QUARKS (purple text on the left side of the quark section)

LEPTONS (green text on the left side of the lepton section)

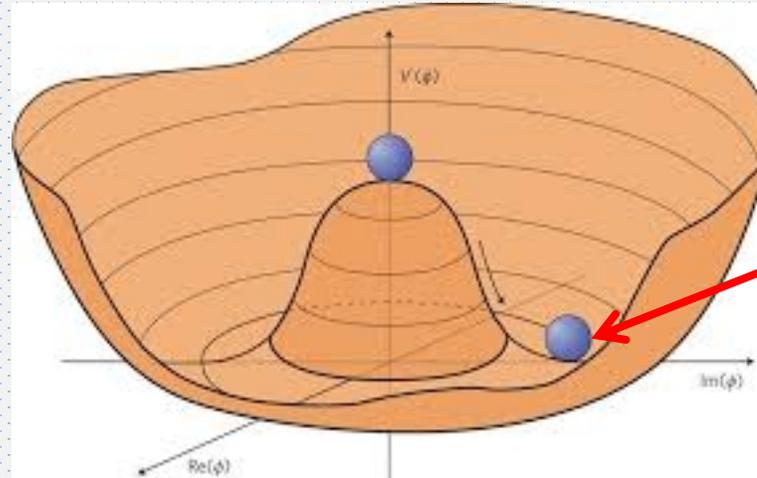

GAUGE BOSONS VECTOR BOSONS (red text on the right side of the gauge boson section)

SCALAR BOSONS (yellow text on the right side of the scalar boson section)

The properties of the (complete) SM particle contents are well measured, with some **exceptions**.

The Higgs Potential

At the core of the SM is the Higgs mechanism, but the Higgs potential is largely (experimentally) unknown.

Collider experiments measure the shape around the vev.

How to measure the full Higgs potential?

How to measure its evolution throughout the cosmic history?

Is there any new physics beyond those in the SM?

Higgs Cubic Coupling

(see Luca Cadamuro, Zihang Jia, Bowen zhang, Junmou Chen's talks)

Non-excluded at 95%CL (ATLAS, see also CMS's result)

single Higgs production $-3.2 < \kappa_\lambda < 11.9$ ($79.8 fb^{-1}$)

double Higgs production $-5.0 < \kappa_\lambda < 12.0$ ($36.1 fb^{-1}$)

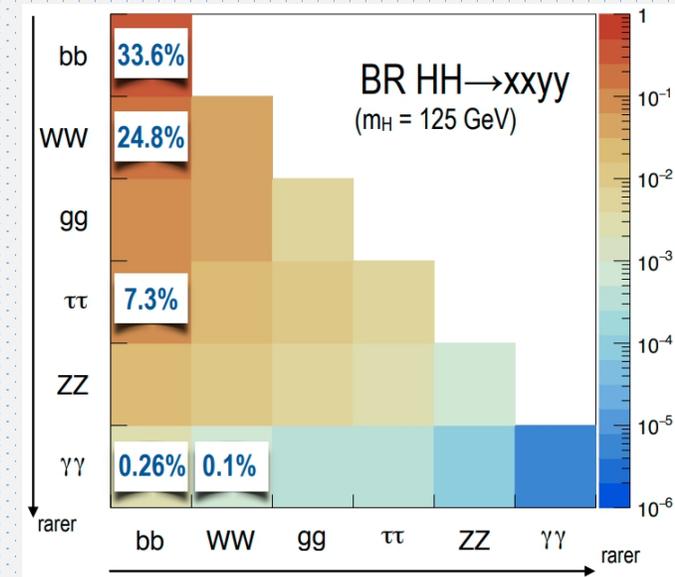

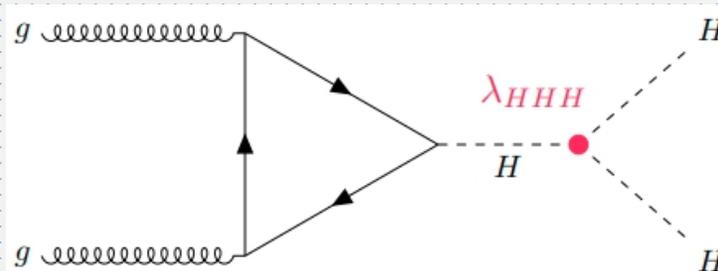

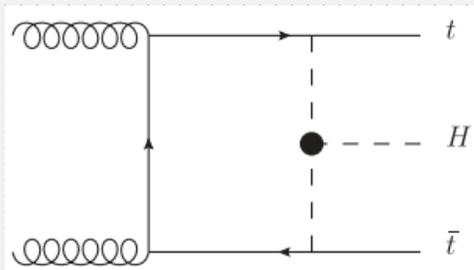

(non-resonant, channels combined)

