## EMCal Development for sPHENIX Experiment

The scientific objective of the sPHENIX experiment is to gain an understanding of the evolution of the system and its coupling strength at RHIC from the initial high temperatures. It will address fundamental questions about the nature of the strongly coupled quark-gluon plasma (QGP). This will be accomplished by using hard-scattered partons that traverse the medium and the Upsilon states to investigate the medium at the different length scales.

The EMCal (Electromagnetic Calorimeter) performance is central to the direct photon and Upsilon measurements and it is also a key component, along with the hadronic calorimeter, of the calorimetric jet reconstruction. The calorimeter will play a major role in both the measurement of jets and single photons out to high pT, as well as identifying and measuring the energies of the electrons from Upsilon decays.

I will focus on the development and production of EMCal. Fudan University, Peking University and CIAE will be the three EMCal module production sites. I will also present our progress of EMCal production.
