- Study the effect of μ_{qqZZ} normalisation factor of the $qqZZ$ background.
- Signal region:
 - $220 < m_{4\ell} < 2000$ GeV
 - $\Delta\eta_{jj} > 4.0$ & $N_{\text{jets}} \geq 2$ GeV
- Adding only the normalisation systematic uncertainties for the samples.

| | 4μ | $4e$ | $2\mu 2e$ | 4ℓ |
|-----------------------|------------------|-----------------|------------------|------------------|
| $qq \rightarrow ZZ^*$ | 18.92 ± 0.35 | 9.90 ± 0.24 | 25.58 ± 0.53 | 54.41 ± 0.68 |
| VBFB | 4.27 ± 0.03 | 2.85 ± 0.03 | 7.12 ± 0.04 | 14.24 ± 0.06 |
| SBI | 3.47 ± 0.03 | 2.29 ± 0.02 | 5.75 ± 0.04 | 11.52 ± 0.05 |
| SBI5 | 4.57 ± 0.03 | 3.11 ± 0.03 | 7.67 ± 0.04 | 15.36 ± 0.06 |
| SBI10 | 6.68 ± 0.04 | 4.75 ± 0.04 | 11.35 ± 0.06 | 22.77 ± 0.08 |

- Also, the systematic uncertainty for the luminosity is added.
- The signal POI, $\mu_{\text{off-shell}}$, is parametrised using SBI and SBI5 only.
- Simultaneously fit the 4μ , $4e$, $2\mu 2e$ and 4ℓ channels.
- The fit is performed on the Asimov data generated by setting POI to 1.0.

- Floating the $qqZZ$ normalisation improve the $\mu_{\text{off-shell}}$ by $\sim 6\%$.

- The $\mu_{\text{off-shell}}$ is improved by $\sim 6\%$ when floating the $qqZZ$ normalisation.
- However, it could be more than that when including all the systematic.
- Also, there's a problem including the statistical uncertainties in the fit.
- We need to fix that and then look at the MELA and CR.

Thanks!