ATL-PHYS-PUB-2019-009, 2019

ATLAS collaboration, Phys.Lett.B 800 (2020) 135103

ATLAS Combined
 $-2.3 < \kappa_\lambda < 10.3$
 ATL-PHYS-PROC-2020-114

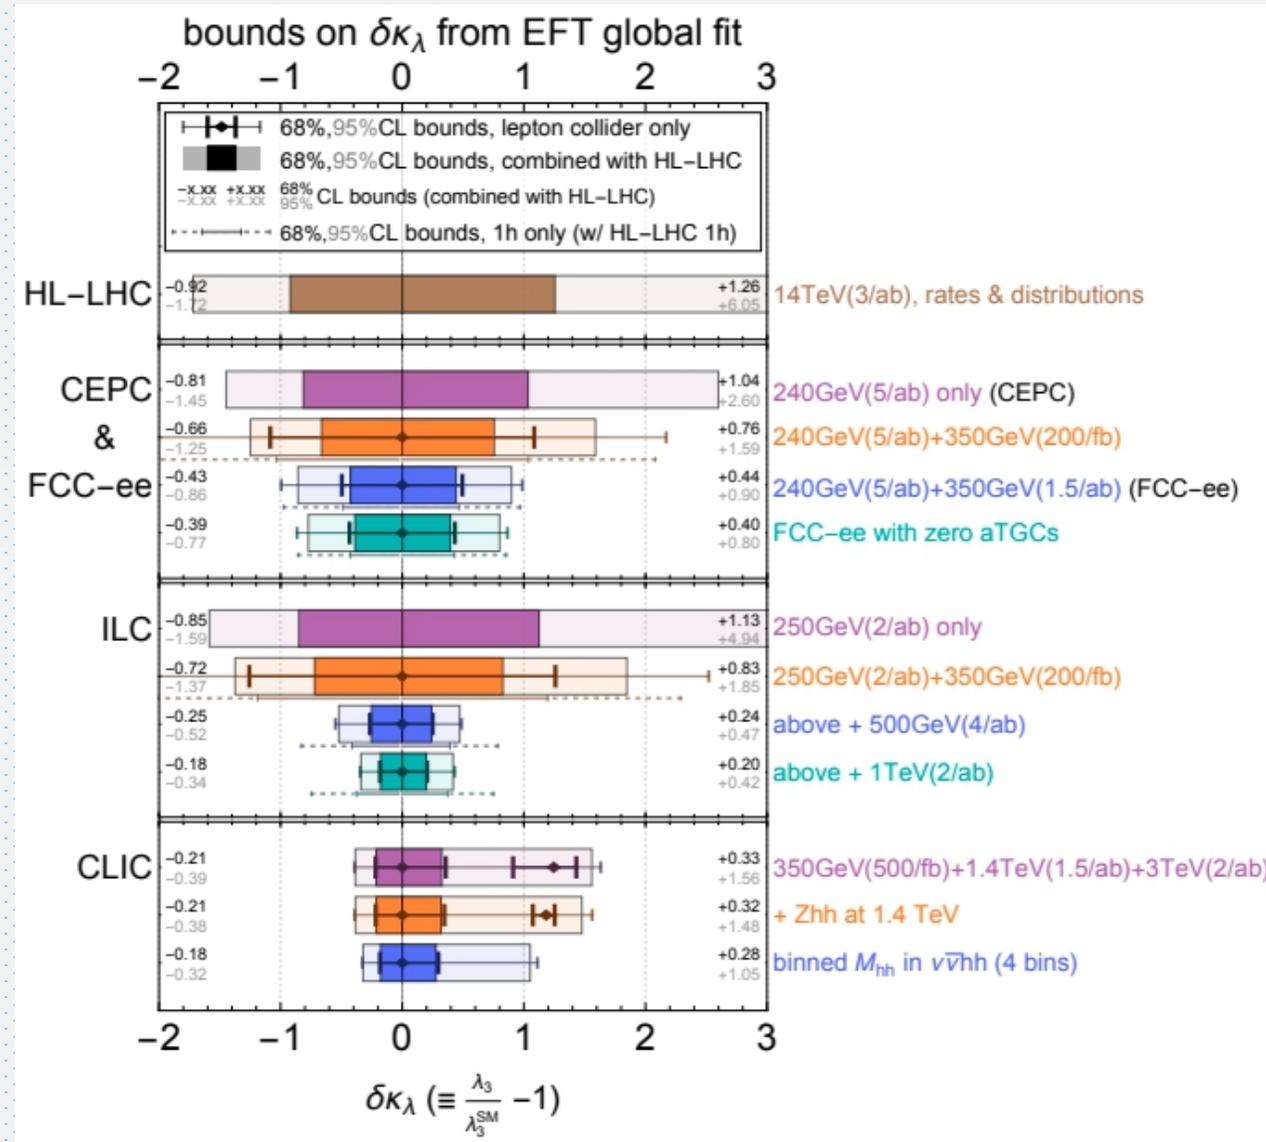

Most recent search in $bb\tau\tau$ channel (ATLAS-CONF-2021-030)

(example diagrams for single and double Higgs production)

