

Status of Horizontal Crystal Bar ECAL Software

Sun Shengsen

On Behalf the CEPC Calo-Software Working Group

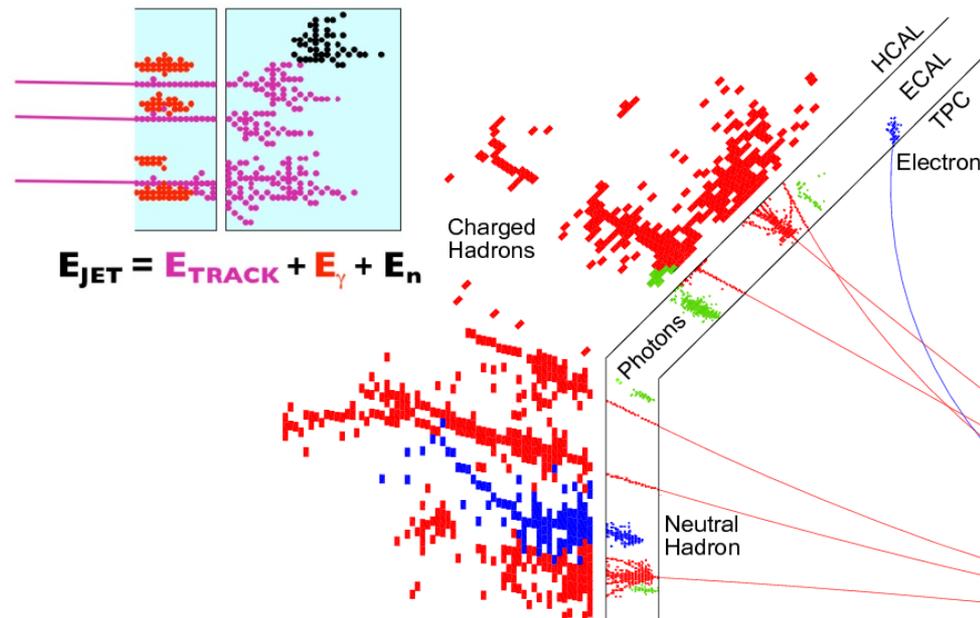

CEPC Day Feb. 25, 2021

Introduction: PFA Calorimeter

- A high precision Higgs / Z factory
 - Significance of heavy bosons depends on mass resolution, and separation also require **jet energy resolution 3~4%**
 - Fine γ/π^0 reconstruction.
- Reconstruction of every single particle in the event
 - **Charged particle** momentum measured in tracker.
 - **Photon** energies measured in ECAL.
 - **Neutral hadron** energies measured in HCAL.
- Particle flow approach (PFA) and Imaging Calorimeters
 - Identification of energy deposits from each individual particle.
 - Combination of the information of tracker and calorimeters.
 - **Hardware + Software**

Key Requirement on Detector

Physics process	Measurands	Detector subsystem	Performance requirement
$ZH, Z \rightarrow e^+e^-, \mu^+\mu^-$ $H \rightarrow \mu^+\mu^-$	$m_H, \sigma(ZH)$ $\text{BR}(H \rightarrow \mu^+\mu^-)$	Tracker	$\Delta(1/p_T) = 2 \times 10^{-5} \oplus \frac{0.001}{p(\text{GeV}) \sin^{3/2} \theta}$
$H \rightarrow b\bar{b}/c\bar{c}/gg$	$\text{BR}(H \rightarrow b\bar{b}/c\bar{c}/gg)$	Vertex	$\sigma_{r\phi} = 5 \oplus \frac{10}{p(\text{GeV}) \times \sin^{3/2} \theta} (\mu\text{m})$
$H \rightarrow q\bar{q}, WW^*, ZZ^*$	$\text{BR}(H \rightarrow q\bar{q}, WW^*, ZZ^*)$	ECAL HCAL	$\sigma_E^{\text{jet}}/E = 3 \sim 4\%$ at 100 GeV
$H \rightarrow \gamma\gamma$	$\text{BR}(H \rightarrow \gamma\gamma)$	ECAL	$\frac{\Delta E}{E} = \frac{0.20}{\sqrt{E(\text{GeV})}} \oplus 0.01$

Introduction: Crystal / Si-W ECAL

Crystal ECAL: BGO

- **Optimal energy resolution** $\frac{\sim 3\%}{\sqrt{E}} \oplus \sim 1\%$
 - Better jet energy resolution $0.17 \sqrt{E_J}$
- **Larger R_M** \rightarrow larger lateral width of a shower
 - Increase probability of showers' overlap
- **Larger λ_I/X_0** \rightarrow longitudinal development is determined by λ_I
 - Increase probability of hadronic shower in ECAL

$$\sigma_{Jet} = \sqrt{\sigma_{Track}^2 + \sigma_{Had}^2 + \sigma_{em}^2 + \sigma_{Confusion}^2}$$

Confusion is the limiting factor in PFA.

- Avoid double counting of same particle
- Separate energy from different particles

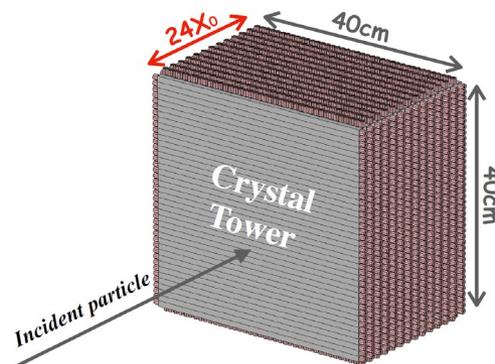

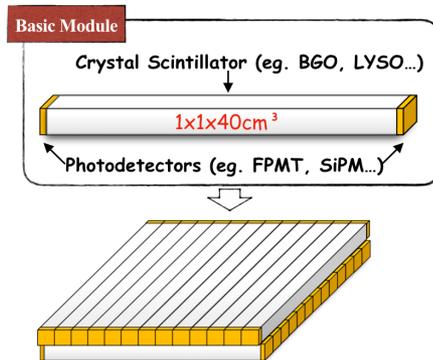

Material	X_0 /cm	R_M /cm	λ_I /cm	λ_I/X_0
W	0.35	0.93	9.6	27.4
BGO	1.12	2.23	22.8	20.3
Ratio	3.2	2.4	2.4	0.74

Component	Detector	Energy Fraction	Energy Resolution	Jet Energy Resolution
Charged Particles (X^\pm)	Tracker	$\sim 0.6 E_J$	—	—
Photons (γ)	ECAL	$\sim 0.3 E_J$	$0.15 \sqrt{E_\gamma}$ $0.03 \sqrt{E_\gamma}$	$0.08 \sqrt{E_J}$ $0.016 \sqrt{E_J}$
Neutral Hadrons (h^0)	HCAL	$\sim 0.1 E_J$	$0.55 \sqrt{E_{h^0}}$	$0.17 \sqrt{E_J}$

