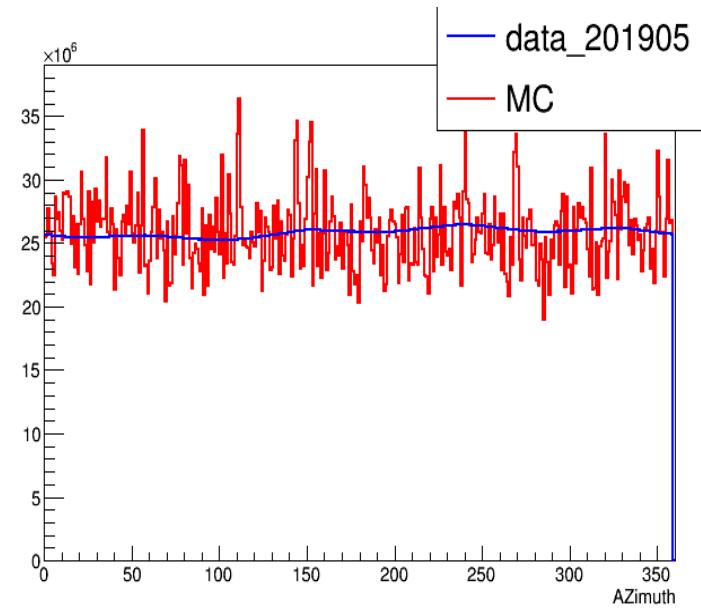

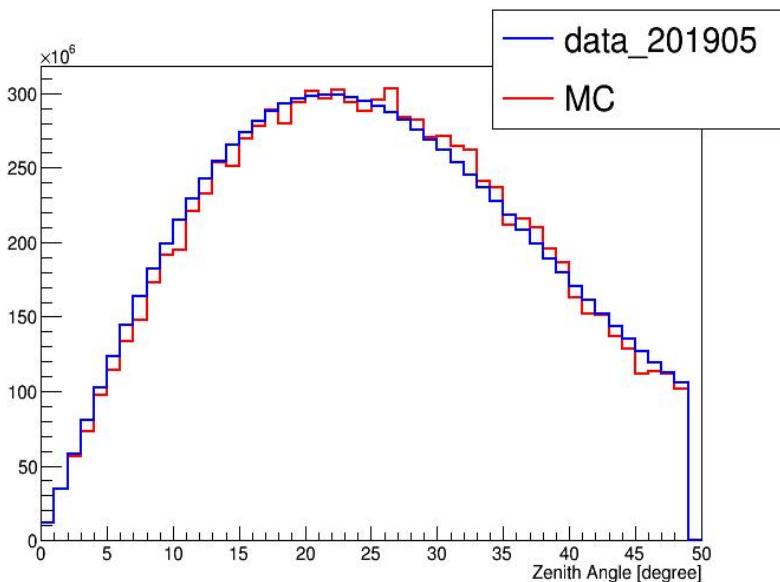

Background

CR	>17 (NHit)	>20 (NHit)	>30 (NHit)	>50 (NHit)	>100 (NHit)
P	13.2 kHz	9.7 kHz	4.7 kHz	1.9 kHz	0.6 kHz
He	4.9 kHz	3.5 kHz	1.7 kHz	0.8 kHz	0.3 kHz
CNO	1.3 kHz	0.9 kHz	0.4 kHz	0.2 kHz	0.07 kHz
MgAlSi	0.6 kHz	0.4 kHz	0.2 kHz	0.08 kHz	0.03 kHz
Fe	0.5 kHz	0.3 kHz	0.16 kHz	0.07 kHz	0.02 kHz
All (8m)	20.5 kHz	15.0 kHz	7.2 kHz	2.9 kHz	1.0 kHz

- The data trigger is about 22.1 kHz and the M.C. is 20.5 kHz, thus the M.C. trigger rate is consistent with data within 8% level.

