Measuring Phase Angle in the Higgs-bottom Yukawa Interaction at Higgs Factory

Hao Zhang

*Theoretical Physics Division, Institute of High Energy Physics,
Chinese Academy of Sciences*

Composite 2019, Nov 22nd, 2019, Guangzhou

Based on work in collaboration with Edmond L. Berger, Qi Bi, Kangyu Chai, Jun Gao and Yiming Liu

Introduction

An Era of Precisely Higgs Physics

- From 2011 to 2019

At the end of 2011, there was no evidence of the new scalar boson. Did you guess the correct mass of the SM-like Higgs boson from the information shown in this figure?

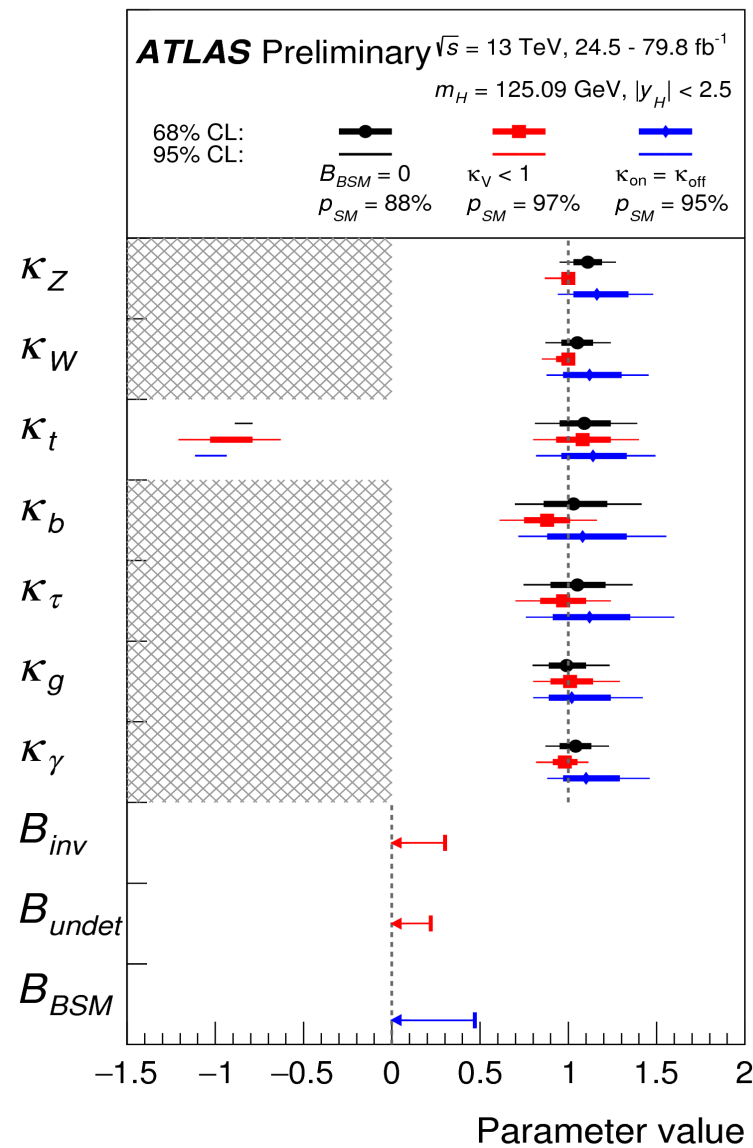

ATLAS and CMS Collaboration,
ATLAS-CONF-2011-157, CMS
PAS HIG-11-023.

An Era of Precisely Higgs Physics

- From 2011 to 2019

With 80 fb⁻¹ integrated luminosity, the κ parameters are measured with ~20% accuracy.

ATLAS Collaboration, arXiv:1909.02845[hep-ex];
 CMS Collaboration, CMS-PAS-HIG-17-031.

An Era of Precisely Higgs Physics

- More information: go beyond the κ -scheme!

ATLAS Collaboration, ATLAS-CONF-2019-032;
 CMS Collaboration, CMS-PAS-HIG-19-001.

An Era of Precisely Higgs Physics

- More precisely result in near future.

ATLAS Collaboration, ATLAS-PHYS-PUB-2018-054;
CMS Collaboration, CMS PAS FTR-18-011.

An Era of Precisely Higgs Physics

- More results with Higgs factory.

An Era of Precisely Higgs Physics

- Go beyond the “signal strength”.

1. Effective Field Theory (theories?) method

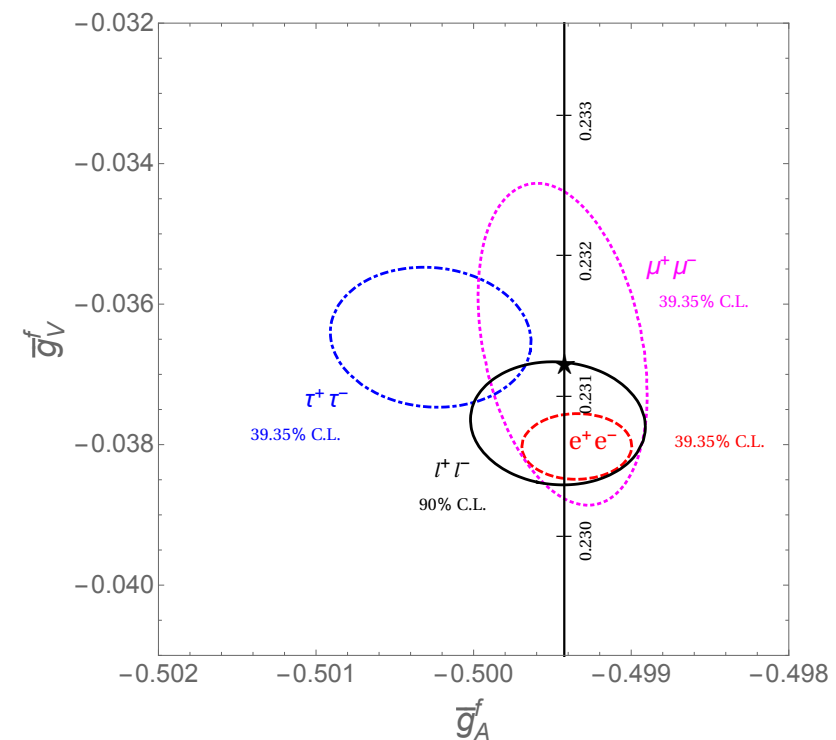

F. An, et al, Chin. Phys. C43 (2019) 043002; etc (too many to be listed fairly)

An Era of Precisely Higgs Physics

- Go beyond the “signal strength”.
1. Effective Field Theory (theories?) method
 - Advantages: model-independent, self-consistent, ...
 - Need helps from traditional method: too many parameters ...