Horizontal Crystal Bar Solution for ECAL

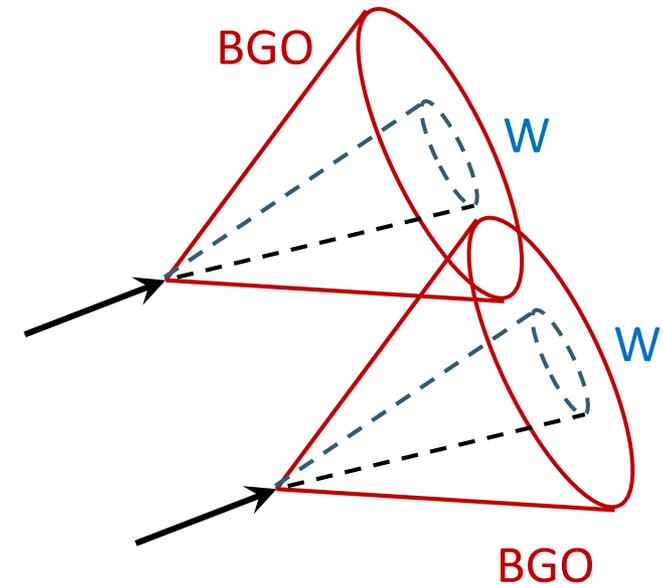

ECAL design

- Material: BGO
- Optimal energy resolution $\frac{\sim 3\%}{\sqrt{E}} \oplus \sim 1\%$
- Long bar size: $1 \times 1 \times \sim 40 \text{ cm}^3$
- Time measurement at both ends for position along bar.
- Crossed arrangement in adjacent layers
- Super Cell: two adjacent layers
- Cube: $\sim 40 \times \sim 40 \times 24X_0 \text{ cm}^3$
- Significant reduction of number of channels

Key Issues

- Ambiguity caused by 2D measurements
- Separate energy deposits from different particles

Reconstruction is a big challenge

Geometry Construction

A BGO crystal barrel ECAL

Crystal Bar:

- BGO: $X_0 = 1.12\text{cm}$, $R_M = 2.23\text{cm}$
- Size: $1 \times 1 \times \sim 40\text{ cm}^3$
- Both ends readout

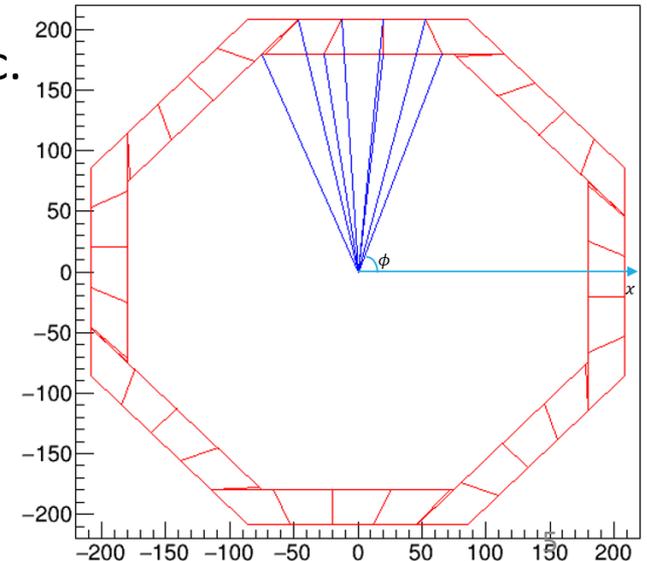

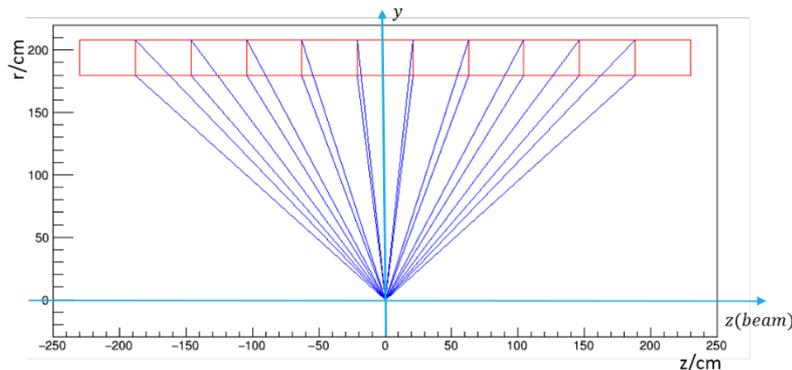

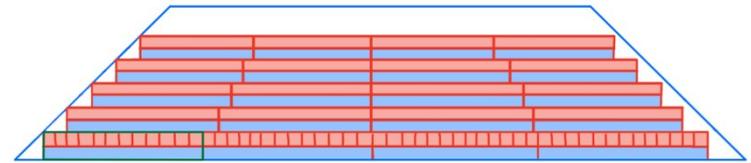

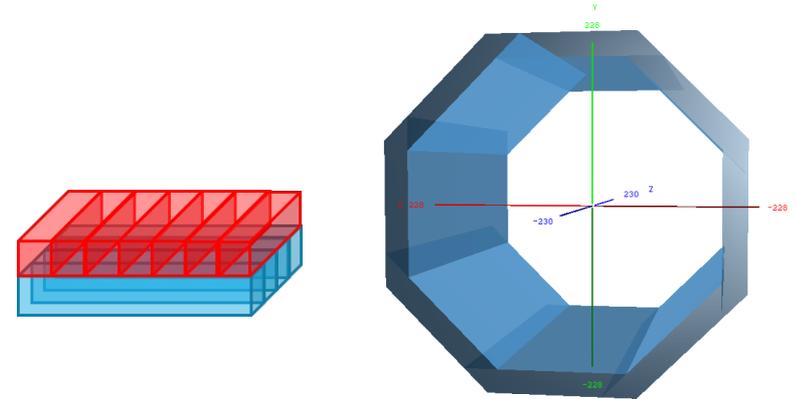

Basic Detection Unit — Super Cell

- 2 layers of perpendicularly crossing bars
- Size: $\sim 40 \times \sim 40 \times 2\text{ cm}^3$

Detector

- $R = 1.8\text{m}$, $L = 4.6\text{m}$, $H = 28\text{cm}$
- 8 same trapezoidal staves
- Avoid gaps point to IP

Ideal detector without electronics, supporting, etc.
DD4Hep is used for geometry construction

Simulation and Digitization

- ◆ A standalone full simulation for extraction of time resolution
 - Optical photon processes: scintillation, Cherenkov, absorption, refraction/reflection at boundaries

- Simulation is performed using GEANT4
 - Electromagnetic interactions
- Digitization for one long crystal bar
 - Contribution of each G4step i