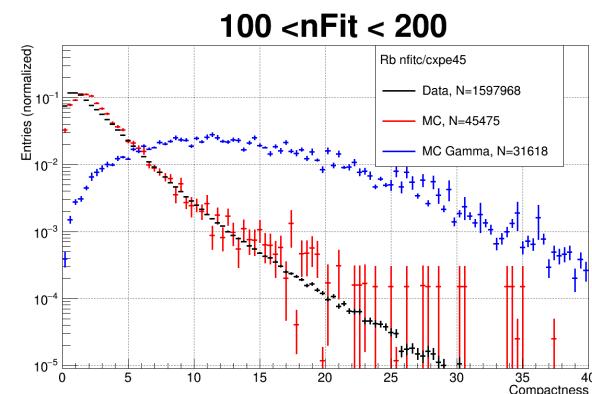

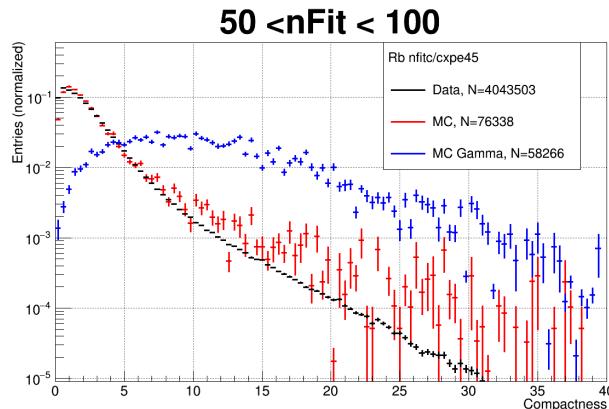

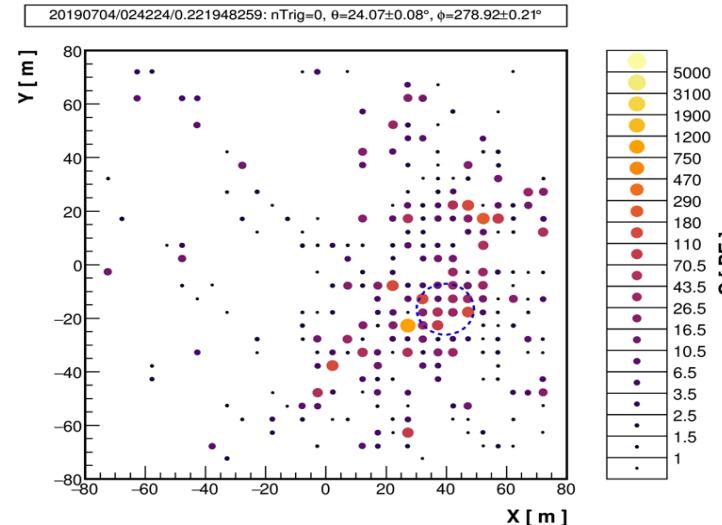

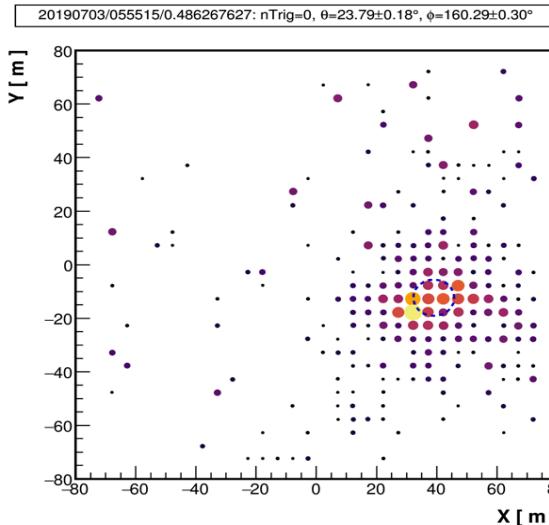

# --continued

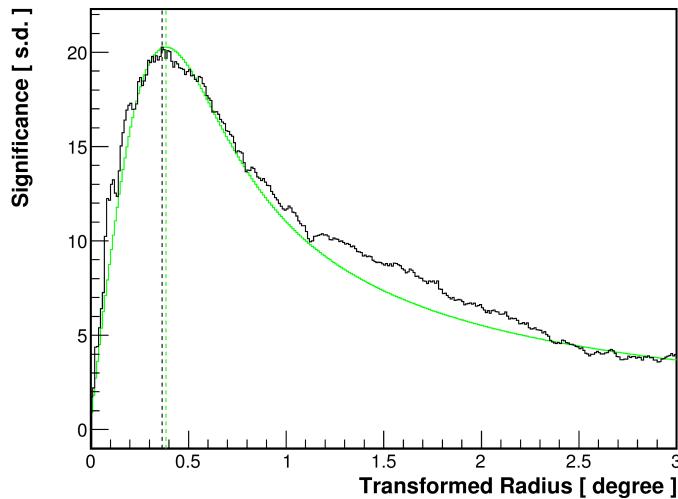

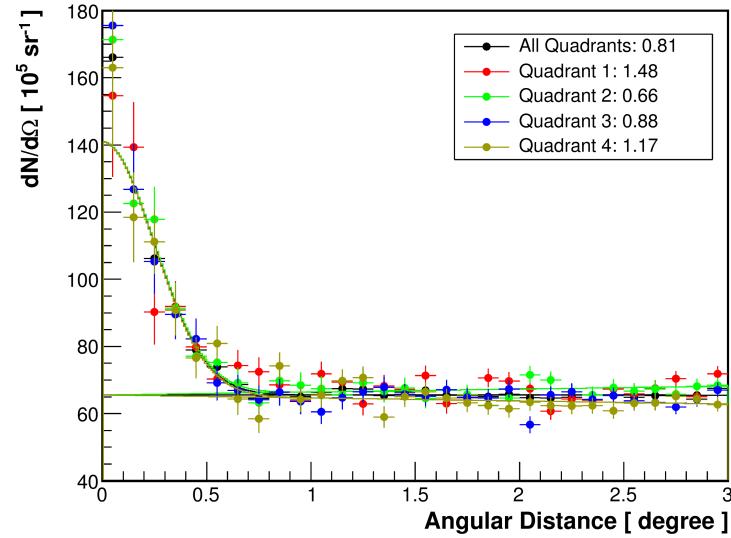

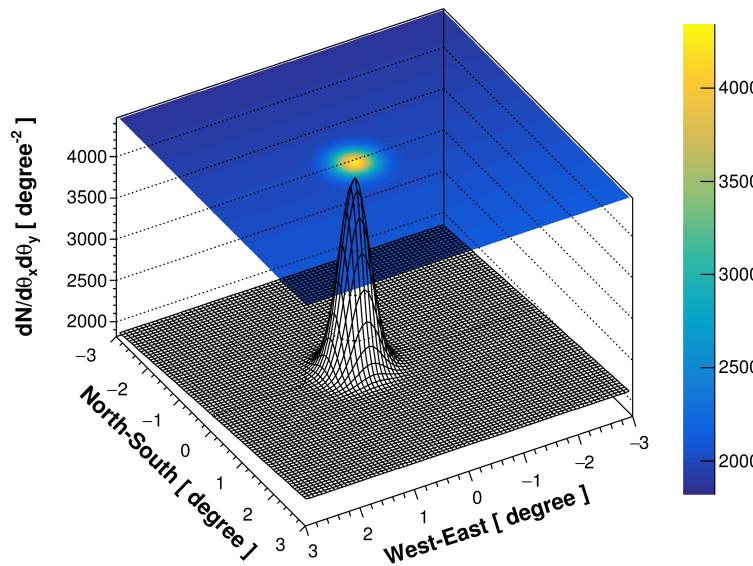

# Background rejection @ compactness

Top3: Nhit=236 C=39

Ptop3: Nhit=261