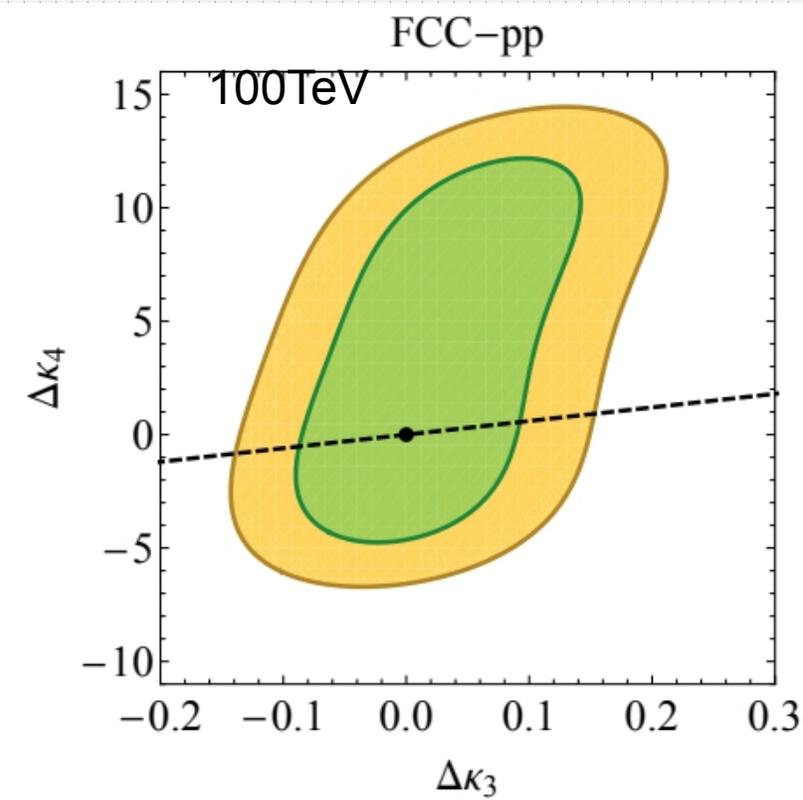

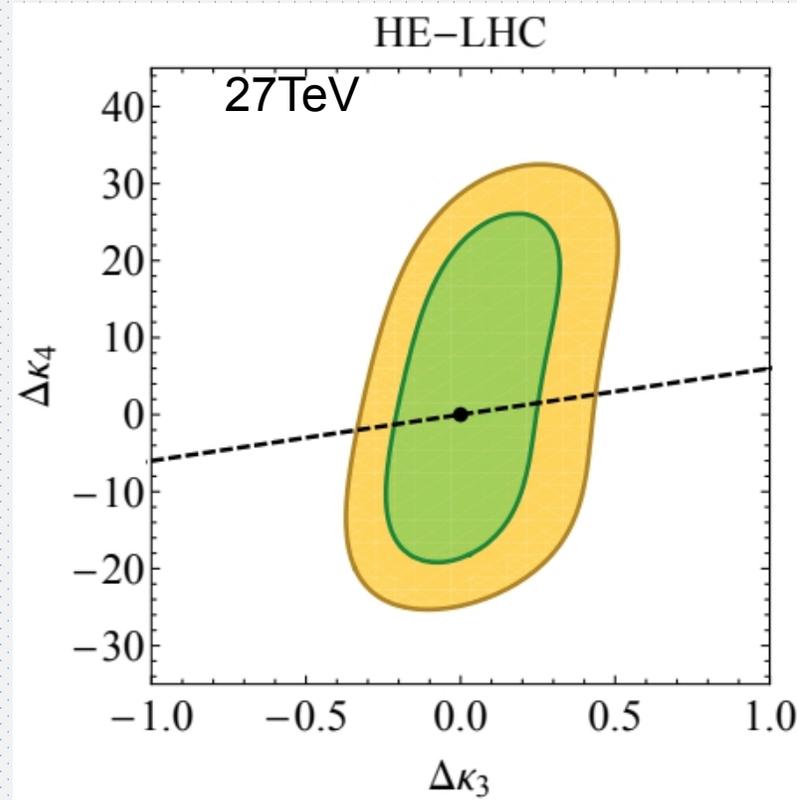

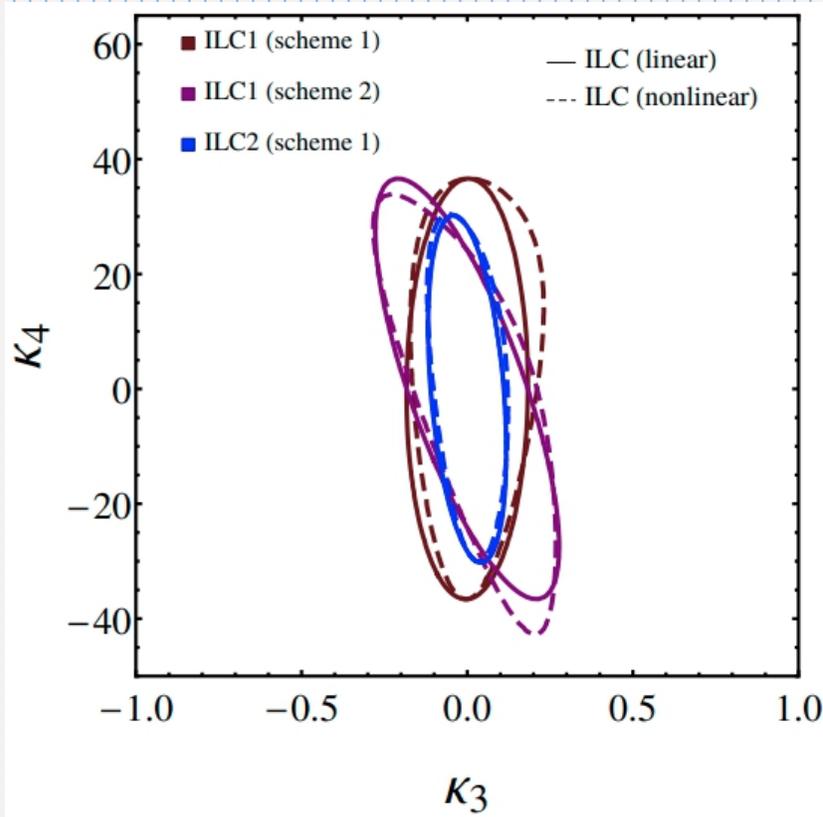

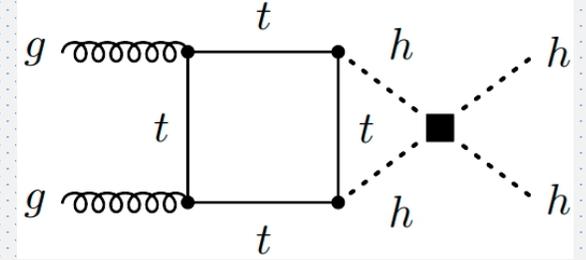

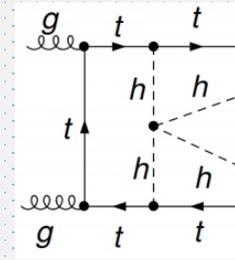

Morse, arXiv:1708.08249

Higgs Cubic Coupling

Higgs Quartic Coupling

Quartic coupling is (will be) even less constrained

Why do we need new physics?