An Era of Precisely Higgs Physics

- Go beyond the “signal strength”.
1. Effective Field Theory (theories?) method
 2. Traditional method: from signal strength to Lorentz structures.

J. Erler and A. Freitas, Phys. Rev. D98 (2018) 030001 (PDG2018)

An Era of Precisely Higgs Physics

- Example: generic form of the SFF interaction

$$\mathcal{L} = y_f h \bar{f} (\cos \alpha_f + i \gamma_5 \sin \alpha_f) f$$

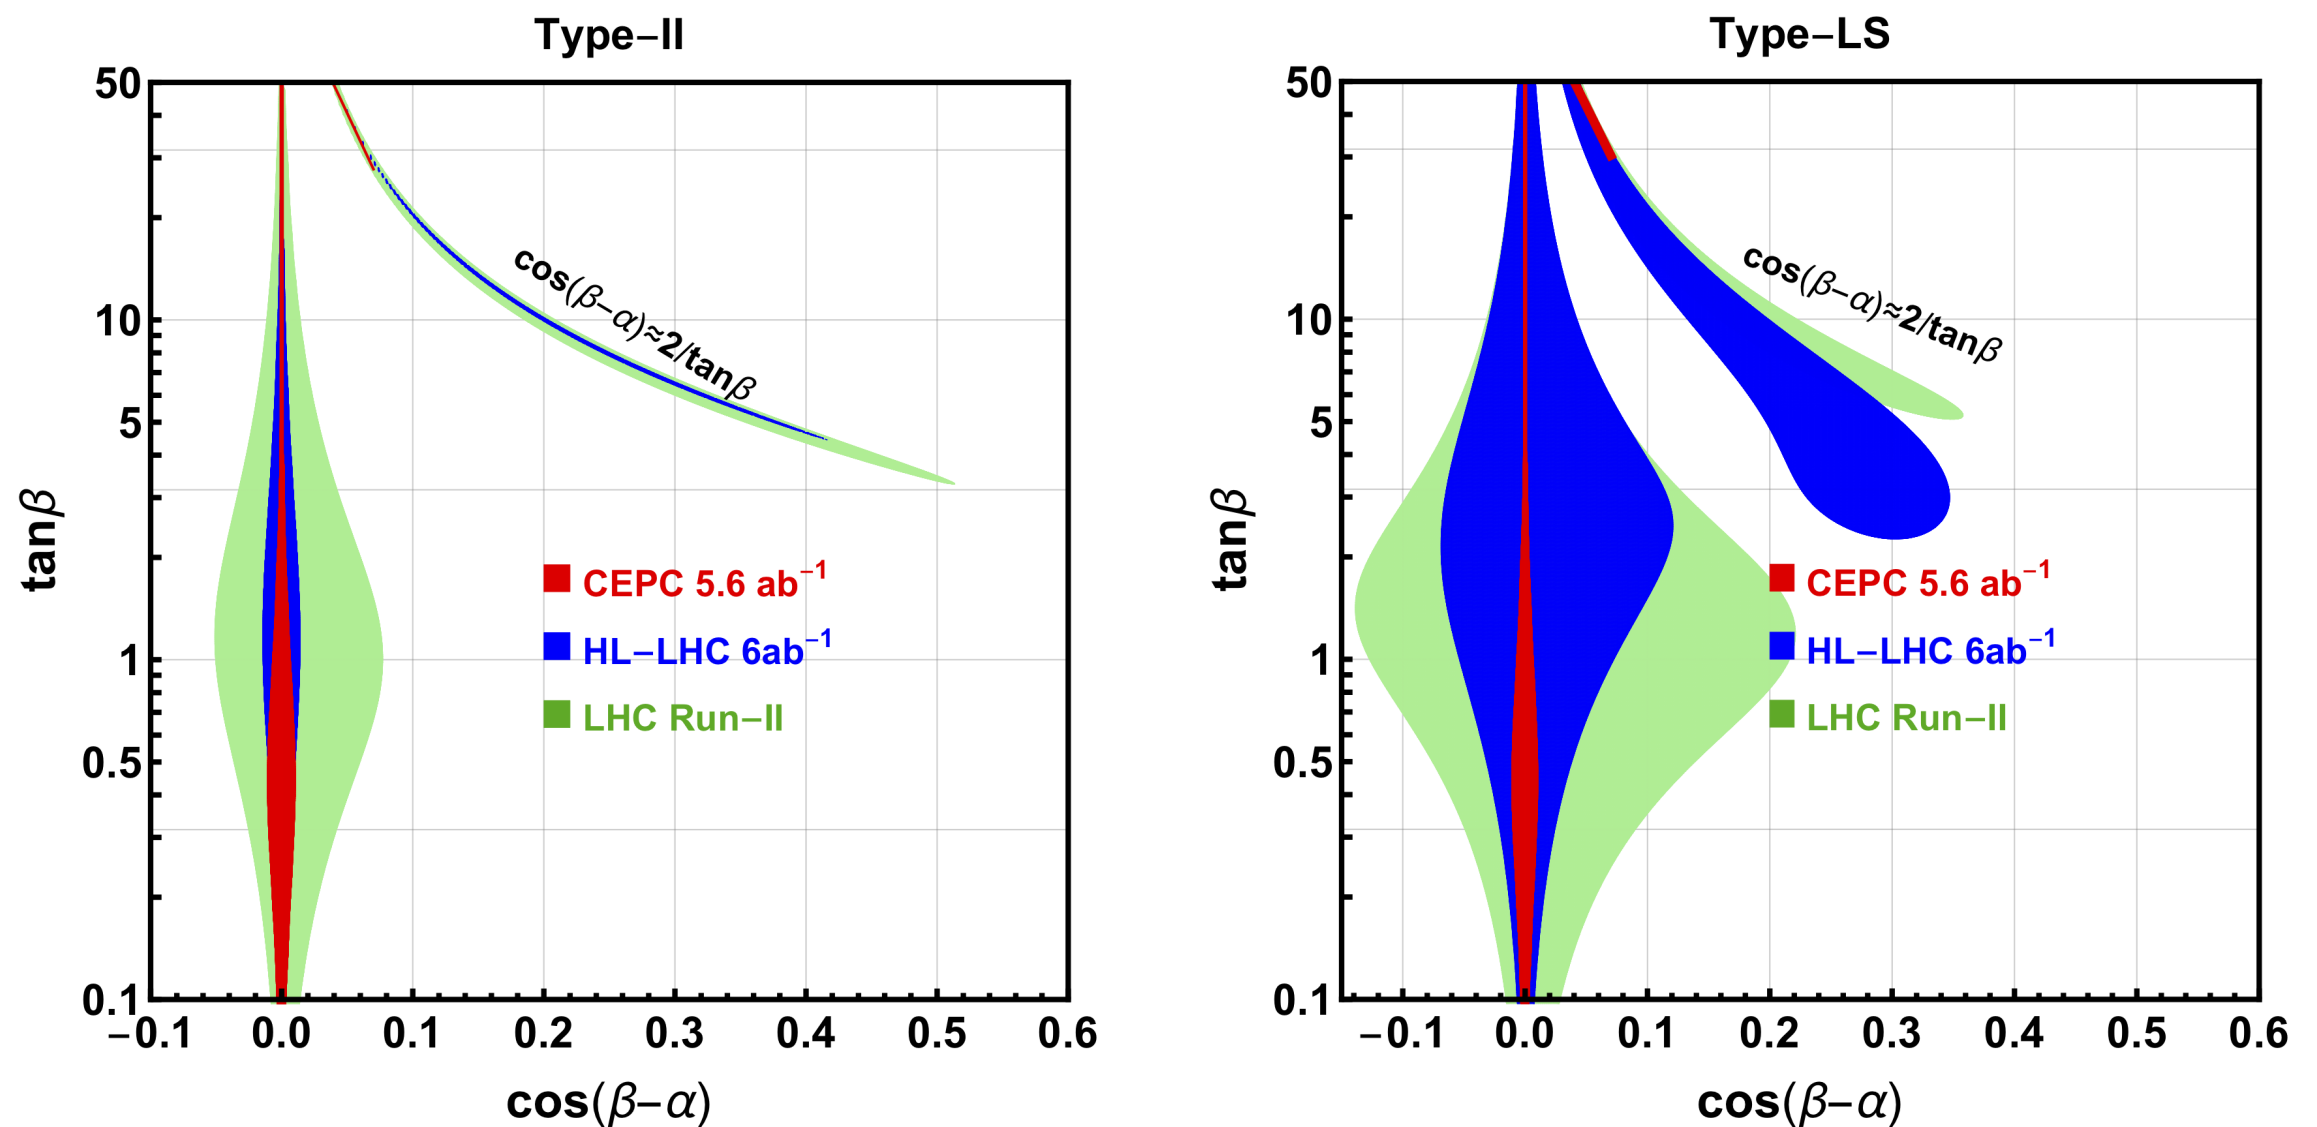

$$y_f \in \mathbb{R}^+, \quad \alpha_f \in (-\pi, \pi]$$

- The non-zero phases in the Yukawa interactions are evidence of new sources of EWSB and might be important for us to understand the matter-antimatter asymmetry in our universe.
- Can we measure the α_f ?

Phase in bottom-quark Yukawa interaction

Phase in bottom-quark Yukawa Interactions

- Very interesting parameter.
- Exp: 2HDMs

Wei Su, arXiv:1910.06269[hep-ph].

Phase in bottom-quark Yukawa Interactions

- Indirect measurement (e.g. EDM).

$$\mathcal{L}_{\text{eff}} = -d_q \frac{i}{2} \bar{q} \sigma^{\mu\nu} \gamma_5 q F_{\mu\nu} - \tilde{d}_q \frac{i g_s}{2} \bar{q} \sigma^{\mu\nu} T^a \gamma_5 q G_{\mu\nu}^a$$

$$d_q \simeq -12eQ_q Q_b^2 \frac{\alpha}{(4\pi)^3} \sqrt{2} G_F m_q \kappa_b \sin \phi_b x_b \left(\log^2 x_b + \frac{\pi^2}{3} \right),$$