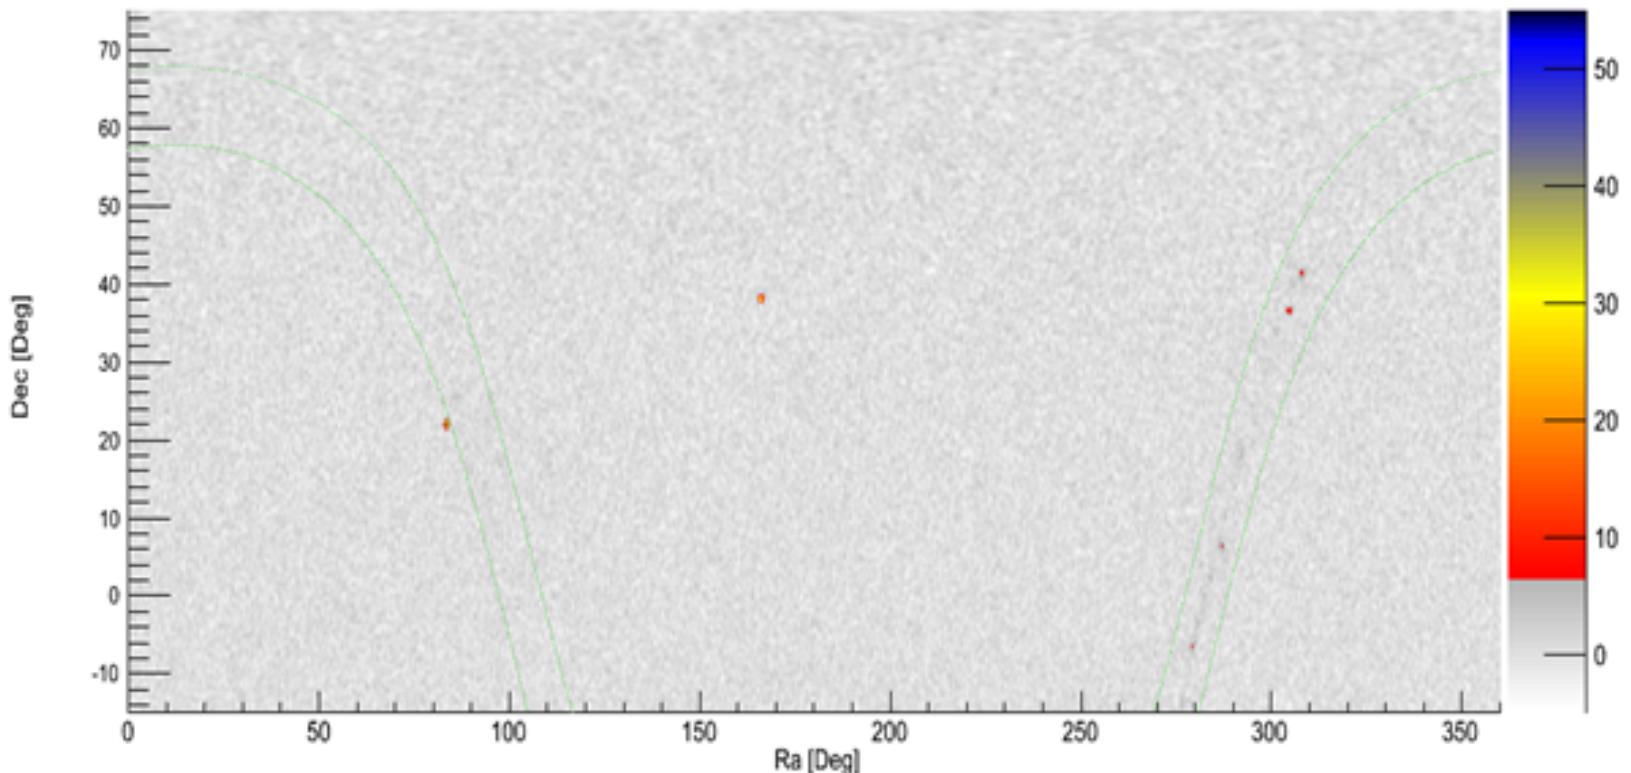

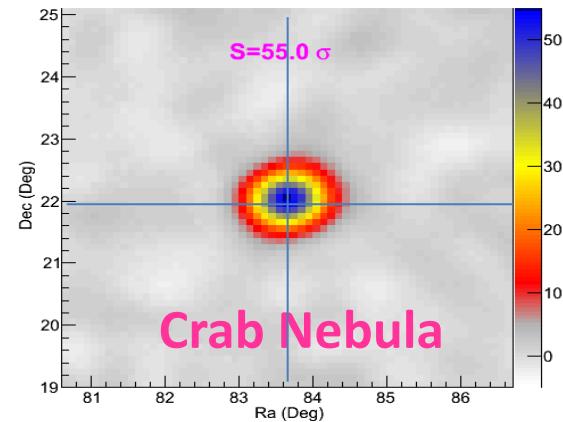

# Crab Nebular observation per month

- 20 sigma/month;
- Sigma is 0.25 deg;
- Pointing is less than 0.1

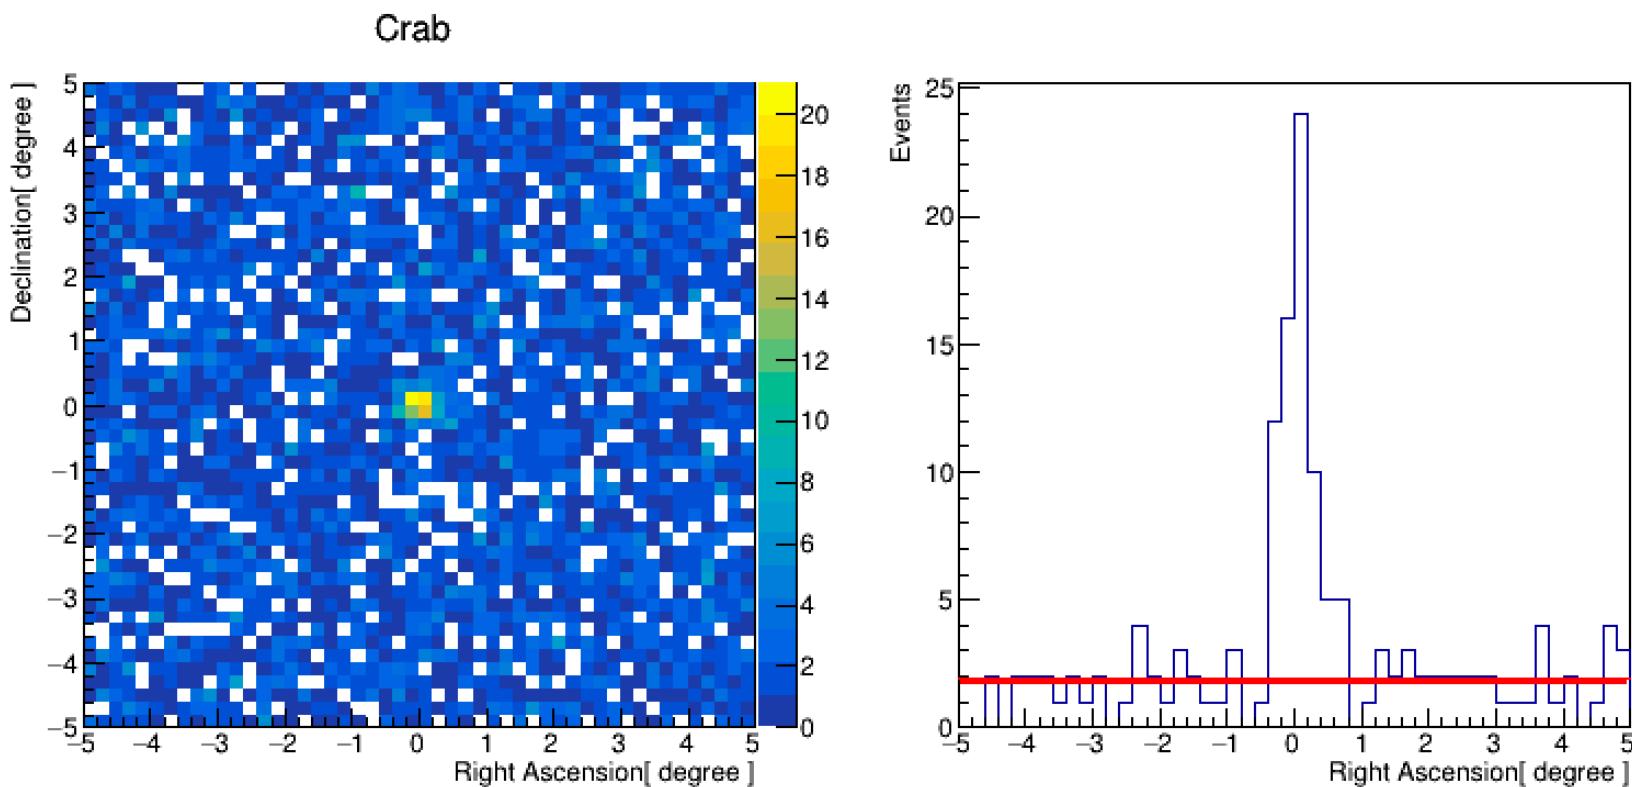

# 200 days Sky map

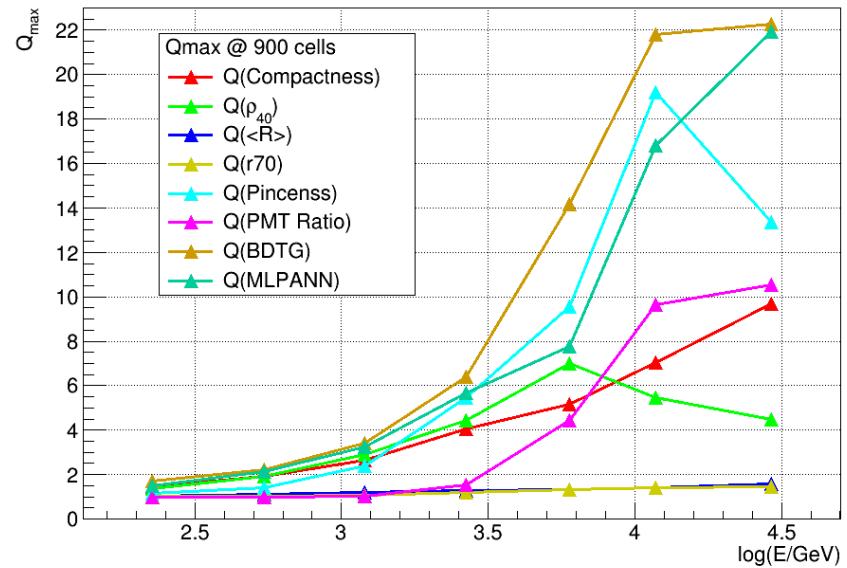

- Data samples
  - Nfit>100;
  - 60 mCU
  - PSF: 0.26
  - 6 hot points with significance  $>7 \sigma$