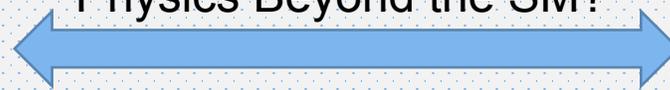

Two Standard Models, hard to reconcile with each other!

Physics Beyond the SM?

Cosmology

- What is dark matter?
- Why is there more matter than anti-matter?
- What is dark energy?

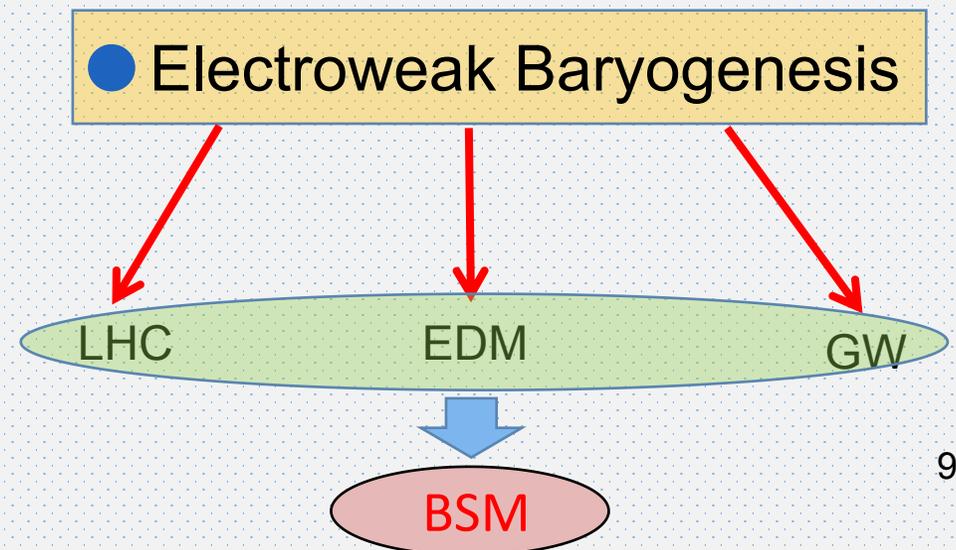

Baryon Asymmetry Generation

Sakharov conditions(1967)

- ✓ B-violation
- ✓ C, CP violation (**new physics**)
- ✓ Out-of-Equilibrium (**new physics**)

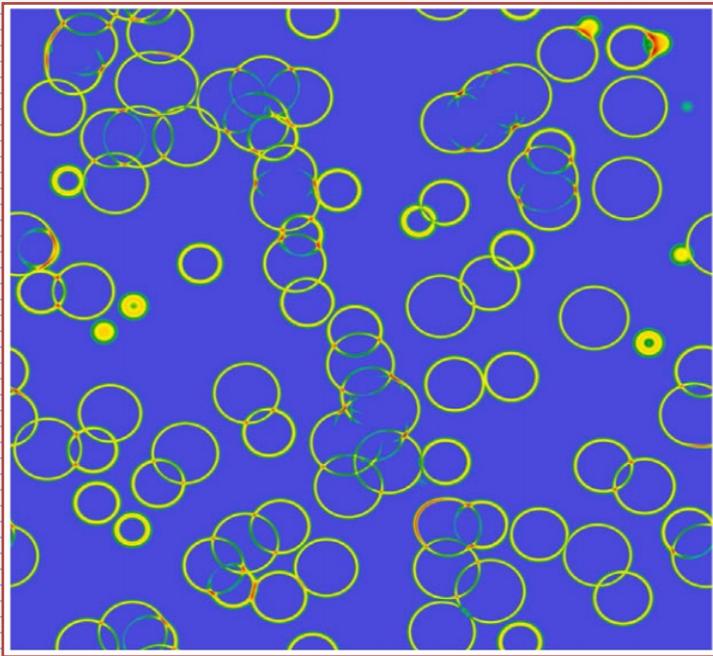

- GUT Baryogenesis
- Affleck-Dine Mechanism
- Leptogenesis
- Spontaneous Baryogenesis
- Electroweak Baryogenesis