$$\tilde{d}_q \simeq 2 \frac{\alpha_s}{(4\pi)^3} \sqrt{2} G_F m_q \kappa_b \sin \phi_b x_b \left(\log^2 x_b + \frac{\pi^2}{3} \right),$$

J. Brod and E. Stamou, arXiv:1810.12303[hep-ph].

Phase in bottom-quark Yukawa Interactions

- Indirect measurement (e.g. EDM).
- Hadronic EDMs (90% C.L.):

$$\frac{y_b}{y_b^{\text{SM}}} |\sin \alpha_b| < 5$$

- Electron EDM (90% C.L.):

$$\frac{y_b}{y_b^{\text{SM}}} |\sin \alpha_b| < 0.4$$

Phase in bottom-quark Yukawa Interactions

- Indirect measurement (e.g. EDM).
- Hadronic EDMs (90% C.L.):

$$\frac{y_b}{y_b^{\text{SM}}} |\sin \alpha_b| < 5$$

- Electron EDM (90% C.L.):

$$\frac{y_b}{y_b^{\text{SM}}} |\sin \alpha_b| < 0.4$$

- But indirectly measurements are suffered by the NP contributions to the loop...

J. Brod and E. Stamou, [arXiv:1810.12303\[hep-ph\]](https://arxiv.org/abs/1810.12303).

Phase in bottom-quark Yukawa Interactions

- Indirect measurement (e.g. EDM).
- But difficult at the LHC!
- Indirect: small contribution to gluon fusion process due to tiny coupling constant.

$$\sigma(gg \rightarrow H) \sim 1.04\kappa_t^2 + 0.002\kappa_b^2 - 0.04\kappa_t\kappa_b$$

Phase in bottom-quark Yukawa Interactions

- Very difficult at the LHC!
- Direct: large background, large contribution from Hgg.