# Gamma-rich sample from the Crab

- Hard cuts on high energy sample:  $S/N \sim 12$

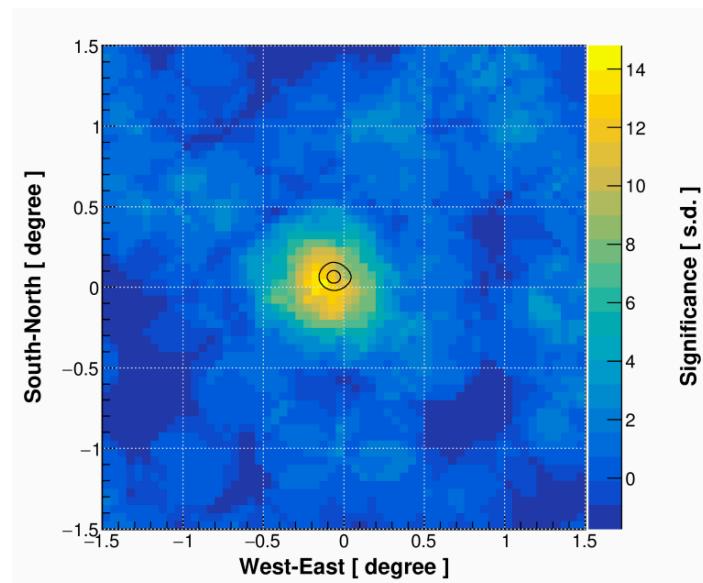

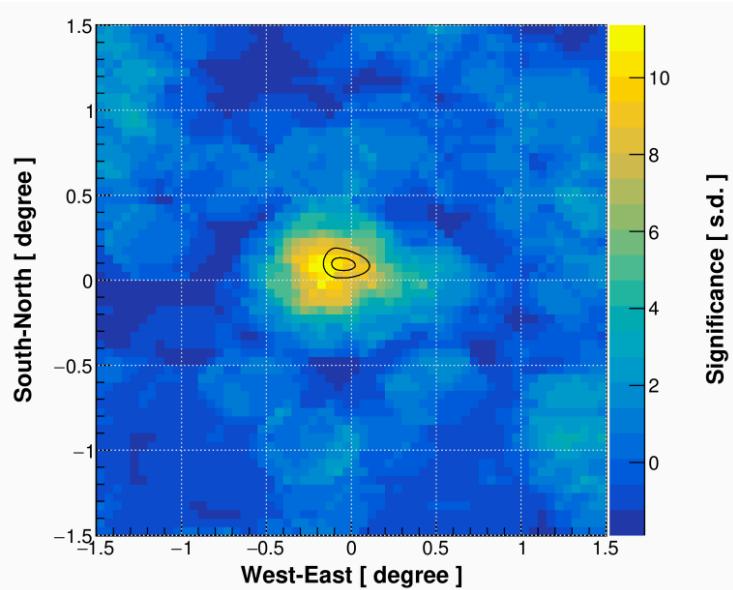

## Compactness cut

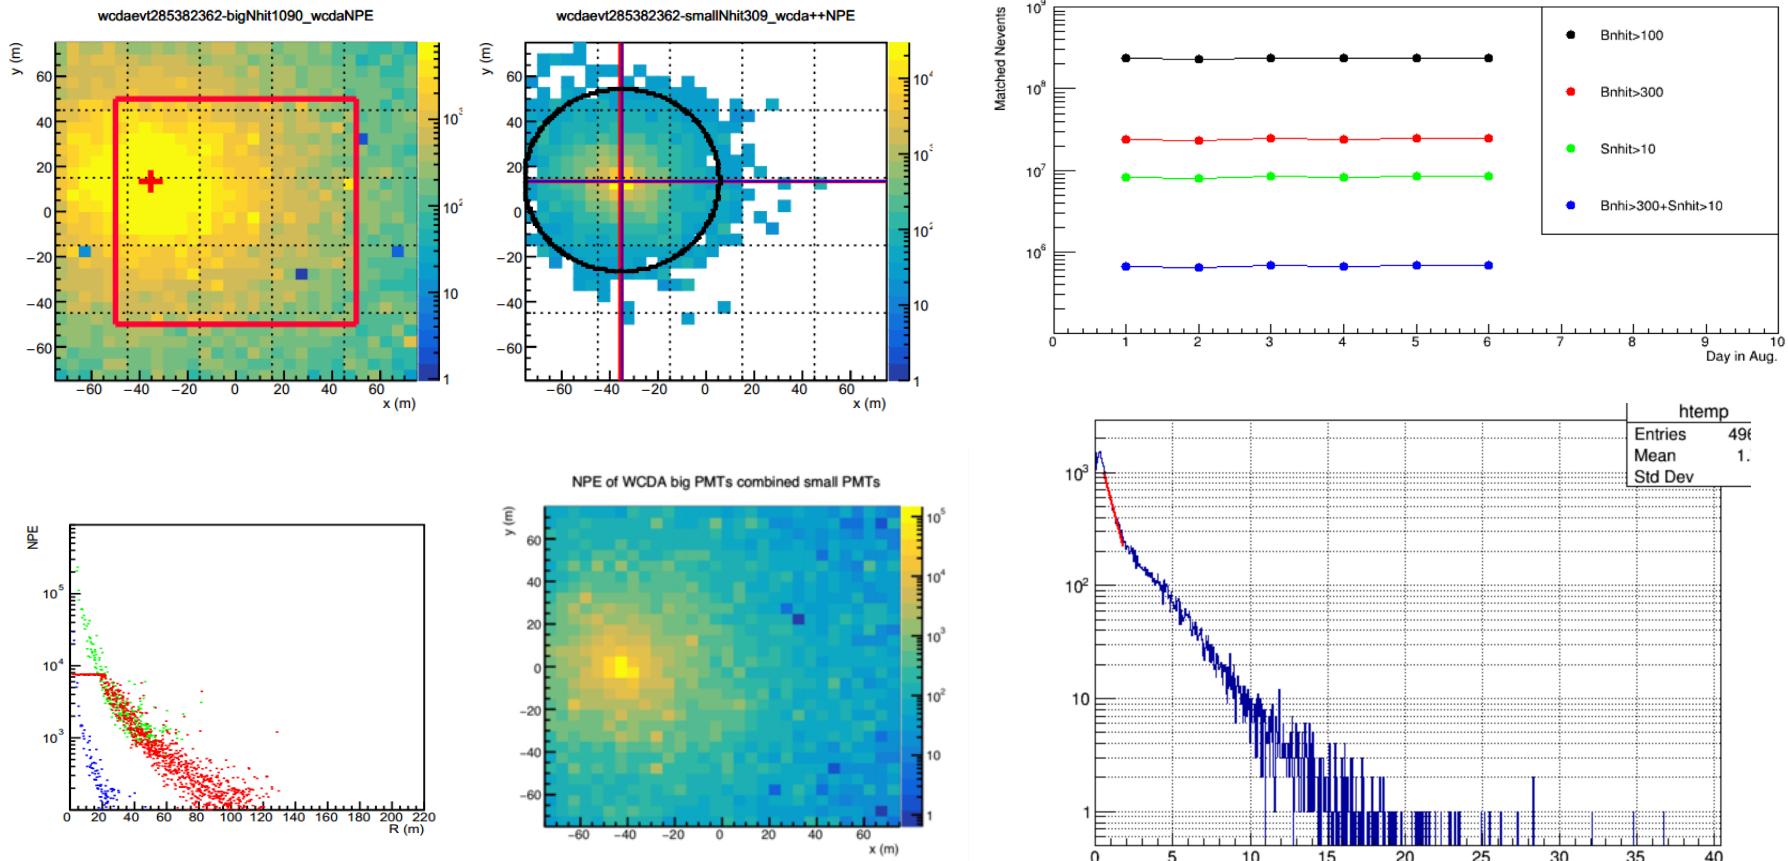

nfitc:300-500

**Improvement: 32%**

**BDTG**

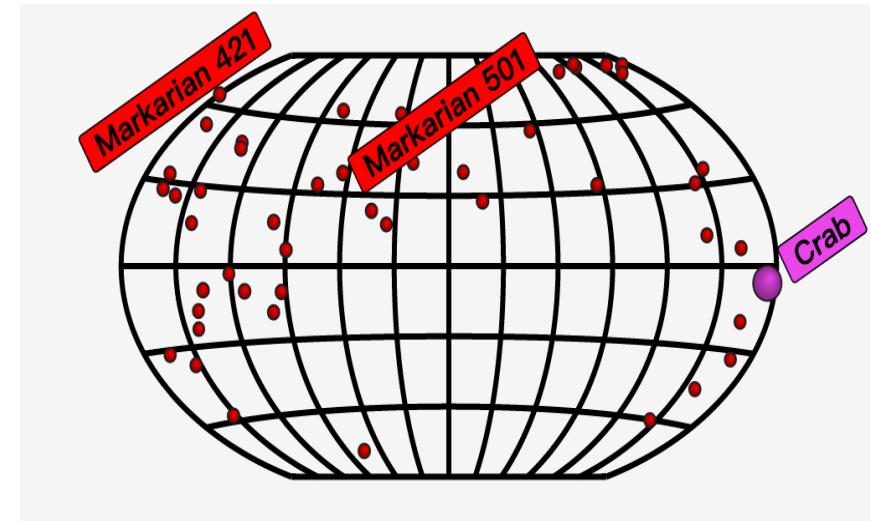