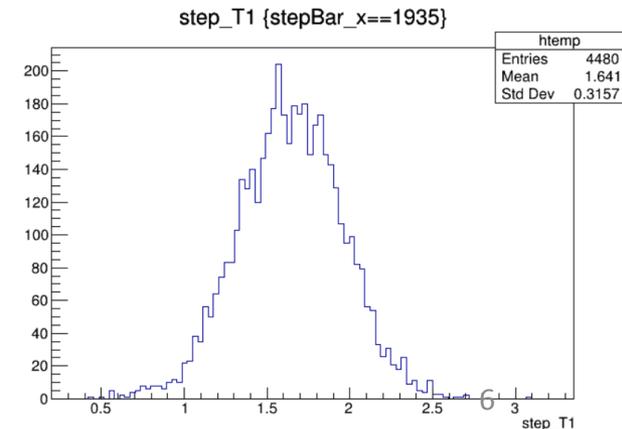

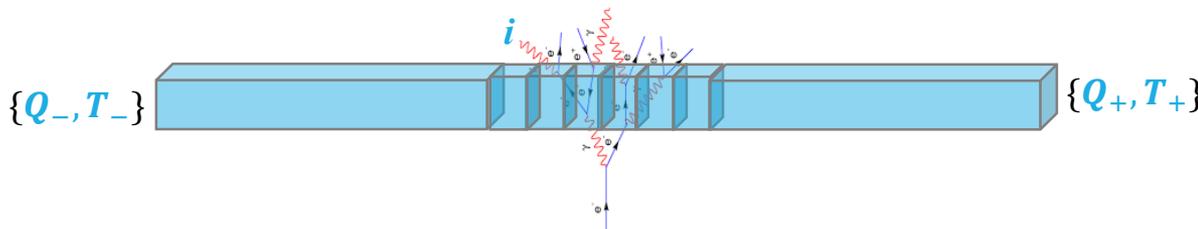

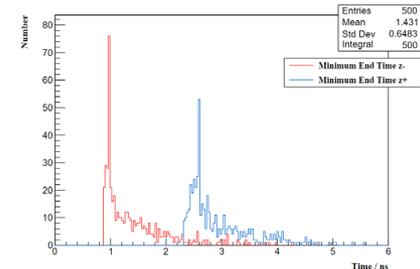

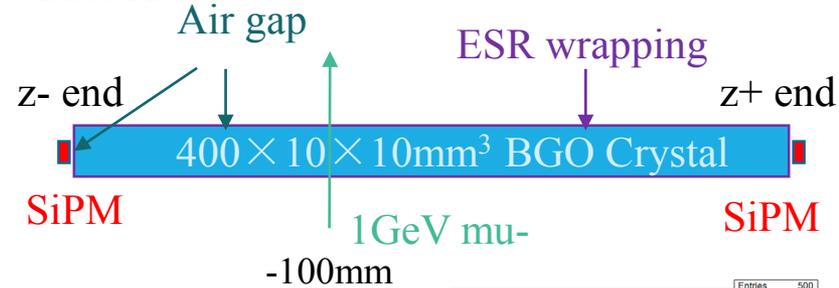

$$Q_{\pm}^i = E_0 \cdot e^{-\frac{L/2 \pm z_i}{L_{Atten}}}, \quad T_{\pm}^i = T_0 + Gaus(z_{\pm}^i/v, \sigma_T)$$

adopt time resolution obtained in full simulation

- Readout at both ends: Q_{\pm} and T_{\pm}

$$Q_{\pm} = \sum_{step} Q_{\pm}^i, \quad T_{\pm} = T_{\pm}^k \mid (\sum_{i=1}^k Q_{\pm}^i > thres)$$

Simplified Conditions: $L_{Atten} = \infty$

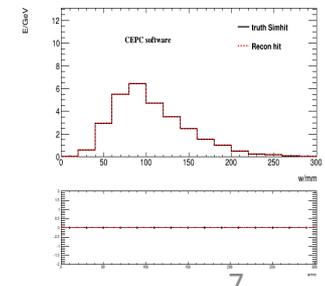

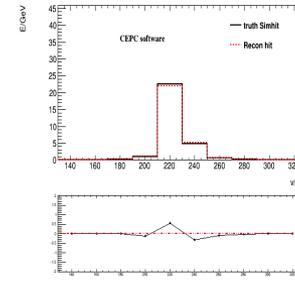

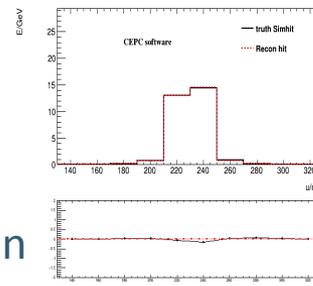

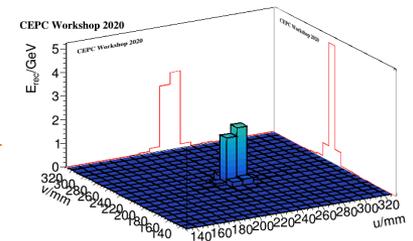

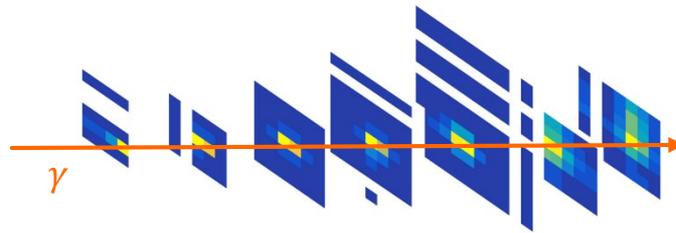

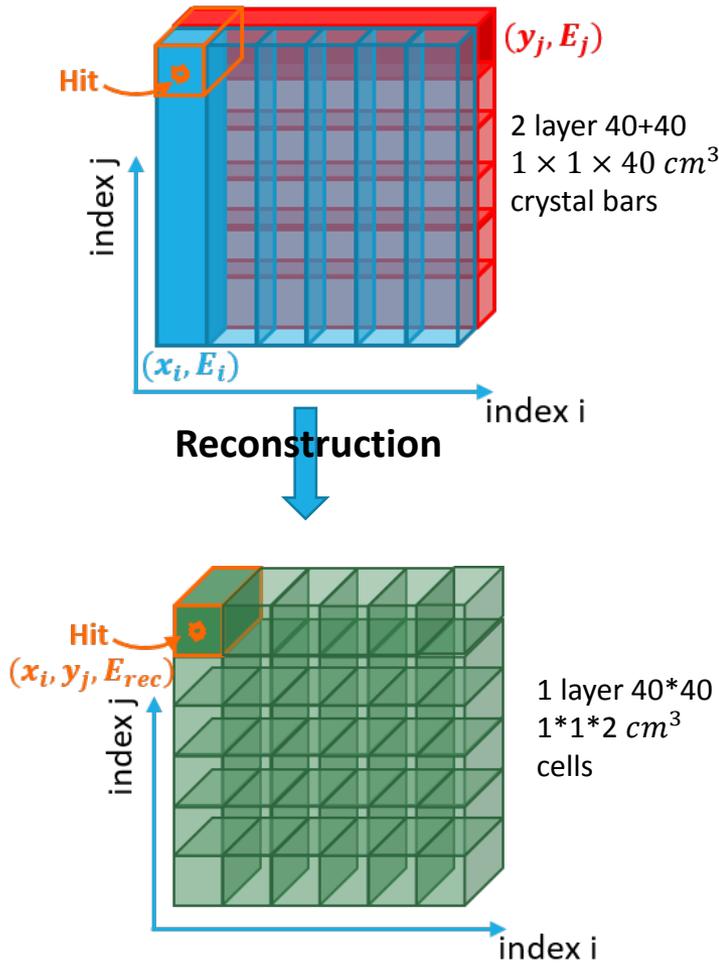

Hit Reconstruction

In a super cell

- Position: $(x_i, y_j, \frac{z_i+z_j}{2})$
- Energy: use energy distribution in adjacent layer as fractions