N. Deutschmann, F. Maltoni, M. Wiesemann and Marco Zaro, JHEP 1907 (2019) 054.

Phase in bottom-quark Yukawa Interactions

- But possible at Higgs factory.

$$\Gamma(h \rightarrow b\bar{b}) = \Gamma(h \rightarrow b\bar{b})^{\text{SM}} \left(\frac{y_b^{\text{SM}}}{y_b} \right)^2 (\cos^2 \alpha_b + \beta_b^{-2} \sin^2 \alpha_b)$$

- Small bottom mass, 0.25% modulation of the partial width.
- Sensitivity of the partial width: ~0.3%.
- We need other method.

Phase in bottom-quark Yukawa Interactions

- Interference in Higgs decay:

- Advantage: the Hgg interaction can be well measured at both the LHC and the Higgs factory, with the information of the Lorentz structure.

$$hG_{\mu\nu}^a G^{a,\mu\nu} \quad \mathbf{vs} \quad hG_{\mu\nu}^a \tilde{G}^{a,\mu\nu}$$

Phase in bottom-quark Yukawa Interactions

- Interference in Higgs decay:

$$d\Gamma \sim y_b^2 \alpha_s d\Gamma_{11} + y_b \alpha_s^2 \left(\frac{m_b}{m_h} \right) d\Gamma_{12} + \alpha_s^3 d\Gamma_{22}$$

- Chirality analysis.

- Symmetry

$$\psi_f \rightarrow e^{-i\alpha_f \gamma_5 / 2} \psi_f$$

$$\begin{aligned} \bar{\psi}_f e^{i\alpha_f \gamma_5} \psi_f &\rightarrow \psi_f^\dagger e^{i\alpha_f \gamma_5 / 2} \gamma^0 e^{i\alpha_f \gamma_5} e^{-i\alpha_f \gamma_5 / 2} \psi_f \\ &= \psi_f^\dagger \gamma^0 e^{-i\alpha_f \gamma_5 / 2} e^{i\alpha_f \gamma_5} e^{-i\alpha_f \gamma_5 / 2} \psi_f = \bar{\psi}_f \psi_f \end{aligned}$$

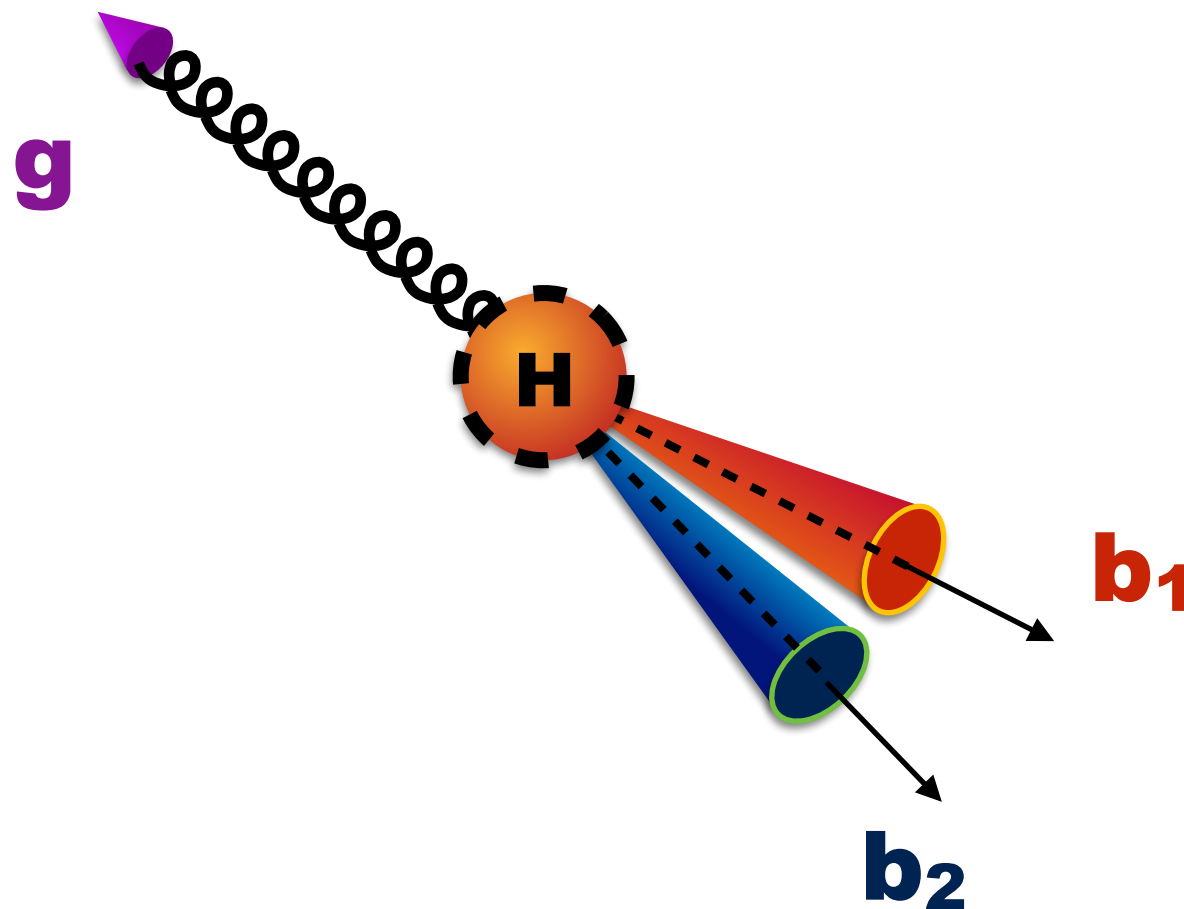

$$m_f \bar{\psi}_f \psi_f \rightarrow m_f \psi_f^\dagger e^{i\alpha_f \gamma_5 / 2} \gamma^0 e^{-i\alpha_f \gamma_5 / 2} \psi_f = m_f \bar{\psi}_f e^{-i\alpha_f \gamma_5} \psi_f$$

Phase in bottom-quark Yukawa Interactions

- Interference in Higgs decay:

$$d\Gamma \sim y_b^2 \alpha_s d\Gamma_{11} + y_b \alpha_s^2 \left(\frac{m_b}{m_h} \right) d\Gamma_{12} + \alpha_s^3 d\Gamma_{22}$$

- To enhance the interference effect:

$$\zeta_H \equiv \frac{2E_{b_1} E_{b_2}}{\sqrt{E_{b_1}^2 + E_{b_2}^2}} \cos \theta_{b_1 b_2},$$

Collider Simulation

- We analyze the signal and backgrounds at 240GeV Higgs factory and 365GeV electron-positron collider.
- Results from different decay modes of the Z-boson are combined.
- Both signal and background events are produced with MadGraph5. ISR effect and NNLO k-factor are included.
- The detector effect is simulated with Gaussian smearing effect.