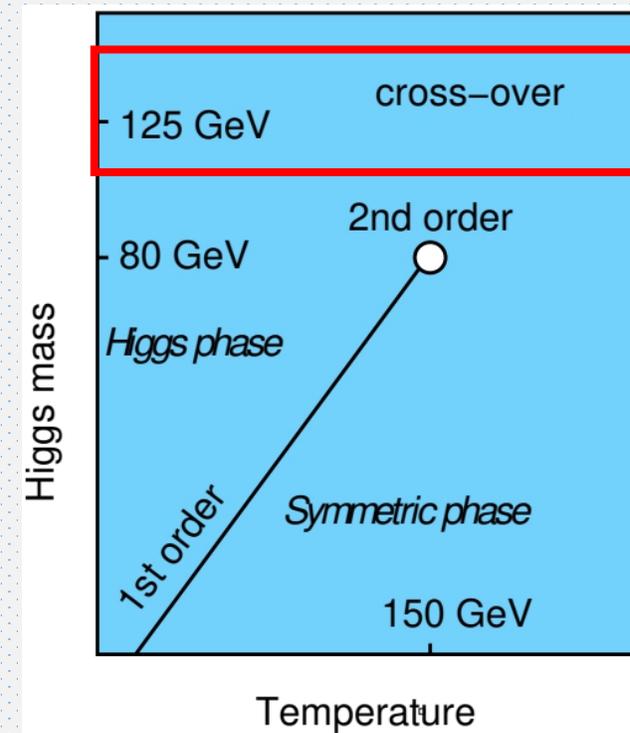

Why a different Higgs potential?

A first order EWPT can provide the non-equilibrium environment.

The SM Higgs potential with a 125 GeV Higgs gives a smooth cross-over.

