Update

To add the drift chambers in the CEPCSW :

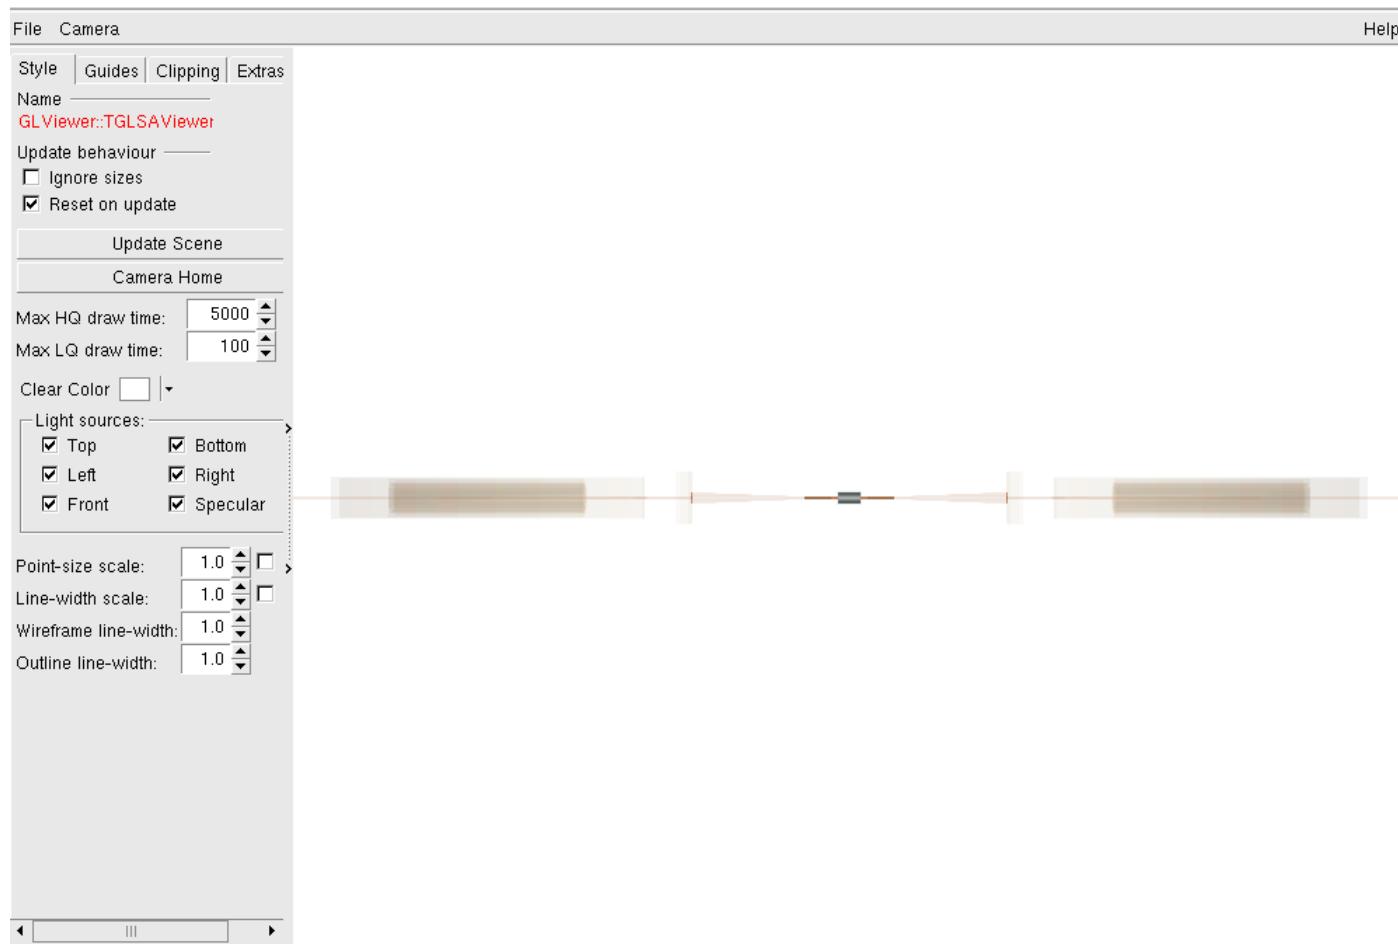

- Read the information

<https://github.com/HEP-FCC/FCCSW/blob/master/Detector/doc/DD4hepInFCCSW.md>

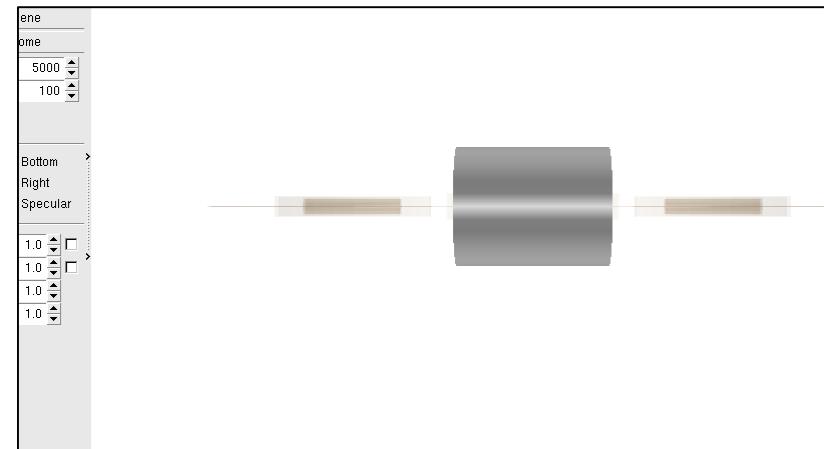

<https://cds.cern.ch/record/2670936/files/CERN-ACC-2019-0043.pdf>

- A quick confirmation of current settings in the CEPCSW
- try the visualization to have a confirmation tool

Visualization as a confirmation tool

-- reflecting “display” settings in the configuration file

Command : ./run geoDisplay -compact CepC_v4-onlyVXD.xml (left fig.)

./run geoDisplay -compact CepC_v4-onlyTracker.xml (right fig.)

Next Steps

- Follow a drift chamber configuration of the IDEA
Top & DCH configuration files

https://github.com/HEP-FCC/FCCSW/blob/master/Detector/DetFCCEeIDEA/compact/FCCEe_DectMaster.xml

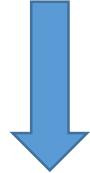

<https://github.com/HEP-FCC/FCCSW/blob/master/Detector/DetFCCEeIDEA/compact/DriftChamber.xml>

- + some other configuration settings, necessary for the CEPCSW
factory method corresponding to the configuration (detector type)

https://github.com/HEP-FCC/FCCSW/blob/master/Detector/DetFCCEeIDEA/src/parametrised_DriftChamber.cpp

-- would need further understanding , such as realization of “sensitive area” for the VXD in the CEPCSW is not understood yet.

Next Steps

- Compilation & visualization
- Confirmation of Hit information (sensitive area)
 if it works . . .
- adjust the dimension for a proto-MDC
