Geometry updates: holes implementation

- New flags on CgemGeomSvc related to the effective density:

- in BesCgemConstruction.cxx: `m_CreateHole(true)`

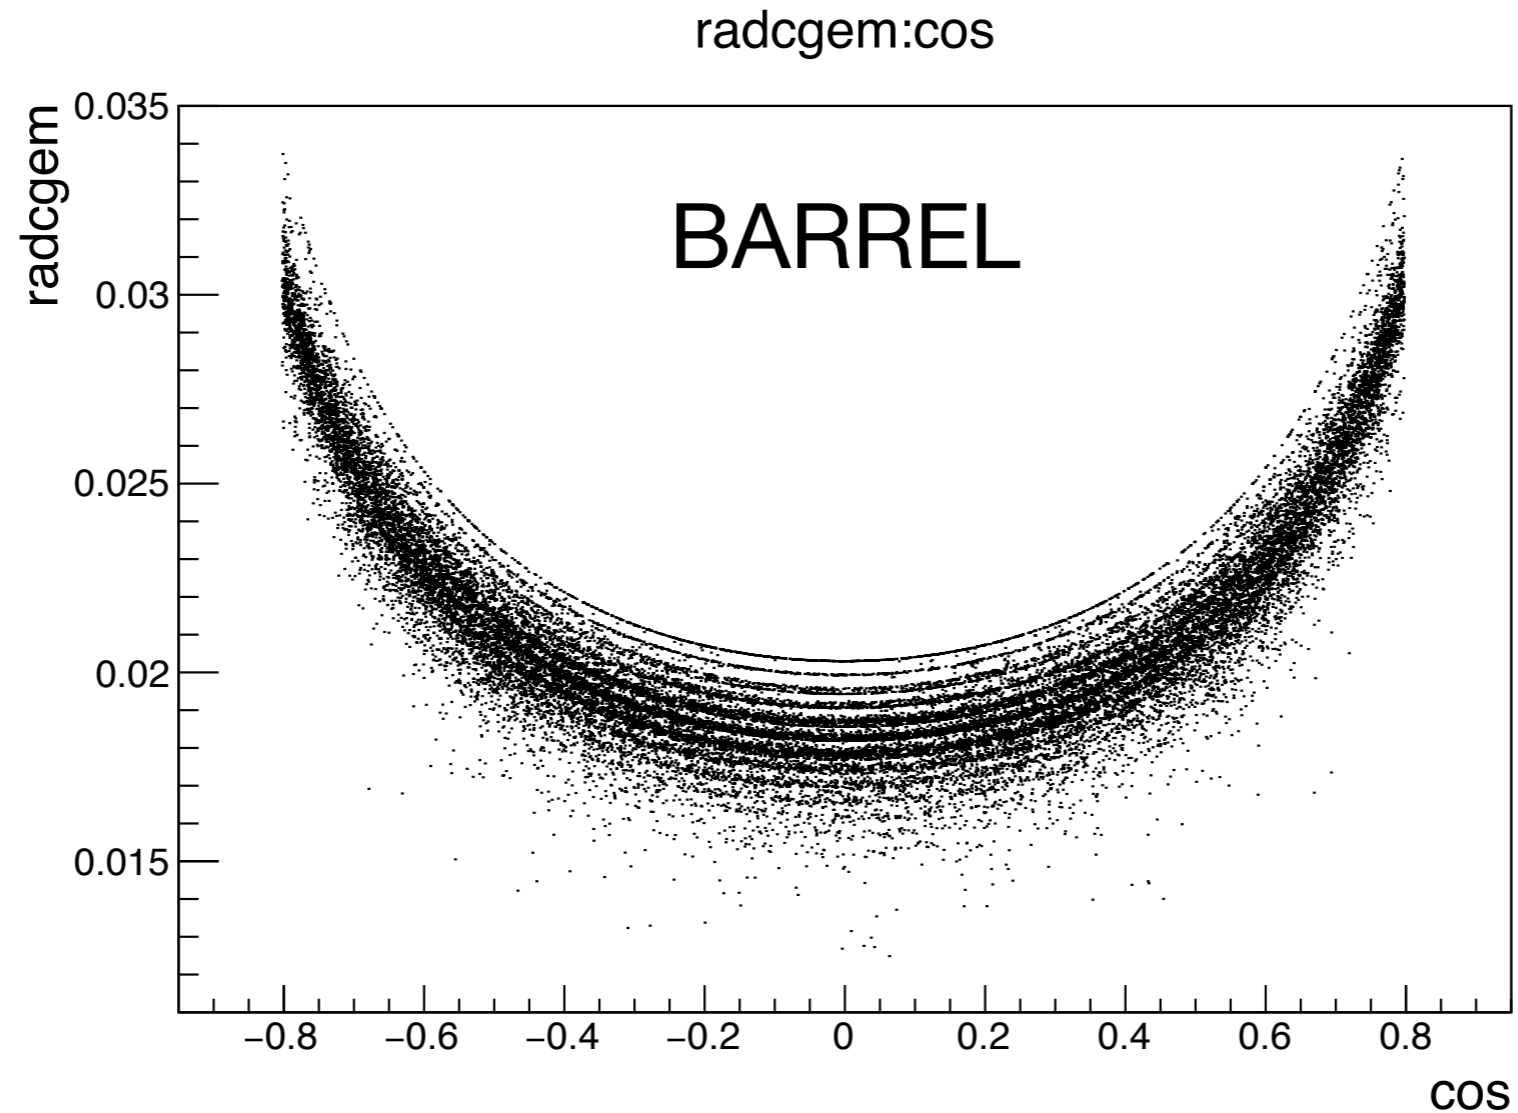

```
// Use effective density for CGEM holes and strips approximation  
CgemGeomSvc.UseEffectiveDensityHoles = false;  
CgemGeomSvc.UseEffectiveDensityStrips = false;
```

- Update CgemGeoFoil.h:

```
double getInnerR0fCgemFoilHole()           const {return          m_R_i_GemFoil_Hole ;}  
double getOuterR10fCgemFoilHole()         const {return          m_R_o1_GemFoil_Hole ;}  
double getOuterR20fCgemFoilHole()         const {return          m_R_o2_GemFoil_Hole ;}  
double getLengthOfCgemFoilHole()          const {return          m_L_GemFoil_Hole;}
```

- Update CgemSim-01-00-33
 - BesCgemConstruction.cxx → holes implementation
 - effective density

Radiation Length with holes implementation

All contributions included (shield, gas and air)

Update X [holes]

radcgem-radAir-radCgemGas:cos

Barrel

- ✓ CGEMBOSS 6.6.5.f
- ✓ Effective density: on
- ✓ Create Holes: on

CGEM

radcgem-radAir-radCgemGas:cos

Endcap

radcgem-radAir-radCgemGas:cos

Geometry updates

To do:

- CgemGeomSvc-00-00-34 → CgemGeomSvc-00-00-35
- CgemSim-01-00-33 → CgemSim-01-00-34

Hough efficiency for good tracks

Single Pion simulation:

- NO CUTS
- $R_{xy} < 1$ cm and $R_z < 10$ cm