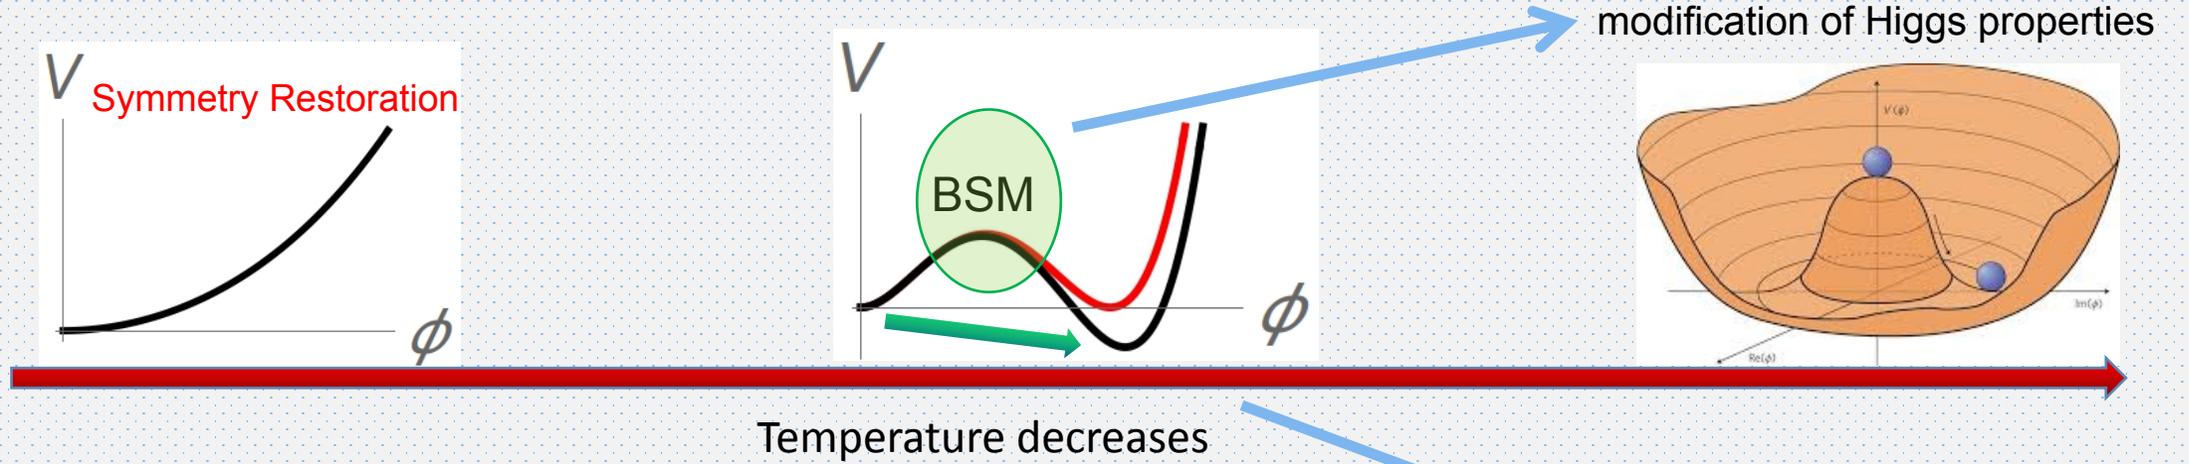

Hindmarsh, et al, 2015

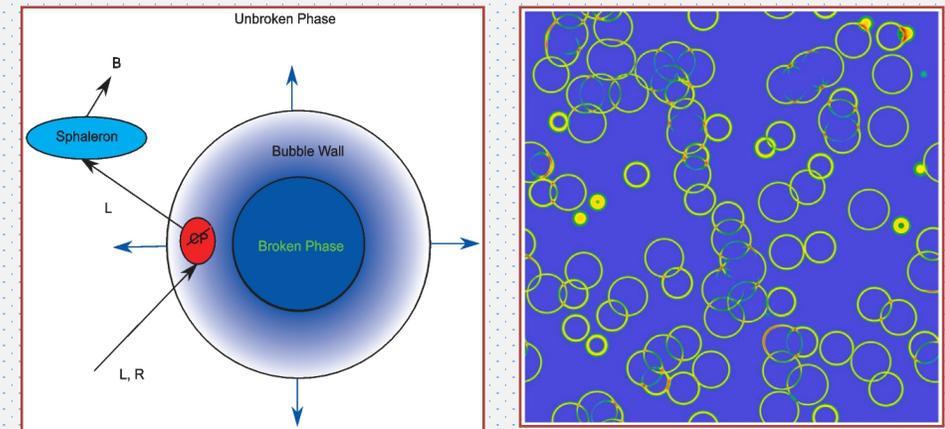

First Order Electroweak Phase Transition

How symmetry-breaking is realized in the early universe?

(For primordial black hole formation, see Kepan Xie's talk)

Hindmarsh, et al, 2015

Ghosh, Guo, Han, Liu,
JHEP 07 (2021) 045

Finite Temperature Effective Potential

Illustration with a simple potential ansatz:

$$V(\phi, T) = D(T^2 - T_0^2)\phi^2 - ET\phi^3 + \frac{\lambda}{4}\phi^4$$

The point is to generate a **barrier** between the stable and meta-stable vacua

Finite Temperature Effective Potential

At finite T, there are thermal corrections due to interactions between the scalar and the other particles.

Perturbative calculations (analytical control under high-T approximation)

$$V_T = V_{\text{tree}} + V_{\text{CW}} + \frac{T^2}{24} \sum_i c_i M_i^2(\phi) - \frac{T}{12\pi} \sum_j d_j [M_j^2(\phi)]^{3/2}$$

symmetry restoration

cubic term, barrier

Problems with the perturbative approach:

gauge-dependence (see Patel, Ramsey-Musolf, JHEP07(2011)029),
infrared-problem (Linde, Phys. Lett. B 96 (1980) 289)

non-perturbative method
(but computationally expensive)

xSM (Gould et al, PRD 100, 115024)
2HDM (Andersen et al, PRL121.191802)

How to get a barrier?

