## CEPC Silicon Drift Chamber Tracker

Xin Shi

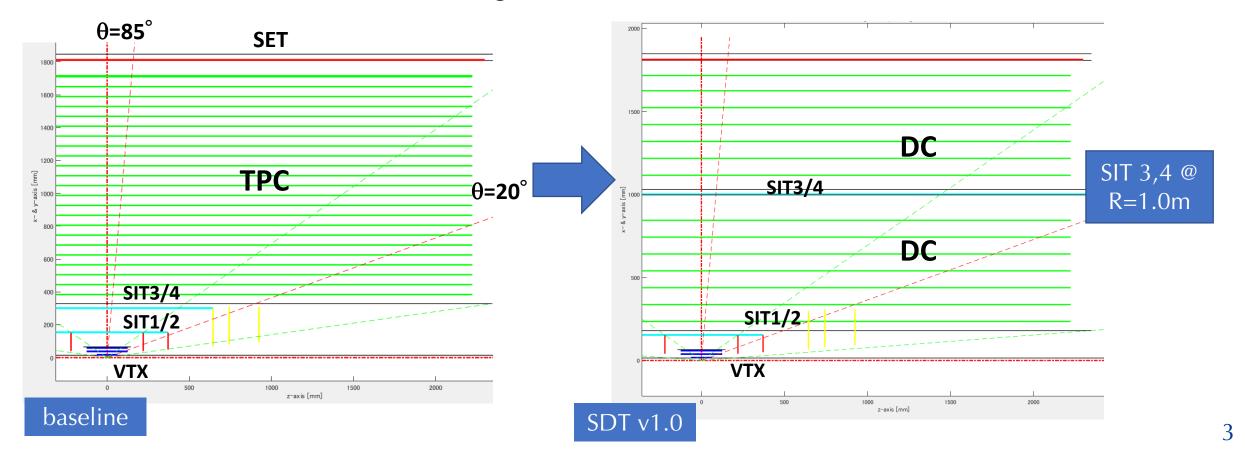

Gang Li, Ryuta Kiuchi, Mingyi Dong, Jianchun Wang

### Motivation for Silicon Drift chamber Tracker (SDT)

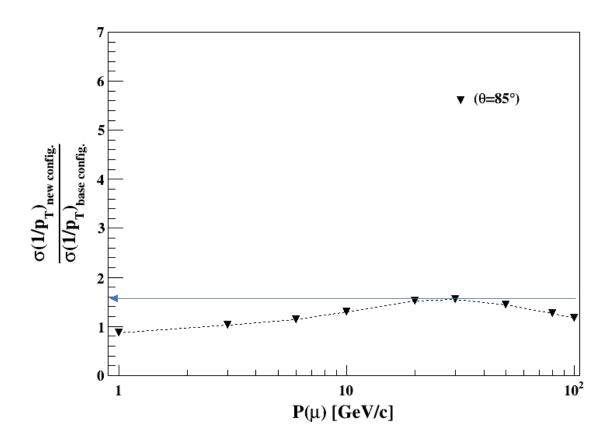

- Explore a different tracker option for CEPC
- Capable for both tracking and particle ID (flavor, JES, jet flavor,...)
- Combine the Silicon technology (strip, CMOS) and Drift chamber technology (dE/dx, cluster counting, ...)
- Provide concrete platform to integrate smaller crystal ECAL
- Open path for better particle ID with faster timing layer (LGAD) between SDT and crystal ECAL

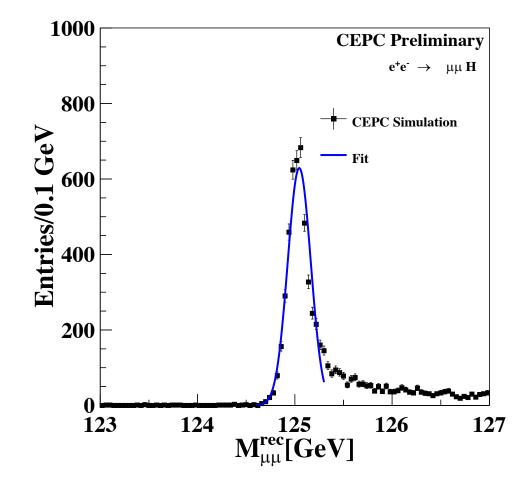

## CEPC SDT v1.0 recap

- Based on the baseline Silicon + TPC
- Replace TPC layers with two drift chamber layers
  - SIT 3&4 set at R=1.0m / larger cell size of DC than TPC