$$E_{rec}^{hit_{ij}} = E_i \times f_i + E_j \times f_j,$$

$$f_i = \frac{E_j}{\sum E_j}, \quad f_j = \frac{E_i}{\sum E_i}$$

2D measurements provide 3D information

Reconstruction: Clustering and Splitting

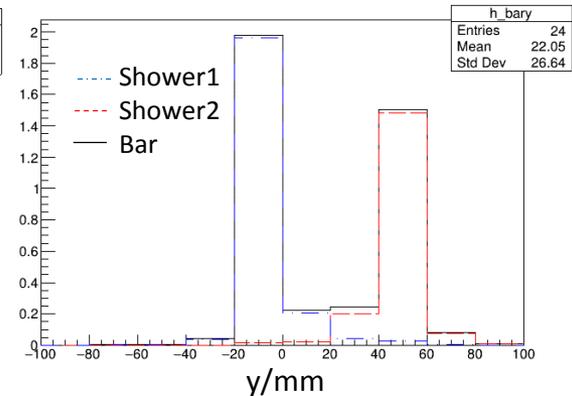

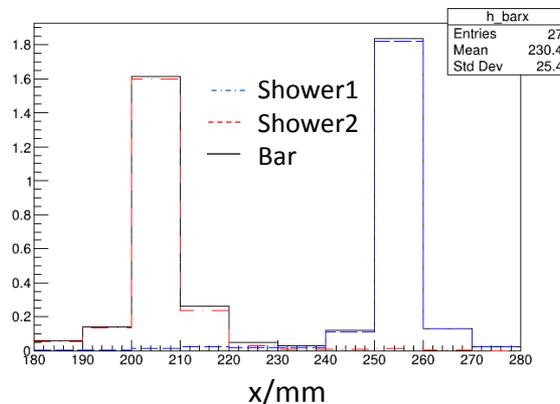

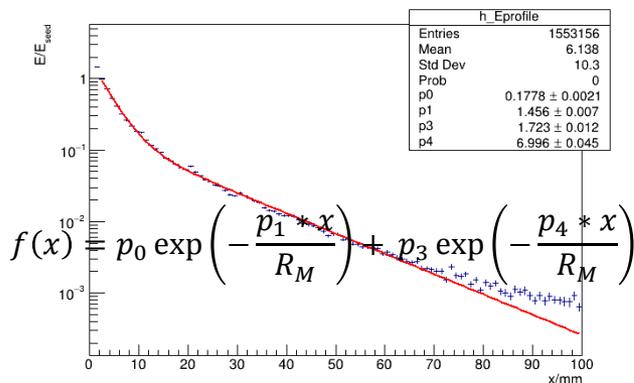

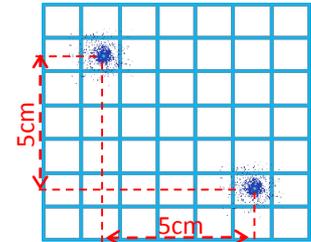

In each layer / 1D reconstruction:

Clustering / Seed Finding

- Neighbor clustering
- Local maximum and seed candidate $E_i > E_{th}^{seed}$

Energy Splitting

- $N_{seed} \geq 2$ && second moment $S > S_{th}$ (0 now)
- Energy of shower μ deposited in bar i : $E_{i\mu}^{exp} = E_{\mu}^{seed} \times f(|x_i - x_c|)$
- Energy splitting: $E_{i\mu} = w_{i\mu} \times E_{mea}^i = \frac{E_{i\mu}^{exp}}{\sum_{\mu} E_{i\mu}^{exp}} \times E_{mea}^i$
- Iteration until convergence

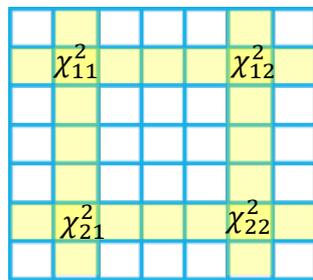

Reconstruction: Energy / Time Matching

Showers in perpendicular X/Y bars of one super cell come from one particle

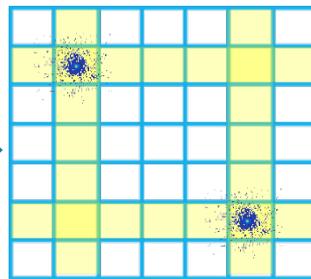

In one super cell (2 layers)

- Define χ_E^2 for energy matching: $\chi_E^2 = \frac{(E_X - E_Y)^2}{\sigma_E^2}$
- Define χ_T^2 for time matching: $\chi_T^2 = \frac{(z_T - z_Y)^2}{\sigma_S^2 + \sigma_Z(t)^2}$
- Define $\chi_{point}^2 = \chi_E^2 + \frac{1}{2}(\chi_{Tx}^2 + \chi_{Ty}^2)$
- Totally N! combinations: $\chi_c^2 = \sum_{i=1}^N \chi_{point}^2$