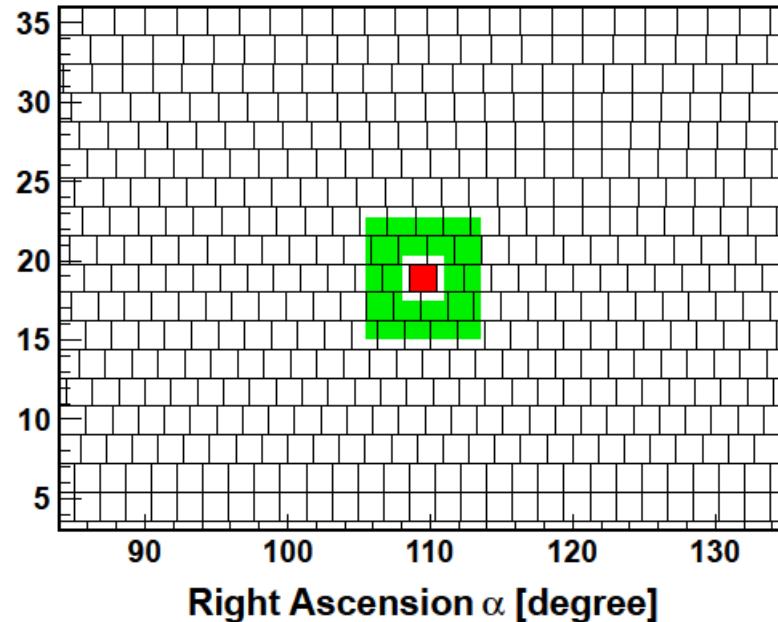

# Joint B-PMT + S-PMT event analysis

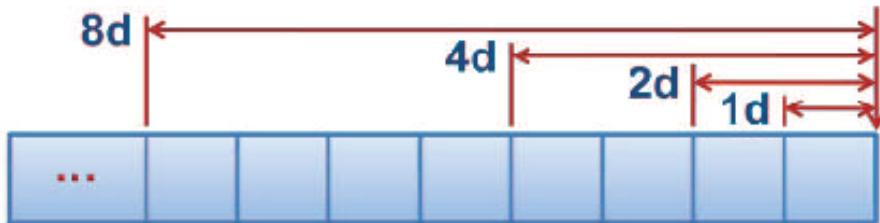

- New G/P separation parameter ?

# "real time" VHE gamma-ray flares

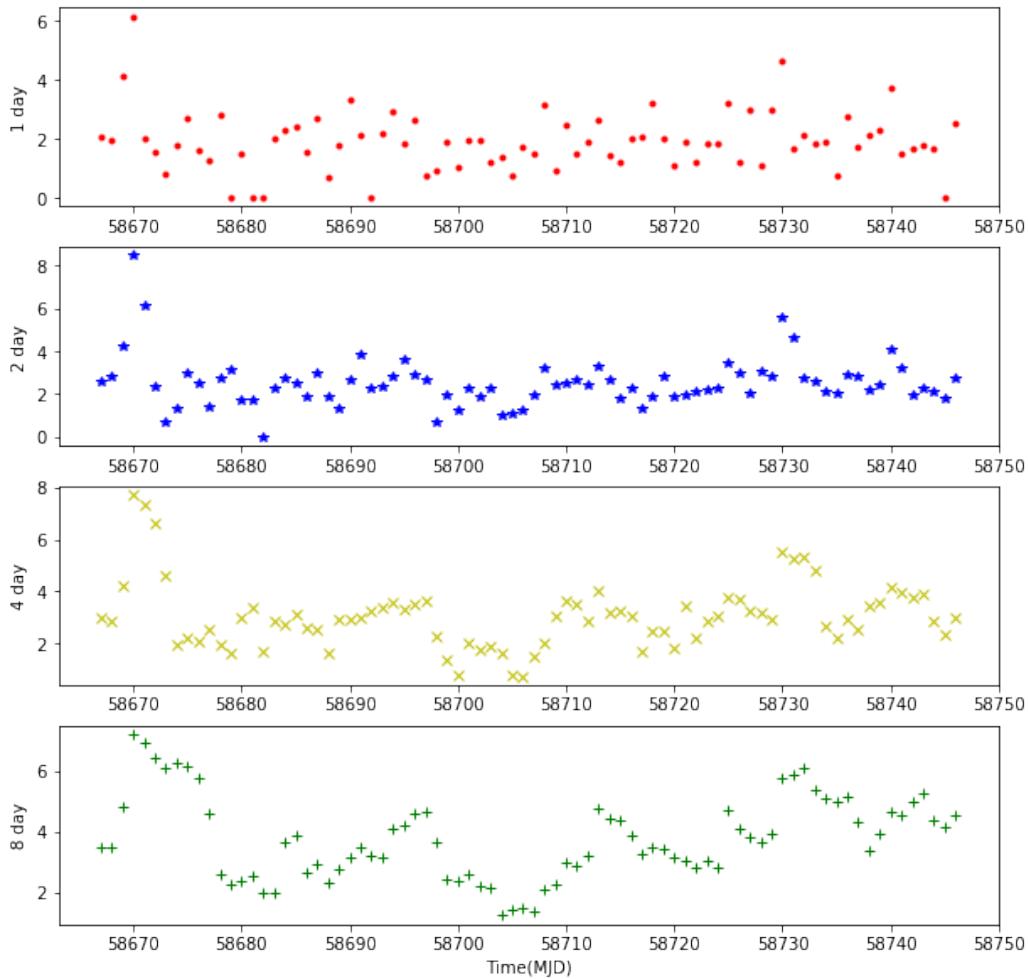

Declination  $\delta$  [degree]