### SDTv1.0: Momentum and recoil mass resolution

- < 1.6 degradation for momentum resolution
  - Can be improved with more silicon layers

~12% increase for recoil mass resolution

### SDT v2.0

- Switch to CEPCSW: <a href="https://github.com/cepc/CEPCSW">https://github.com/cepc/CEPCSW</a>
  - Implement SDT basic configuation
  - Straight cell structure along beam axis
  - Extract dE/dx & PID sepration

                                                                                 </lccdd>
```

# Simulation Settings

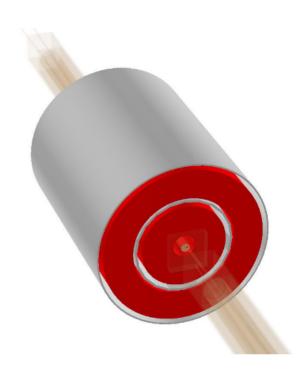

• Tracker: VXD – SIT1/2 – MDC1 – SIT3/4 – MDC2 – SET

#### Two Drift chambers:

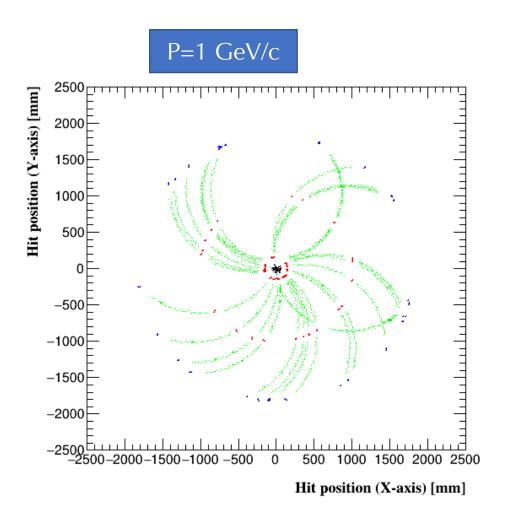

- cell size: 10mm
- number of layers: 133
- R: 0.3m to 1.8m
- gas mixture:  $Ar:CH_4:CO_2 = 93\%:5\%:2\%$  argon, methane and carbon dioxide taken from CDR TPC

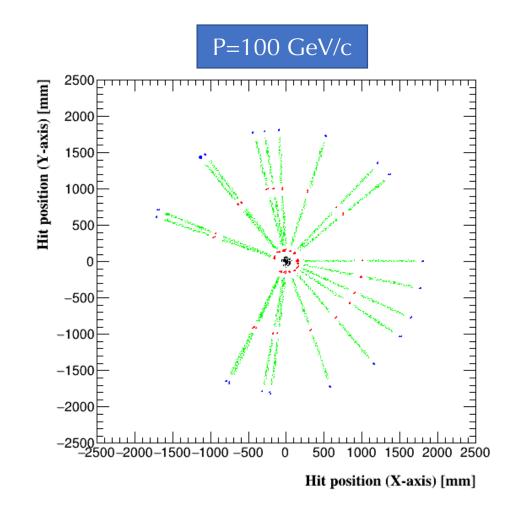

#### • Particle injection:

- polar angle=85° for pion and kaon
- particle gun momentum: 0.5, 0.75, 1, 3, 5, 10, 50, 100 GeV
- 2000 events for each setting

# Hit map for pion with $\theta = 85^{\circ}$ and B = 3T

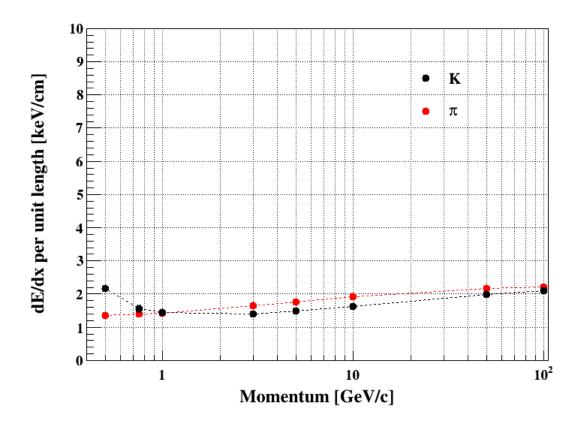