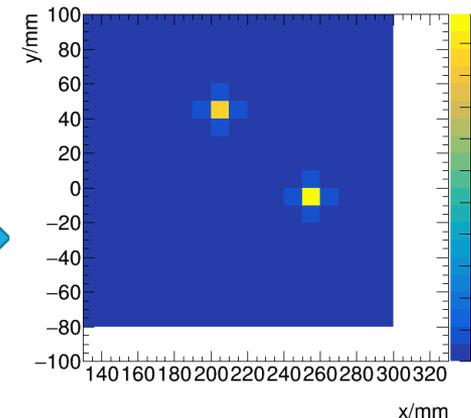

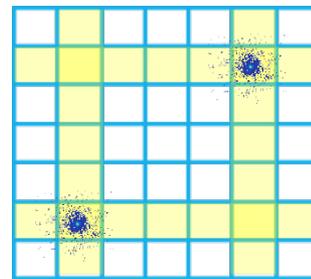

one layer of a super cell

$\chi_{c1}^2 = 31.9$

$\chi_{c1}^2 = 52.3$

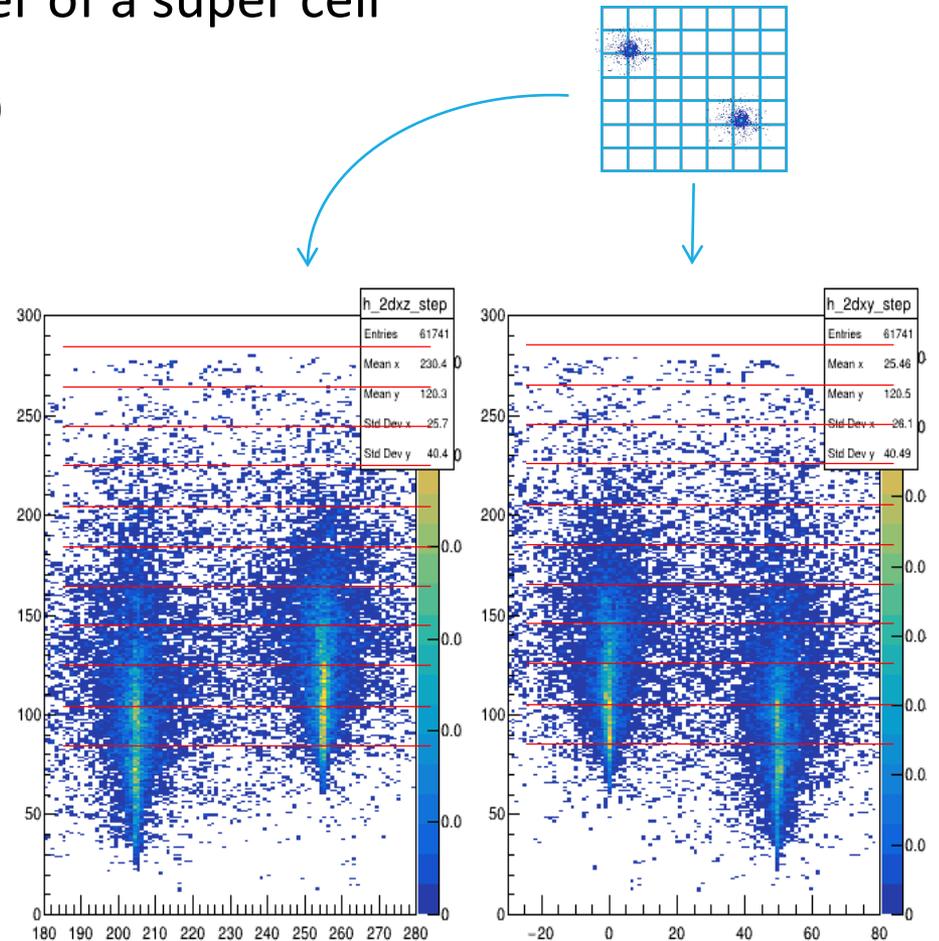

Reconstruction: Energy / Time Matching

Energy and time matching in one layer of a super cell

$$\chi_{point}^2 = \chi_E^2 + \frac{1}{2} (\chi_{Tx}^2 + \chi_{Ty}^2)$$

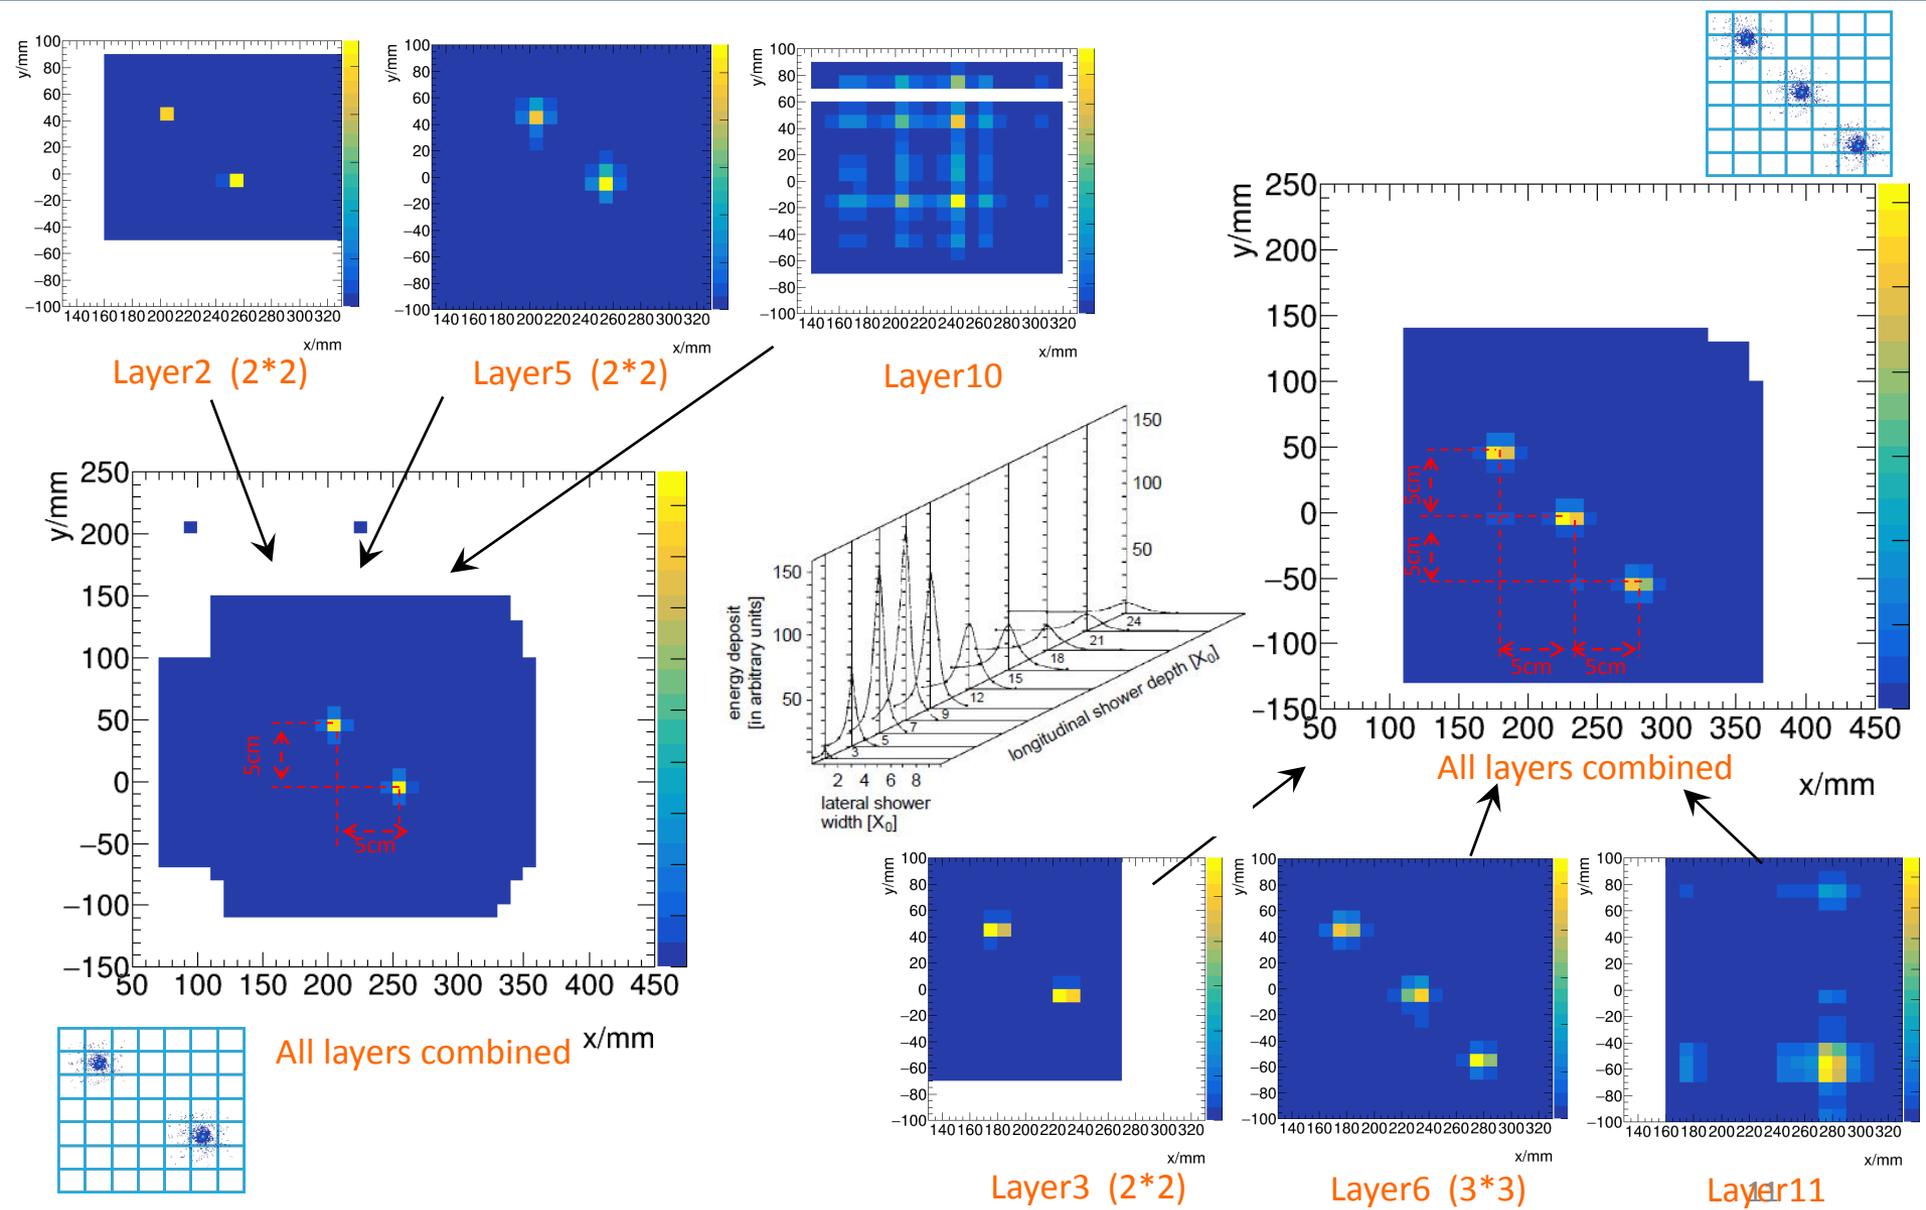

Depth/mm	Nshower	Eshower1	Eshower2
