About CEPC

ECM=240GeV, higgs factory, 100 km circumference, 2 Interaction Points.

ILD-like detector

signal samples: MadGraph+Pythia8

simulation: Mokka

reconstruction: Marlin

Signal process: smuon mass 80, 90, 100, 110, 115, 119 GeV with LSP mass 1, 10, 20, ... , ( $m_{smuon}-10$ ), ( $m_{smuon}-5$ ), ( $m_{smuon}-1$ ) GeV, each with 100, 000 events.

consider backgrounds with final state mumu or tautau.

SR1	SR2
=2 OS muon	
$\Delta R(\mu, recoil) < 3$	
$\Delta\phi(\mu, \mu) > 0.1$	
$E_\mu > 40 GeV$	$E_\mu < 45 GeV$
$M_{\mu\mu} < 60 GeV$	
$M_{recoil} > 25 GeV$	$M_{recoil} > 140 GeV$

When use  $\Delta\phi(\mu, \mu) > 0.1$ , there are more bkg events, which decreases sensitivity with large systematic uncertainty.

# Summary

A sensitivity study is done for direct smuon and C1C1 decay via WW in CEPC.

Dominant backgrounds are considered.

Signal Region is from cut scan, evaluated by sensitivity.

The result sensitivity is promising.

Although the sensitivity of some signal processes at the edge is not good enough with large systematic uncertainty, the sensitivity can be improved in the future.

Thank you.