Dots represent hits for VXD (Black), SIT (Red), MDC1/2 (Green), SET (Blue)

## dE/dx distribution

• Energy deposit per unit length (=10mm)

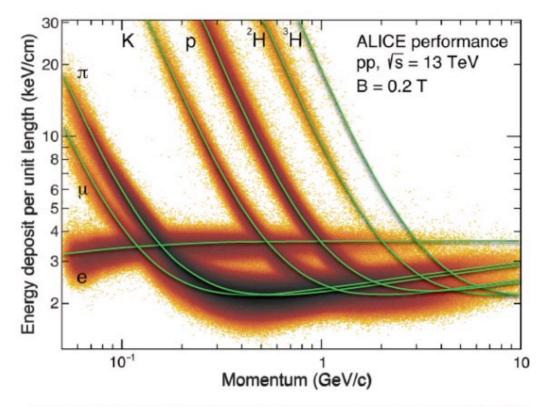

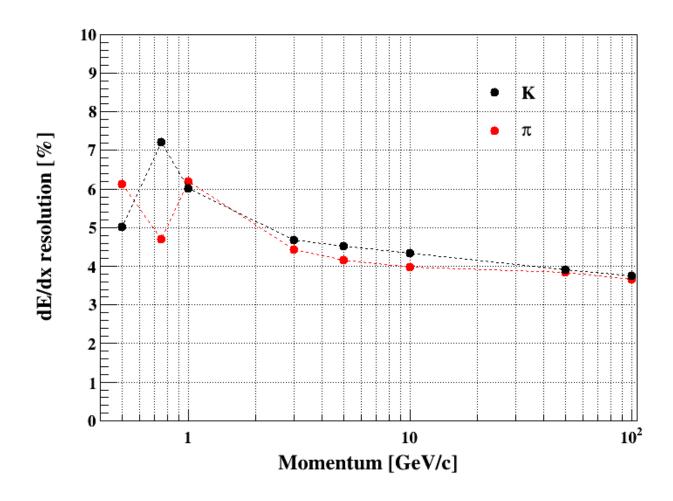

Figure 35.15: Energy deposit versus momentum measured in the ALICE TPC.

Energy deposition from GEANT4 with 90% truncation ratio

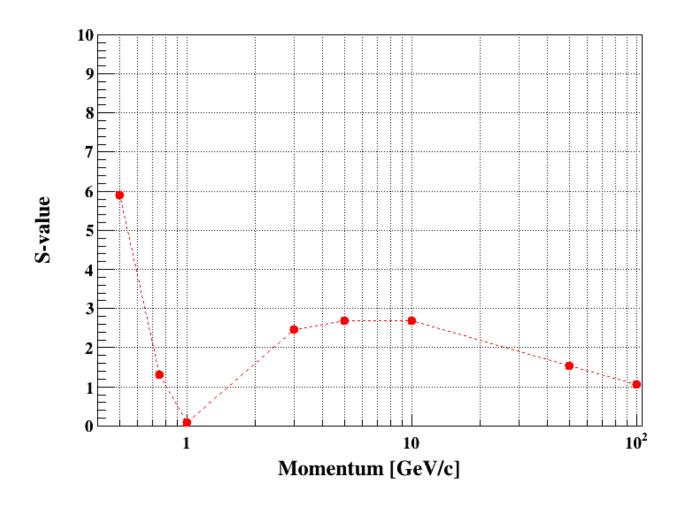

## Resolution of dE/dx

Resolution defined by (Gaussian) sigma/Mean

# S-value (PID performance)

• S-value distribution for  $K/\pi$  case

## Summary and Plan

- First look of dE/dx of SDT using the new softwre framework CEPCSW
  - Thanks for the strong support from the software team!
- Obtained distributions silmilar with references
- Next:
  - Investigate cluster counting to better dE/dx 2%
  - He based gas mixture (He: i-C4H10 = 90%:10%)
    - Lower material budget
    - Number of ionization cluster ~12/cm, allow for cluster counting
    - Suggested for IDEA and MEGII drift chamber
  - Smaller tracker volume (R=1.5) for crystal ECal
  - More layers of silicon for better momentum resolution
  - Signal digitization effect, GarField, ...