- 62 VHE blazars from TeVCat
- Crab: a direct check for the monitoring scheme

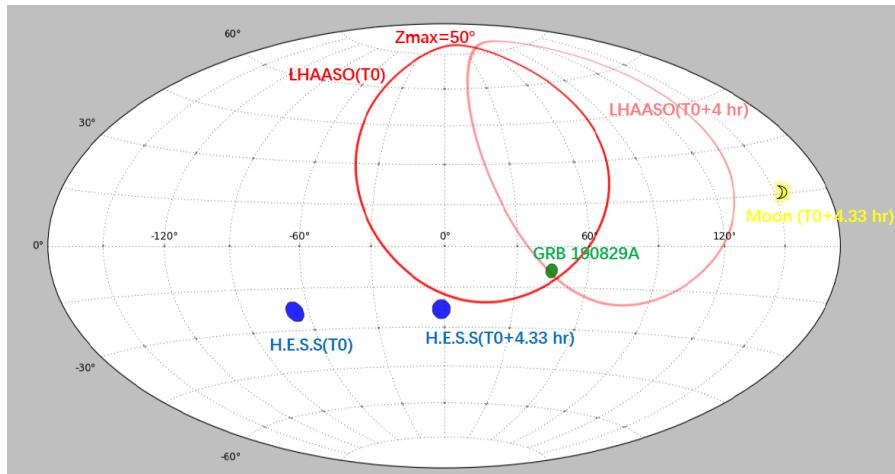

# --continued

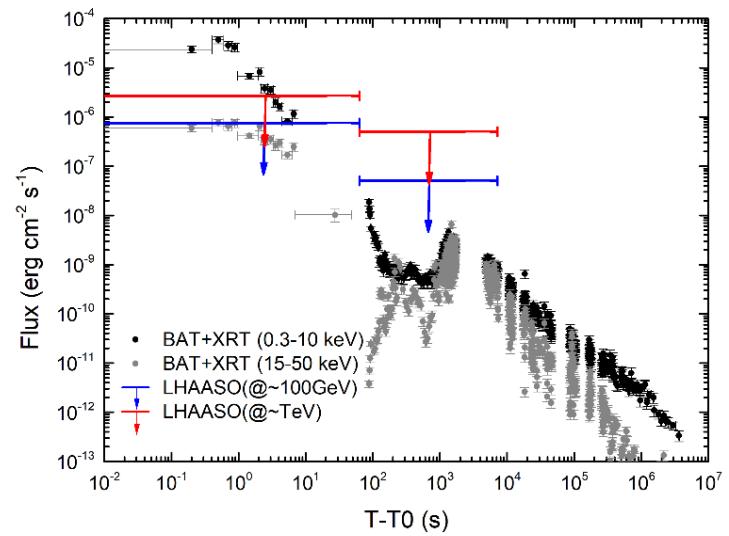

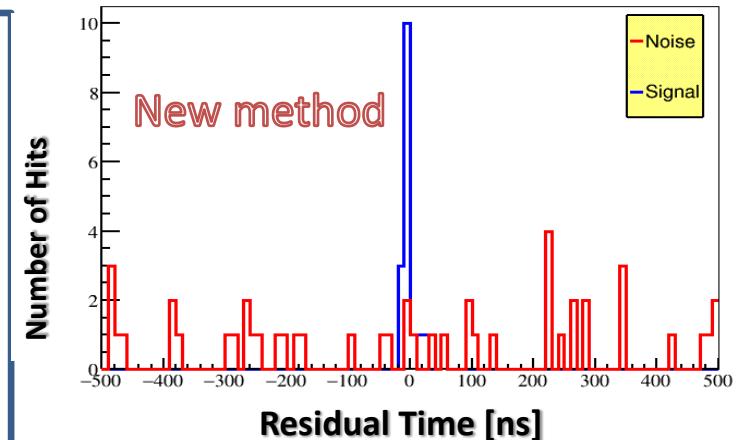

- Preliminary result
- Mrk421 flaring behavior
- Event selection:
  - Without LED signal;
  - $N_{fitc} > 100$
  - $Zenith < 60^\circ$
  - $Compactness > 15$

# GRB follow-up

- Develop a new method to search for GRBs
- Set up GRBs Monitor software
- Carry out analysis of GRB190829A
- 36 GRB follow-ups (Since June 2019)  
the statistical analysis is on the way.