20	1	0.051	
40	1	0.527	
60	2	1.378	0.135
80	2	1.781	1.313
100	2	2.138	2.192
120	2	1.507	2.252
140	2	0.715	2.070
160	2	0.547	1.171
180	2	0.314	0.540
200	2	0.218	0.346
220	1		0.275
240	1		0.146
260	1		0.067

Energy and time matching provide a solution of ambiguity / ghost hits!

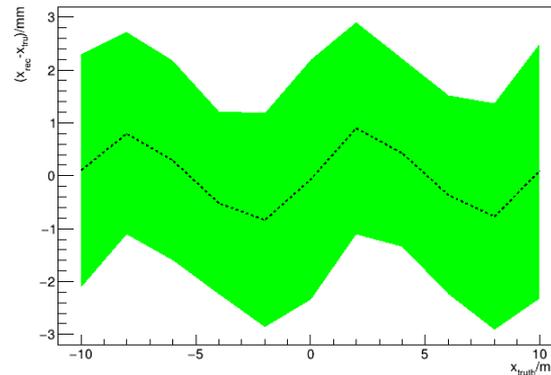

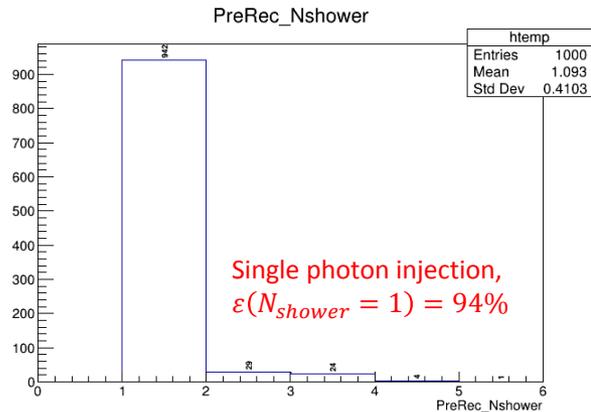

Better performance is expected with further optimization.