F. An, et al, *Chin. Phys. C*43 (2019) 043002; C. Chen, Z. Cui, G. Li, Q. Li, M. Ruan, L. Wang, Q.-s. Yan, [arXiv:1705.04486\[hep-ph\]](https://arxiv.org/abs/1705.04486); Q.-F. Sun, F. Feng, Y. Jia, W.-L. Sang, *Phys. Rev. D*96 (2017) 051301; Y. Gong, Z. Li, X. Xu, L. L. Yang, X. Zhao, *Phys. Rev. D*95 (2017) 093003

Collider Simulation

- The detector effect is simulated with Gaussian smearing effect.

$$\begin{aligned}\frac{\sigma(E_j)}{E_j} &= \frac{0.60}{\sqrt{E_j/\text{GeV}}} \oplus 0.01, \\ \frac{\sigma(E_{e^\pm, \gamma})}{E_{e^\pm, \gamma}} &= \frac{0.16}{\sqrt{E_{e^\pm, \gamma}/\text{GeV}}} \oplus 0.01, \\ \sigma\left(\frac{1}{p_{T, \mu^\pm}}\right) &= 2 \times 10^{-5} \text{ GeV}^{-1} \oplus \frac{0.001}{p_{\mu^\pm} \sin^{3/2} \theta_{\mu^\pm}},\end{aligned}$$

- The b-tagging efficiency is set to be 80% for channels with leptonic decaying Z boson, and 60% for channels with hadronic decaying Z boson.
- Charm quark jet mis-tagging rate is set to be 10%, light jets mis-tagging rates is set to be 1%.

Collider Simulation

- Pre-selection cuts

$$|\eta_{j,\ell^\pm}| < 2.3, \quad \Delta R_{ij} > 0.1, \Delta R_{il} > 0.2, \\ E_j > 10\text{GeV}, \quad E_{\ell^\pm} > 5\text{GeV}.$$