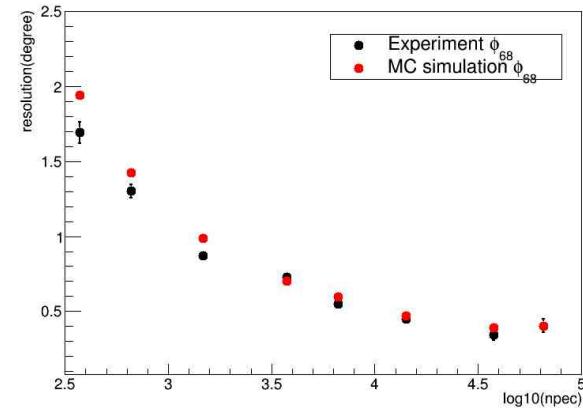

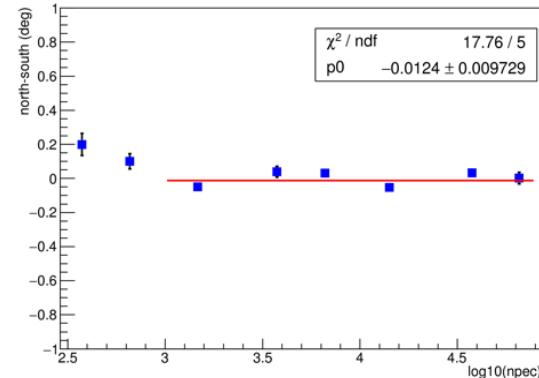

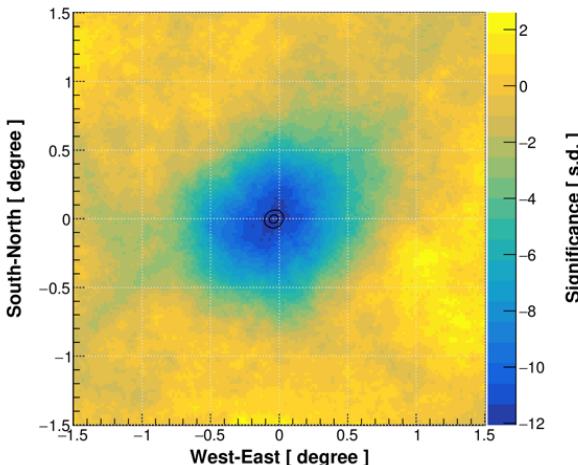

**GRB190829A @ LHAASO-WCDA1**

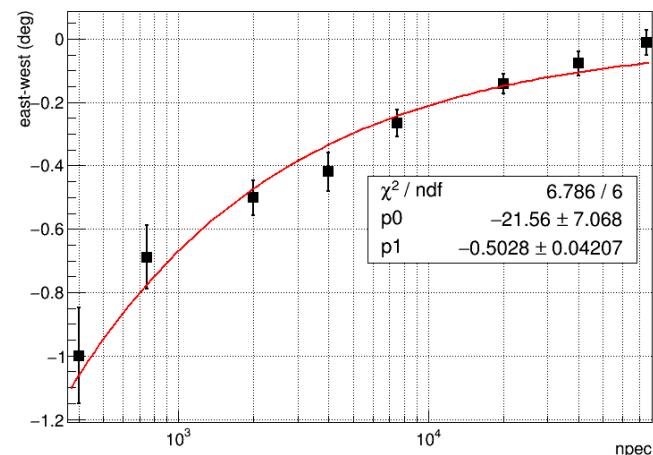

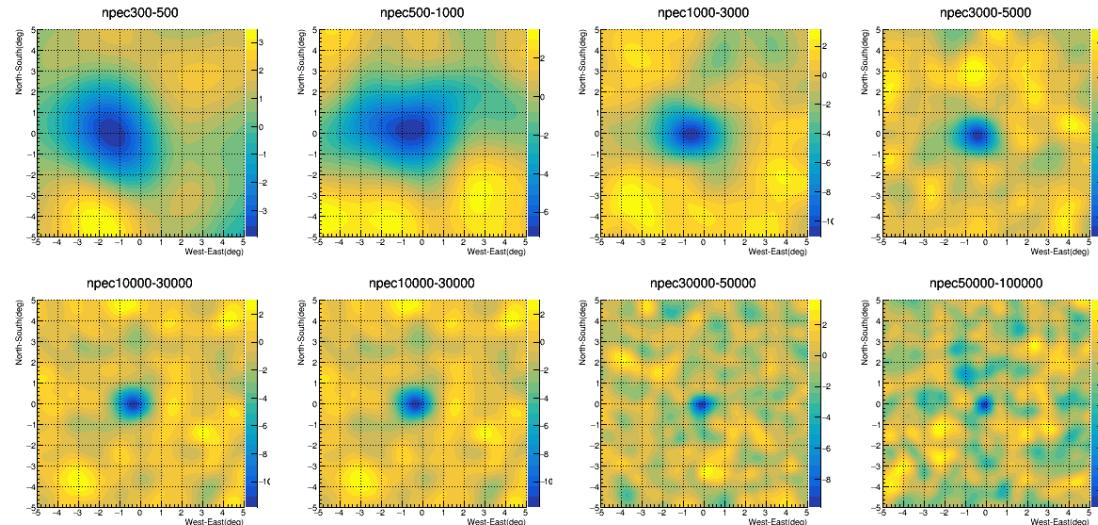

# Moon shadow: Geomagnetic spectrometer

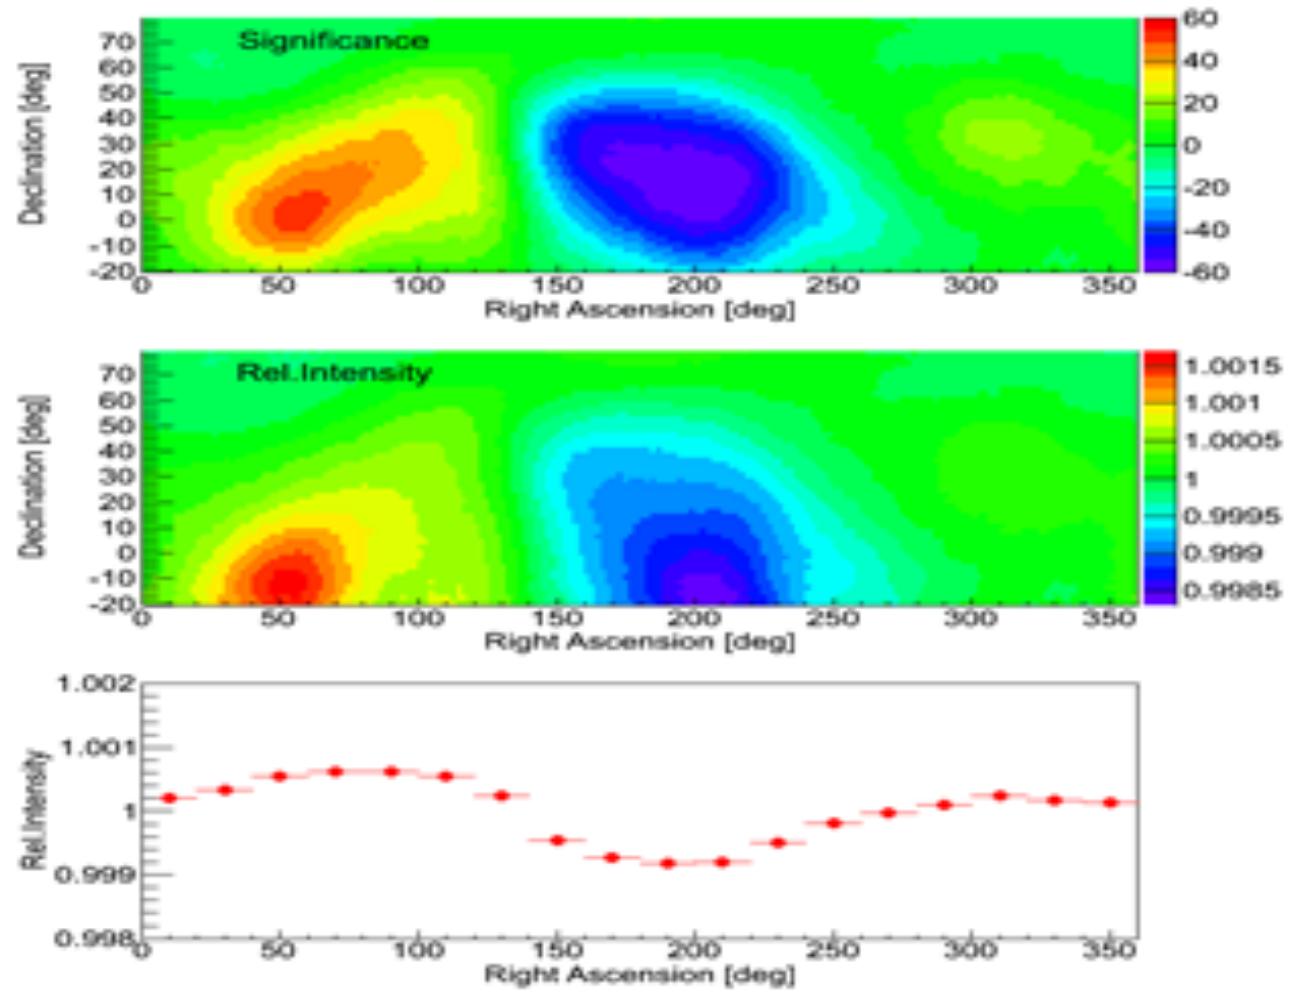

$N_{\text{fit}} > 300$

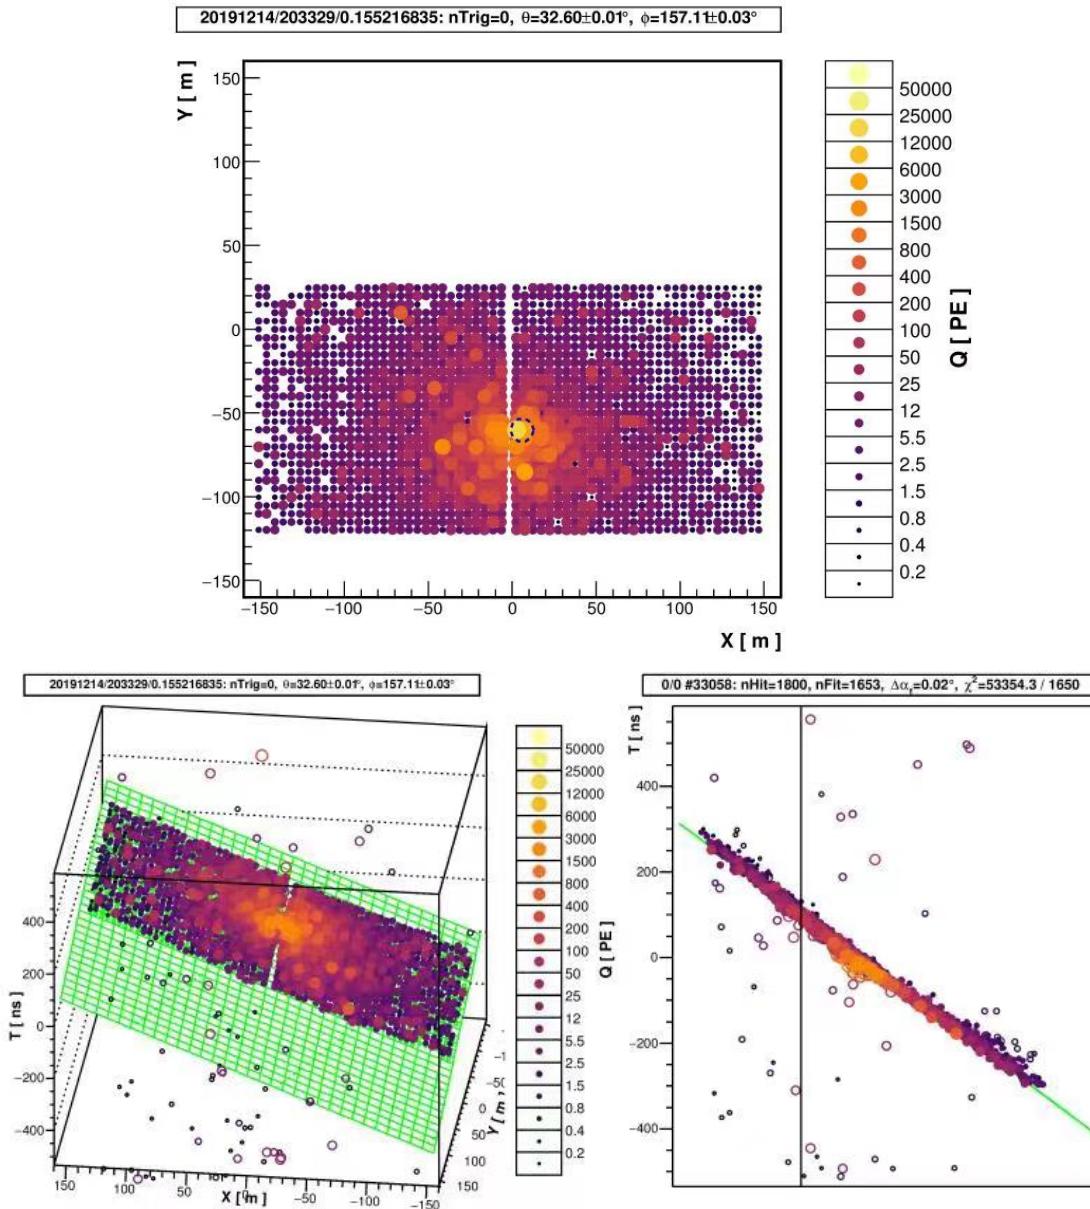

Pointing error  $< 0.05^\circ$

# CR-anisotropy @ 120 days data

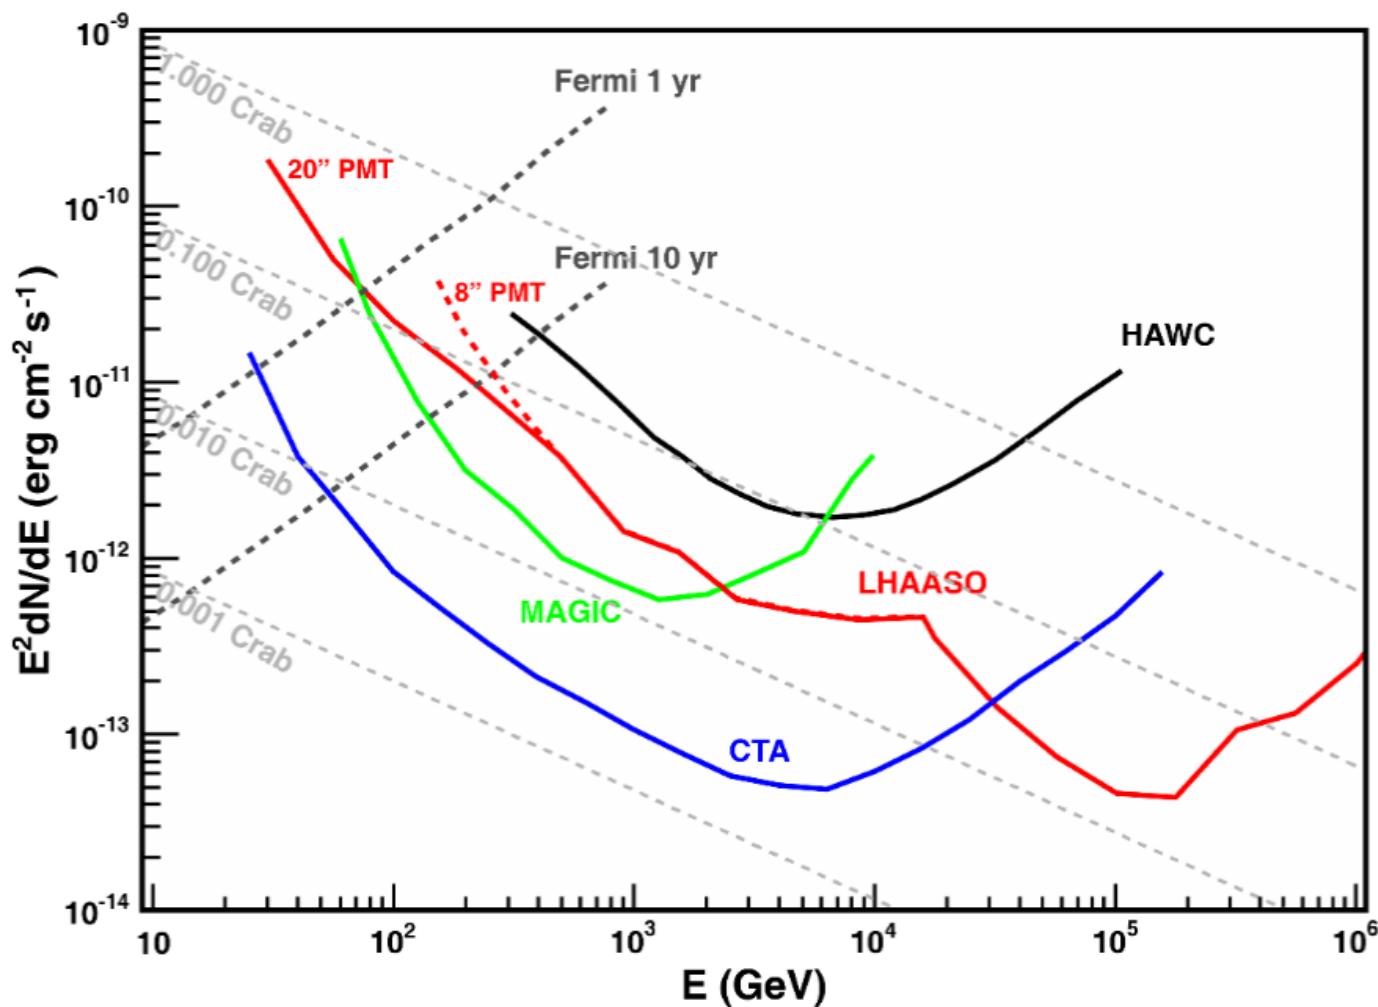

# WCDA-1 + WCDA-2 = a full beautiful event

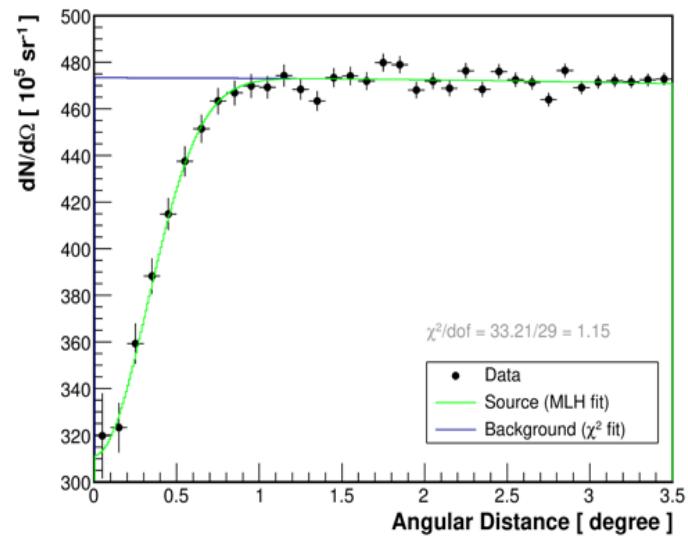