Some Validations

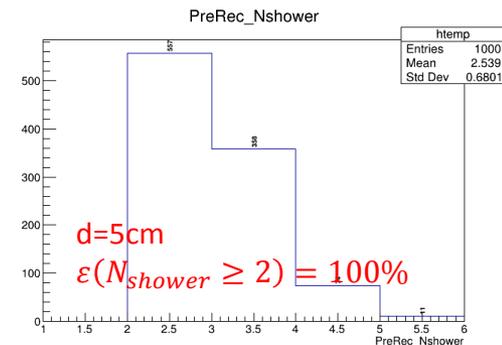

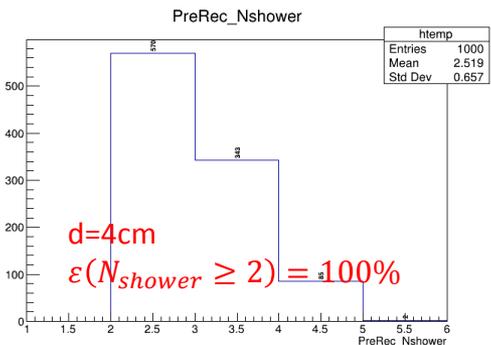

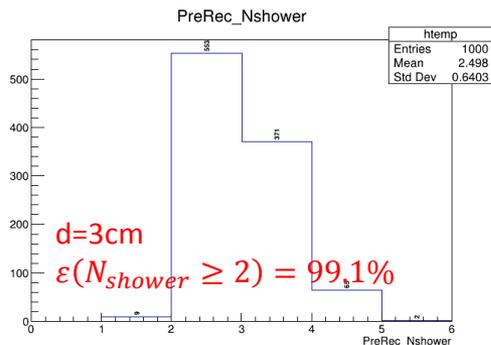

Performance Checks

Performance check with photon events: correct rate, position resolution

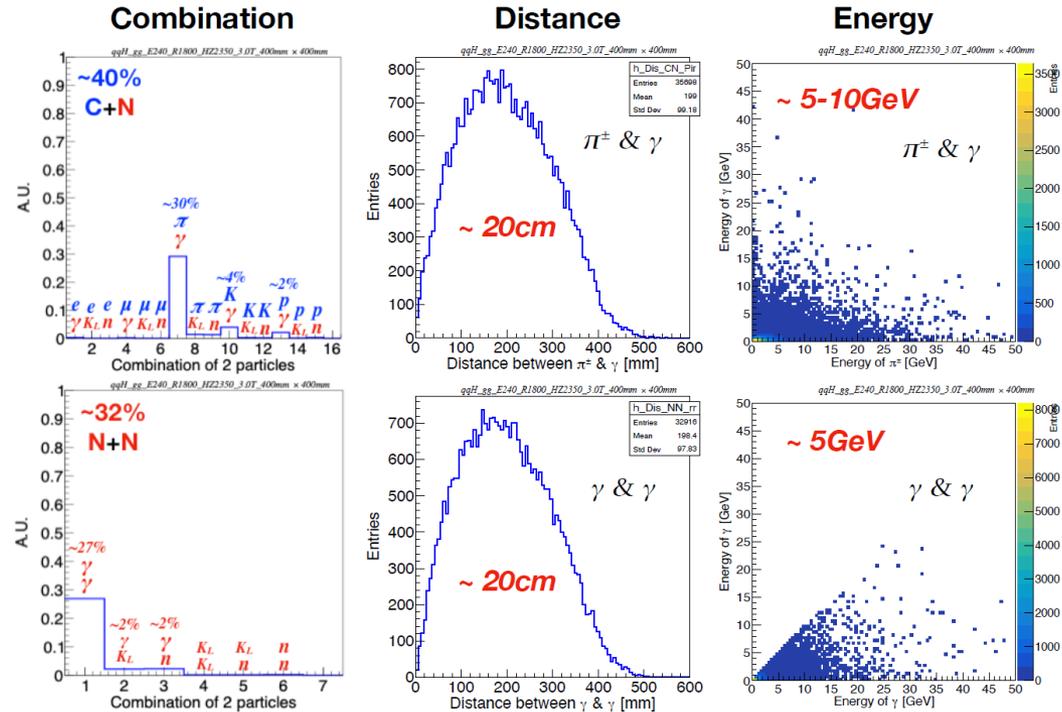

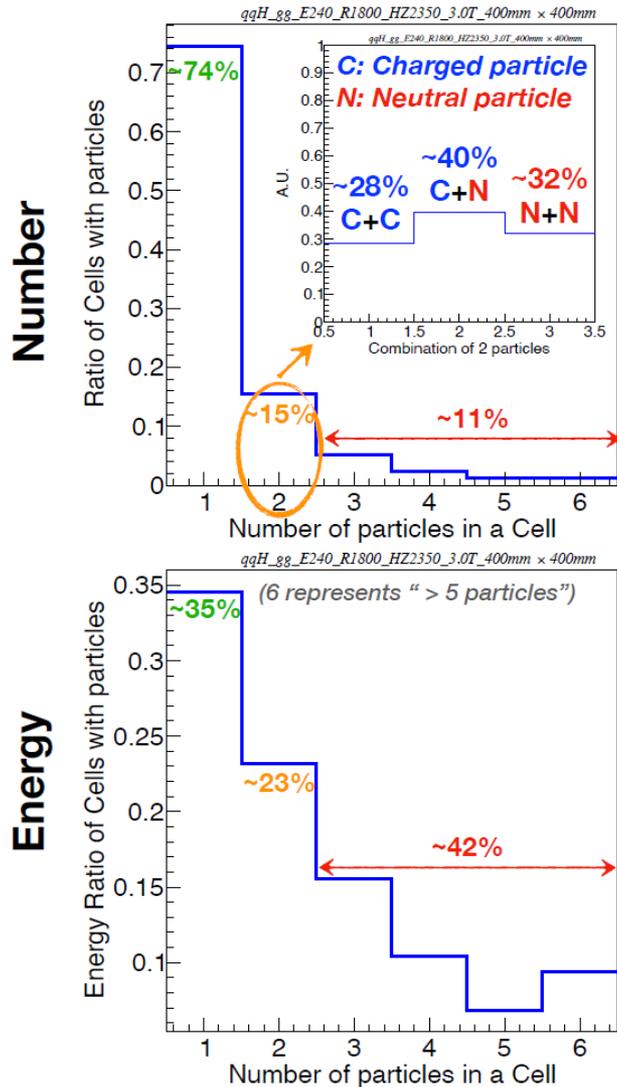

x residual and resolution.
Scan the inject position
from -1cm~1cm.
Need position correction.

More seeds / showers are found in latter half of the cluster development.
Possible introduce more *confusions*, Optimization is expected.

Discussions: Multiplicity

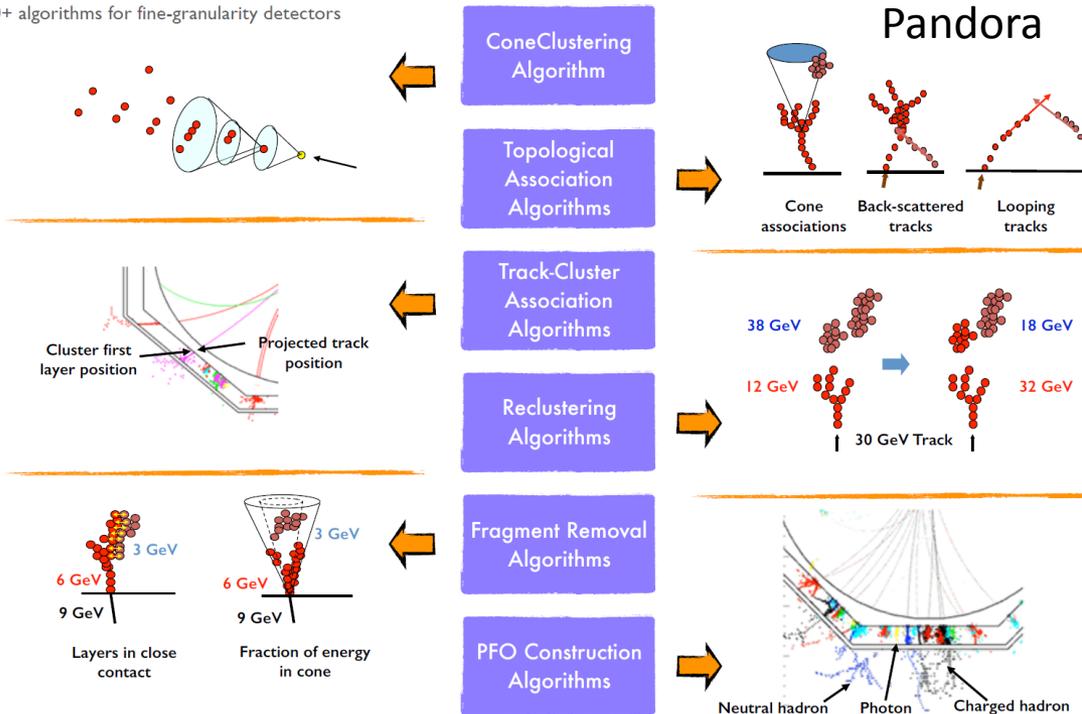

Cube with 2 particles: distance and energy distribution

- 11% Cubes with >2 particles, 42% energy of 4-jet event with >2 particle
- Average distance between 2 particles in one cube is ~20cm.

Multiplicity in a 40cm × 40cm cube

Discussion: Clustering

60+ algorithms for fine-granularity detectors

- Highly granular sampling calorimeter: e.g. Si-W
 - Best separation for narrow showers
 - W: $X_0 \sim 3mm, R_M \sim 9mm$
 - Active elements: $\sim 0.5cm^3$ segmentation
 - Each ECAL hit associate with one incident particle, no energy sharing.