- 240GeV leptonic decaying Z

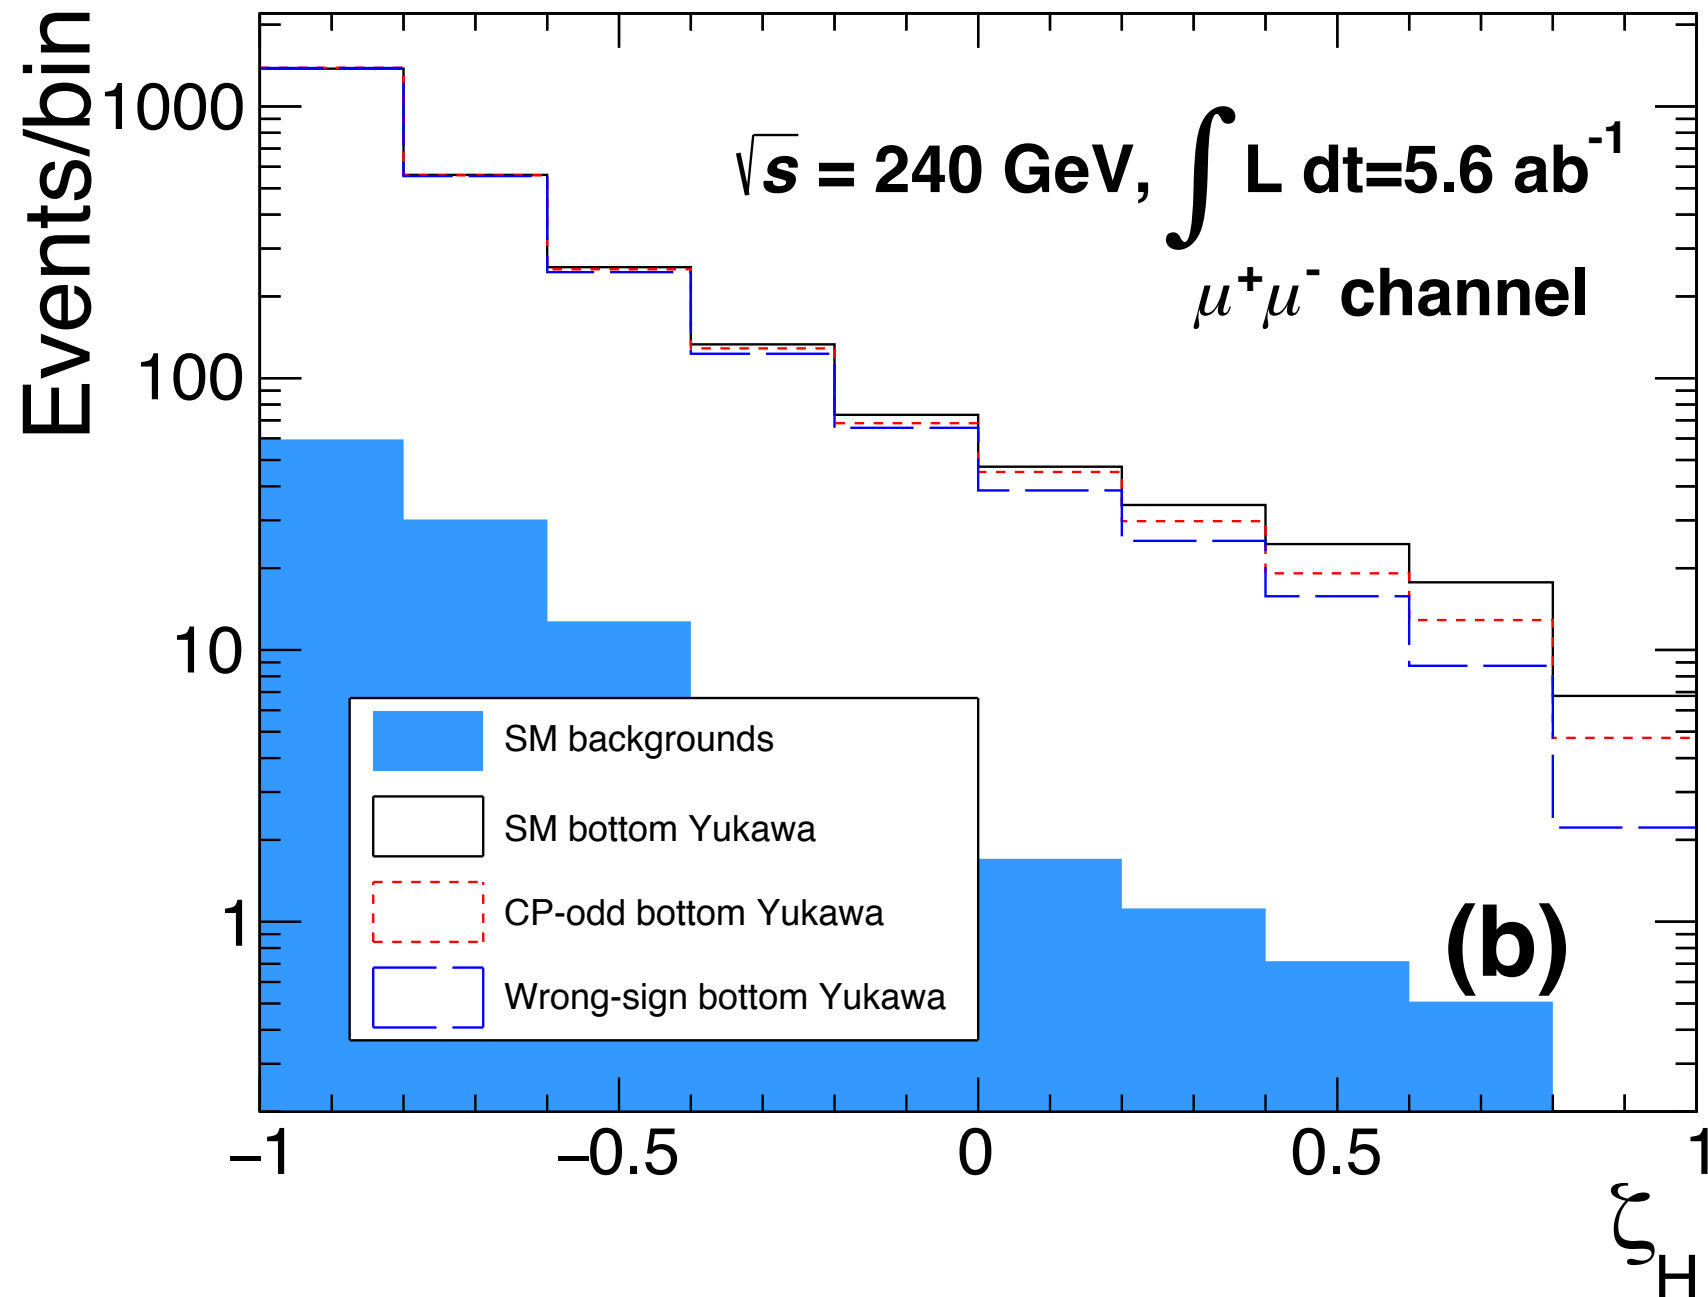

$$|m_{\mu^+\mu^-} - m_Z| < 10\text{GeV}, \quad |m_{e^+e^-} - m_Z| < 15\text{GeV}, \\ \theta_{\ell^+\ell^-} > 80^\circ, \quad \cancel{E}_T < 10\text{GeV}, \\ 124.5\text{GeV} < m_{\text{recoil}} < 130\text{GeV}, \text{ for } \mu^+\mu^- \text{ channel}, \\ 118 \text{ GeV} < m_{\text{recoil}} < 140\text{GeV}, \text{ for } e^+e^- \text{ channel},$$

- 240GeV hadronic decaying Z

$$|\cos \theta_i| < 0.98, \quad d_{ij} > 0.002, E_j > 15\text{GeV}, \cancel{E}_T < 10\text{GeV}.$$

Collider Simulation

- Interference in Higgs decay:

Collider Simulation

- Hadronic decaying Z: likelihood method.

$$L_Z(m) = P(m; 91.0\text{GeV}, 6.19\text{GeV}),$$

$$L_h(m) = P(m; 125.3\text{GeV}, 6.54\text{GeV}),$$

$$L_{rZ}(m) = P(m; 126.7\text{GeV}, 8.43\text{GeV}),$$

$$L_{rh}(m) = P(m; 93.0\text{GeV}, 10.56\text{GeV}),$$

- We reconstruct Z and H with minimizing the discriminator

$$\begin{aligned} \Delta = & -2\ln L_Z(m_{i_1 i_2}) - 2\ln L_h(m_{i_3 i_4 i_5}) - 2\ln L_{rZ}(m_{i_1 i_2}^{\text{recoil}}) \\ & - 2\ln L_{rh}(m_{i_3 i_4 i_5}^{\text{recoil}}) - 70B(i_3) - 70B(i_4) \\ & + 100B(i_5), \end{aligned} \tag{24}$$

Collider Simulation

- Interference in Higgs decay:

Results

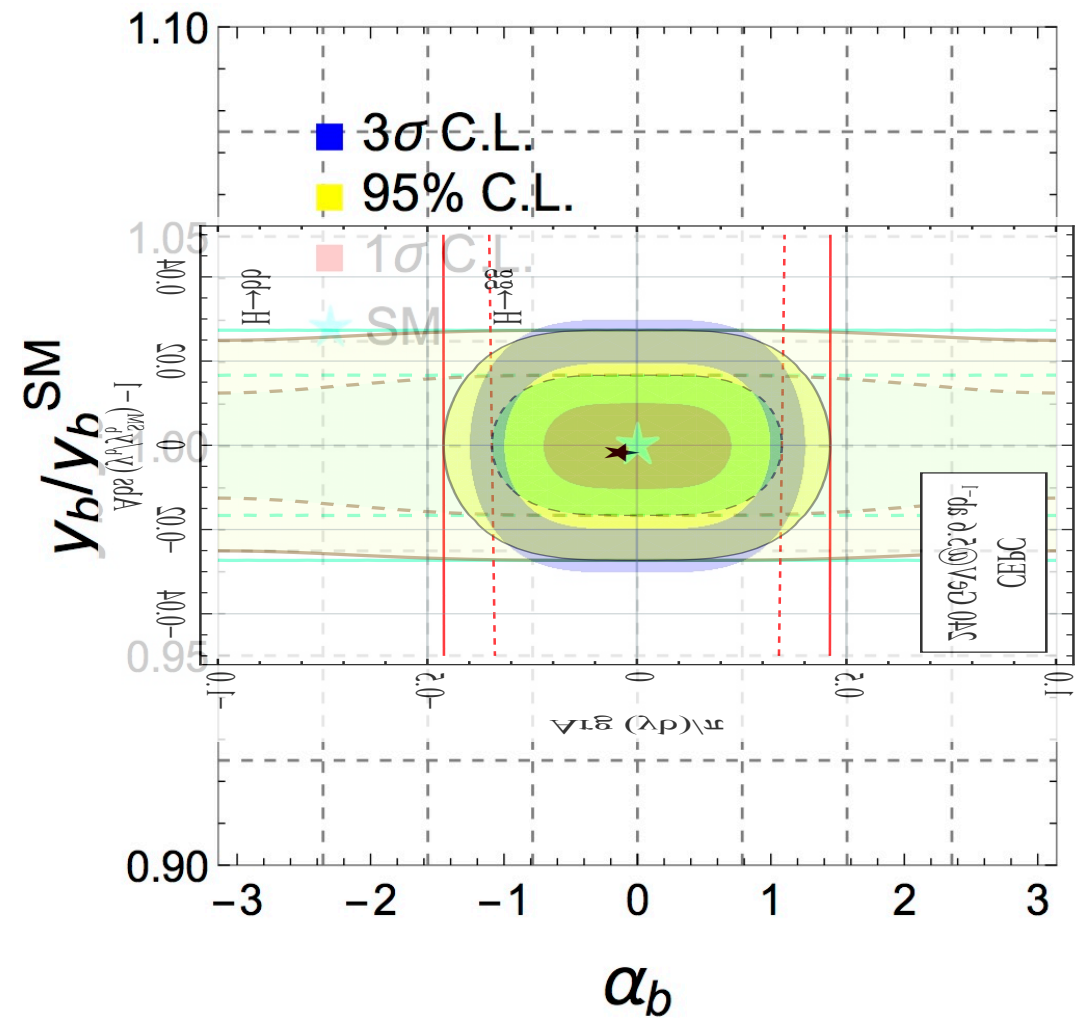

- 240GeV Higgs factory with 5.6ab^{-1} integrated luminosity.

$\delta\alpha_b \sim 40^\circ$

Results

- 240GeV Higgs factory with 5.6ab^{-1} integrated luminosity.

