

# Geometry for Reconstruction in CEPCSW

# Roadmap

- Gaudi service for geometry parameters
  - /CEPCSW/Detector/GeoSvc existing

```
class GeoSvc: public extends<Service, IGeoSvc> {
public:
    GeoSvc(const std::string& name, ISvcLocator* svc);
    ~GeoSvc();

    // Service
    StatusCode initialize() override;
    StatusCode finalize() override;

    // IGeoSvc
    dd4hep::DetElement getDD4HepGeo() override;
    dd4hep::Detector* lcdd() override;

    const gear::ZPlanarParametersImpl* getVXDParameters() override;
    const gear::GearParametersImpl* getDetParameters(std::string name) override;

private:
    // DD4hep XML compact file path
    Gaudi::Property<std::string> m_dd4hep_xmls{this, "compact"};

    //
    dd4hep::Detector* m_dd4hep_geo;
};

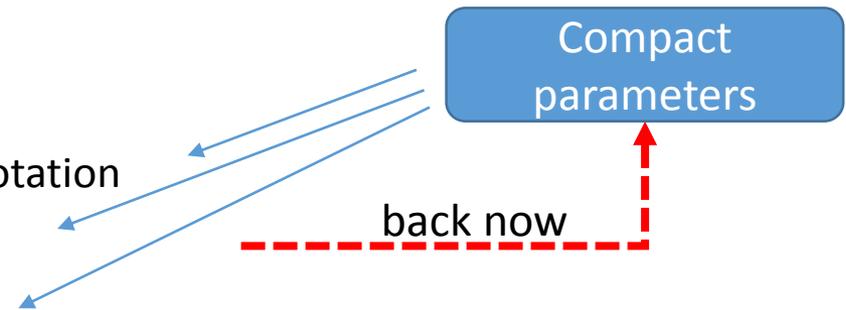

#endif GeoSvc_h
```

# Roadmap

- Geometry parameters pack
  - GearParametersImpl etc. (as external classes), Gear will keep only these parts in CEPCSW
  - In future, new classes by ourselves?

- Converter

- DD4hep geometry
- Geant4 volumes
  - Physical volumes → position & rotation
  - Logical volumes → material
  - Solid → size

- Usage

- `const gear::VXDParameters& pVXDDetMain = gearMgr.getVXDParameters();`
- `onst gear::VXDParameters& pVXDDetMain = m_geoSvc->getVXDParameters();`

# Status

- GeoSvc test ok!
  - DD4hep geometry
    - world & daughters points ok
    - Position, rotation, size & material X
  - Geant4 solid/volumes points
    - world & daughters points ok
    - Position, rotation, size & material ok
    - Back to compact parameters in progress
- KalDet
  - from GearMgr to GeoSvc in progress