Arbor

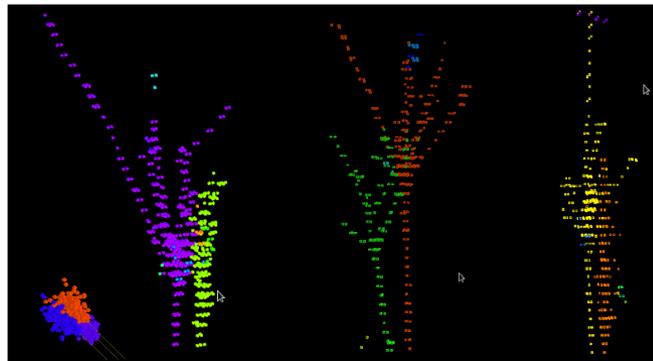

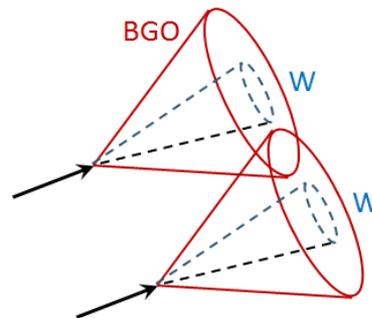

Figure 7: Nearby showers reconstructed by Arbor. The display at left corner shows three nearby photon clusters, while the other three display shows nearby hadron showers

Crystal Showers

- Crystal calorimeter: e.g. BGO
 - BGO: $R_M \sim 2cm, \lambda_I/X_0 \sim 20.3$
 - Larger lateral development require a high performance energy splitting algorithm
 - R&D of a new dedicated PFA software for crystal ECAL

Discussion: Moliere Radius

Material	X_0 /cm	R_M /cm	λ_I /cm	λ_I/X_0
W	0.35	0.93	9.6	27.4
Cu	1.43	1.52	15.1	10.6
HGCAL		2.854		
BGO	1.12	2.23	22.8	20.3
Ratio	3.2	2.4	2.4	0.74

CMS HGCAL

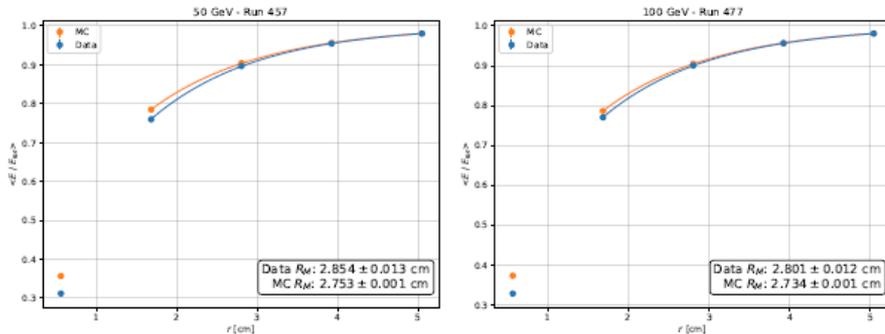

Figure 15: $\langle E(r)/E \rangle$ as a function of r for nominal positron energy of 50 GeV (left) and 100 GeV (right) in data (black points) and simulation (red circles). The R_M is extracted from the fitted exponential function defined in Eq. 18 using $(E(R_M)/E) = 0.9$.

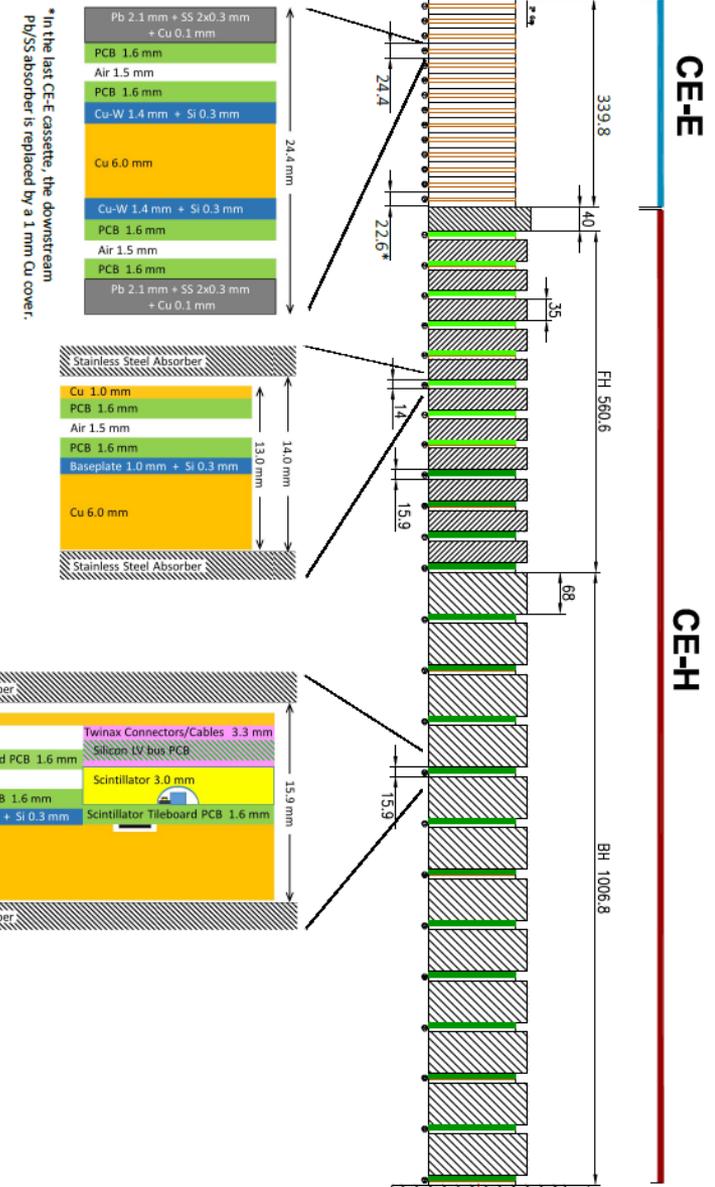

Figure 15: Longitudinal structure of the HGCAL, with schematic cross-sections of the three types of cassettes: CE-E cassettes, CE-H silicon sensor cassettes, and CE-H mixed silicon/scintillator cassettes. In the mixed cassettes the cross-hatched region is shared by the scintillator and silicon services in different angular regions.

Plan and Summary

- Particle Flow ECAL requires an **efficient separation** of showers from charged hadrons, photons and neutral hadrons. *Confusion* is limiting factor of jet energy resolution.
- *Ambiguity* of perpendicular crystal bars is promising to be removed with established software solution.
- Crystal has better energy resolution, larger X_0 and R_M , smaller λ_I/X_0 , to foresee more overlap. High performance energy splitting algorithm is developing to decrease this contribution to confusion term.
- Unique characteristics of crystal ECAL requires **dedicated and advanced reconstruction techniques** making full use of the 5D information (x, y, z, E, t).

Thank you for your attention!