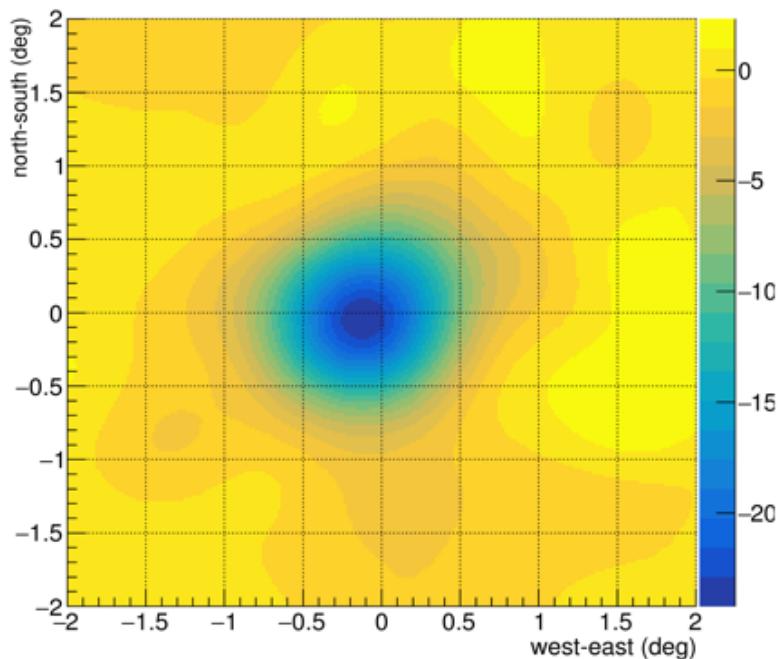

# Summary and outlook

- WCDA-1 works smoothly in scientific operation mode;
  - Crab significance is around 20 sigma per month;
  - Moon shadow significance is around 20 sigma per month;
  - Pointing error is less than 0.1 deg;
  - Sky map, Moon/Sun shadow and CR anisotropy have been observed;
  - To understand the systematic error of the analysis;
- WCDA-2 begin to take physics data in Dec. 24<sup>th</sup> 2019;
  - Looking forward to news from 20-inch PMT
- At the end of 2020, WCDA-3 will be ready.