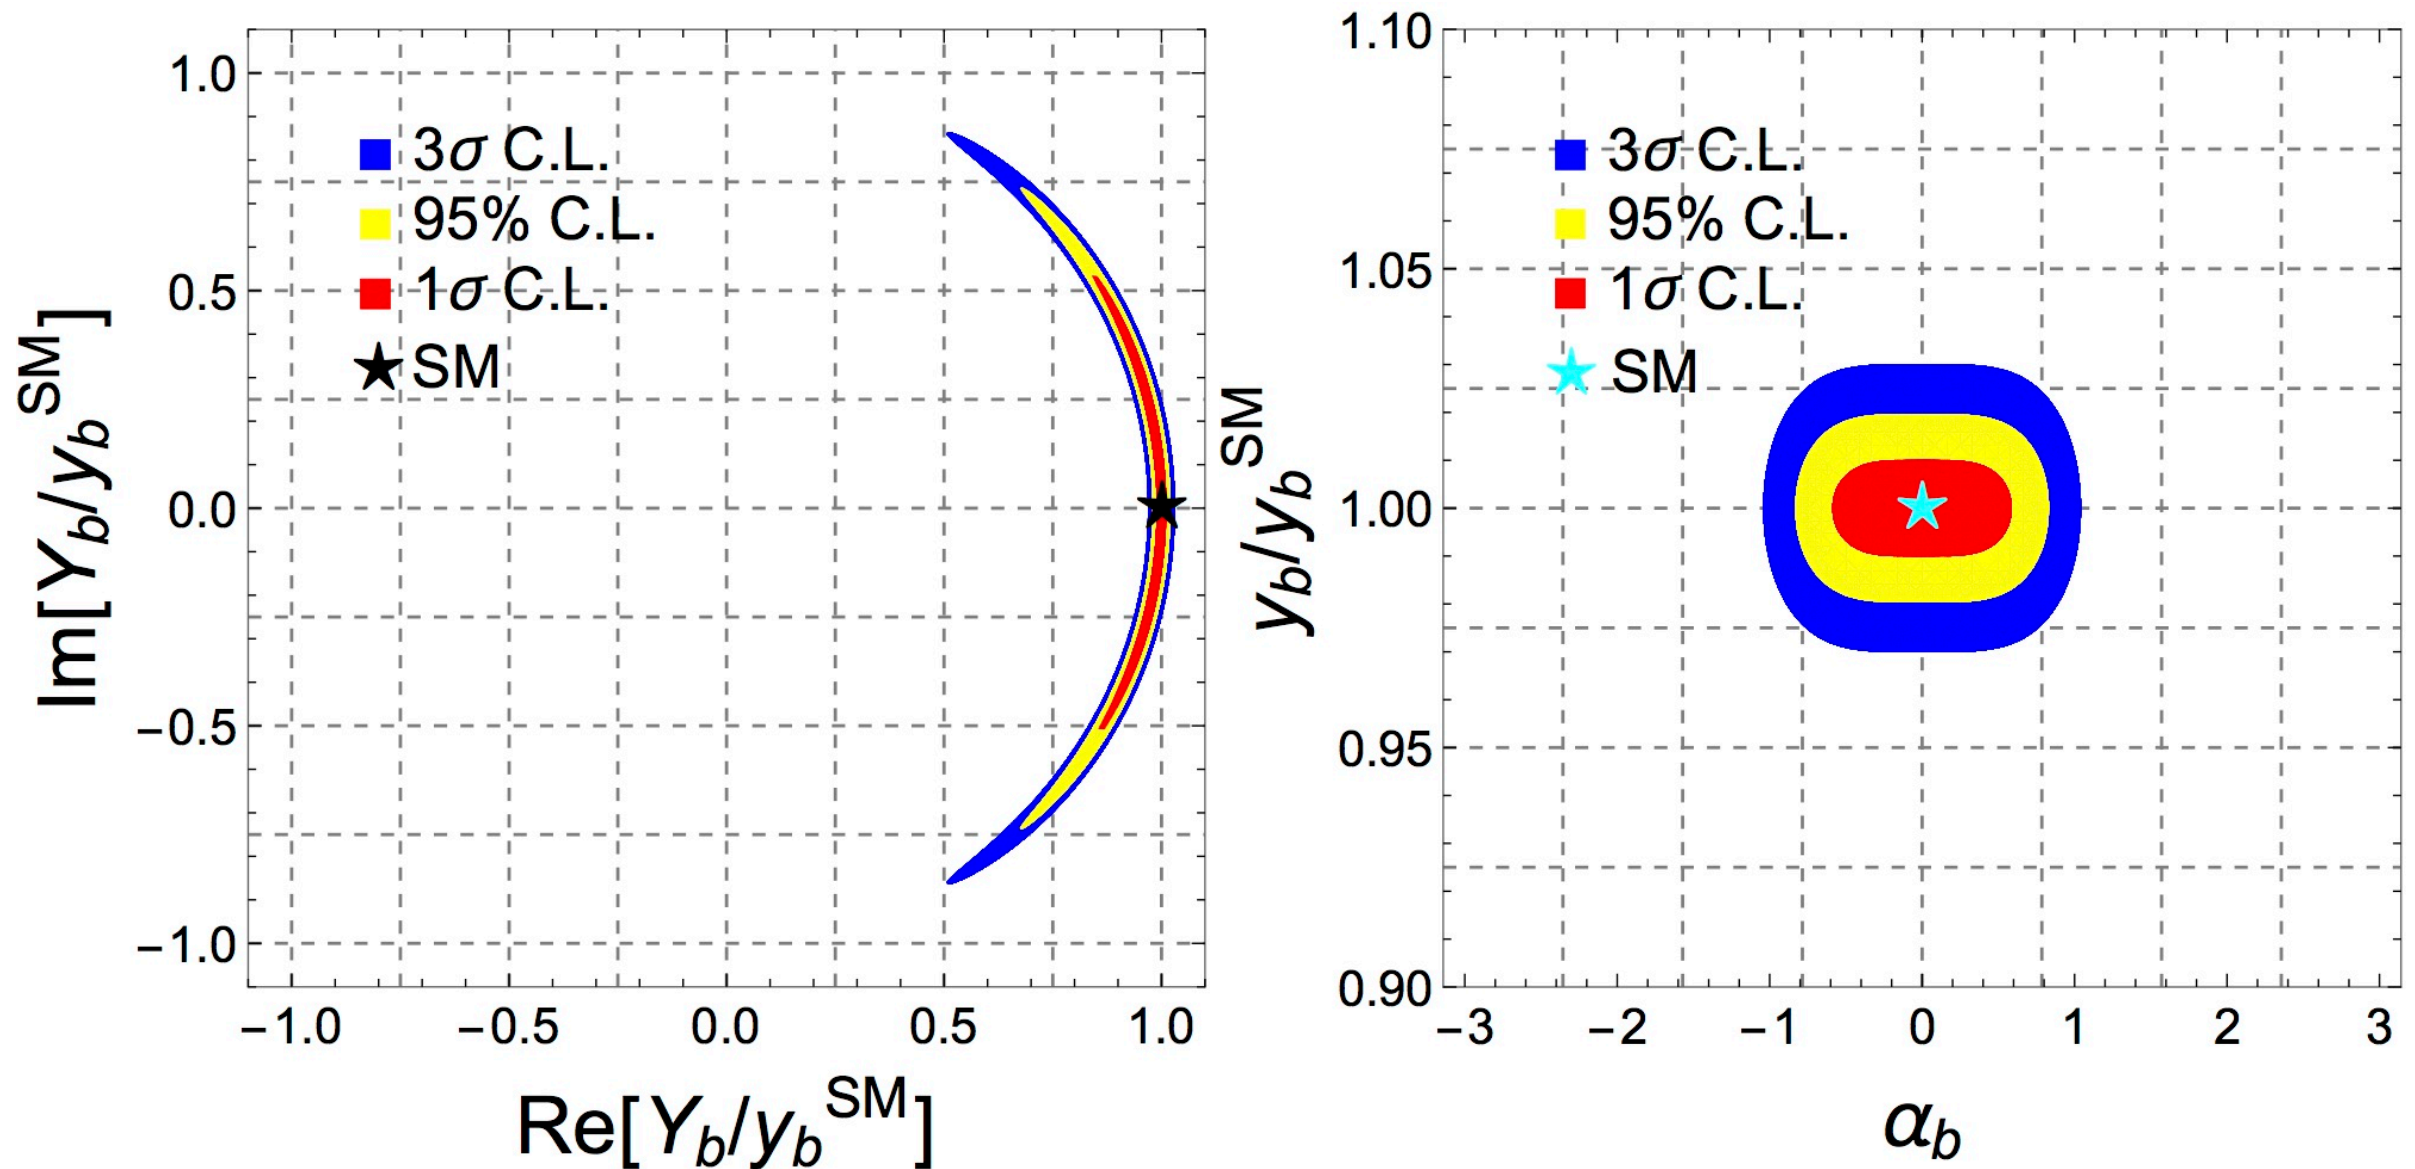

$\delta\alpha_b \sim 40^\circ$

F. An, et al, Chin. Phys. C43 (2019) 043002;

Results

- 240GeV Higgs factory with 5.6ab^{-1} integrated luminosity+
365GeV Higgs factory with 1.5ab^{-1} integrated luminosity.

Ed L. Berger, Q. Bi, K. Chai, J. Gao, Y. Liu and HZ, to be appeared.

$$\delta\alpha_b \sim 34^\circ$$

Results

- 240GeV Higgs factory with 5.6ab^{-1} integrated luminosity+
365GeV Higgs factory with 1.5ab^{-1} integrated luminosity.

Ed L. Berger, Q. Bi, K. Chai, J. Gao, Y. Liu and HZ, to be appeared.

Summary

Conclusion

- The non-SM Yukawa interactions between the Higgs boson and SM fermions are definitely new physics beyond the SM.
- The phases in the Yukawa interactions are evidence of new sources of EWSB and might be important for us to understand the matter-antimatter asymmetry in our universe.
- We propose a method for measuring the phases for the bottom-quark Yukawa interaction directly at Higgs factory.

Thank you!