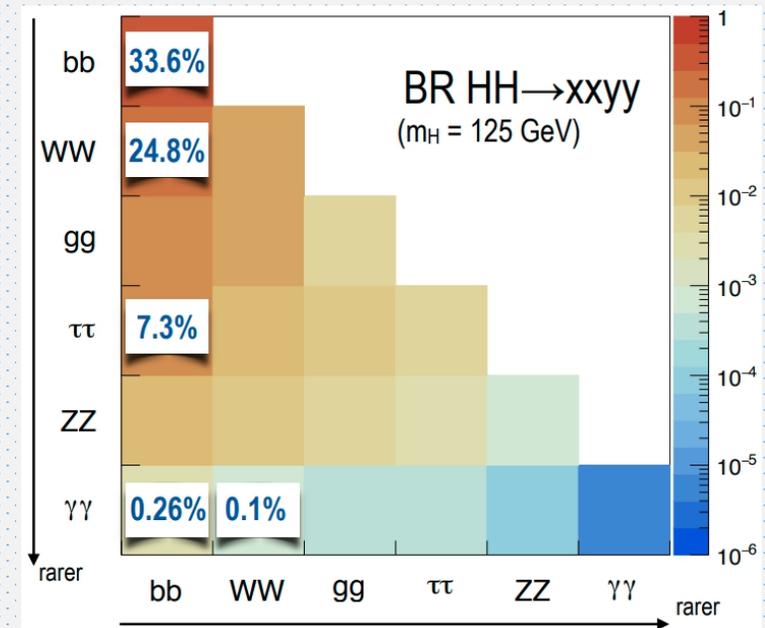

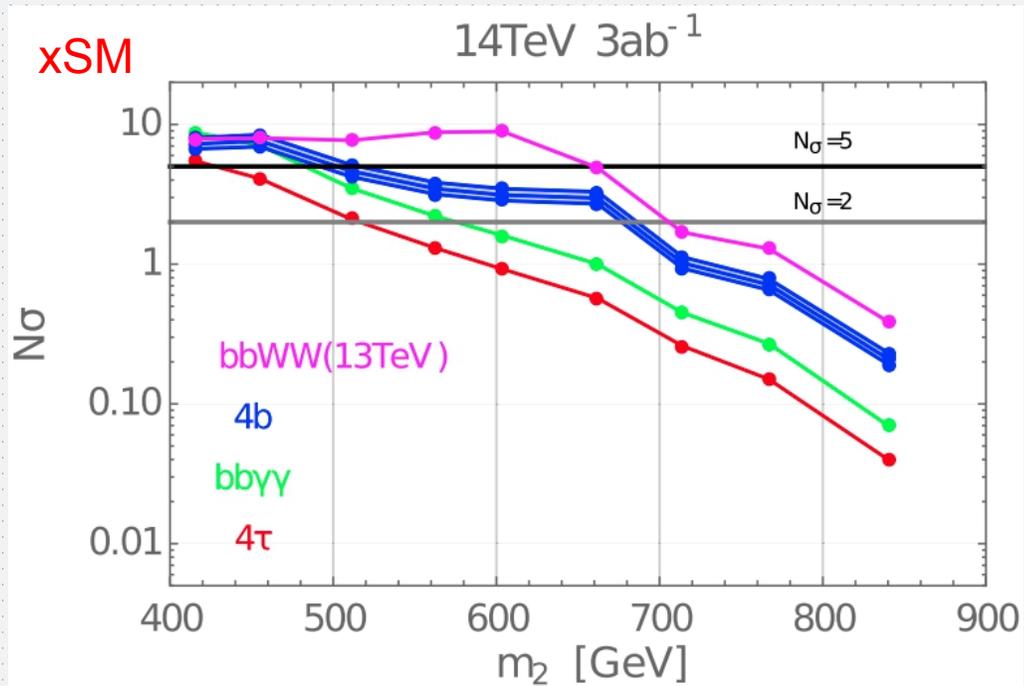

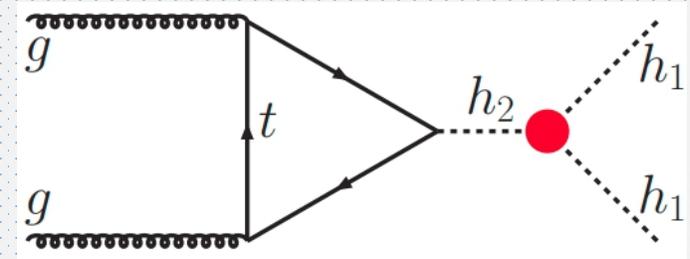

(see also Chung, Long, Wang, PRD 87 (2013) 2, 023509)

- Generating a large cubic term from thermal corrections (loop level)
- Add new scalars (tree level) (see Wei Liu, Mengchao Zhang's talks)
- Including non-renormalizable operators (tree level)

Resonant Di-Higgs Production

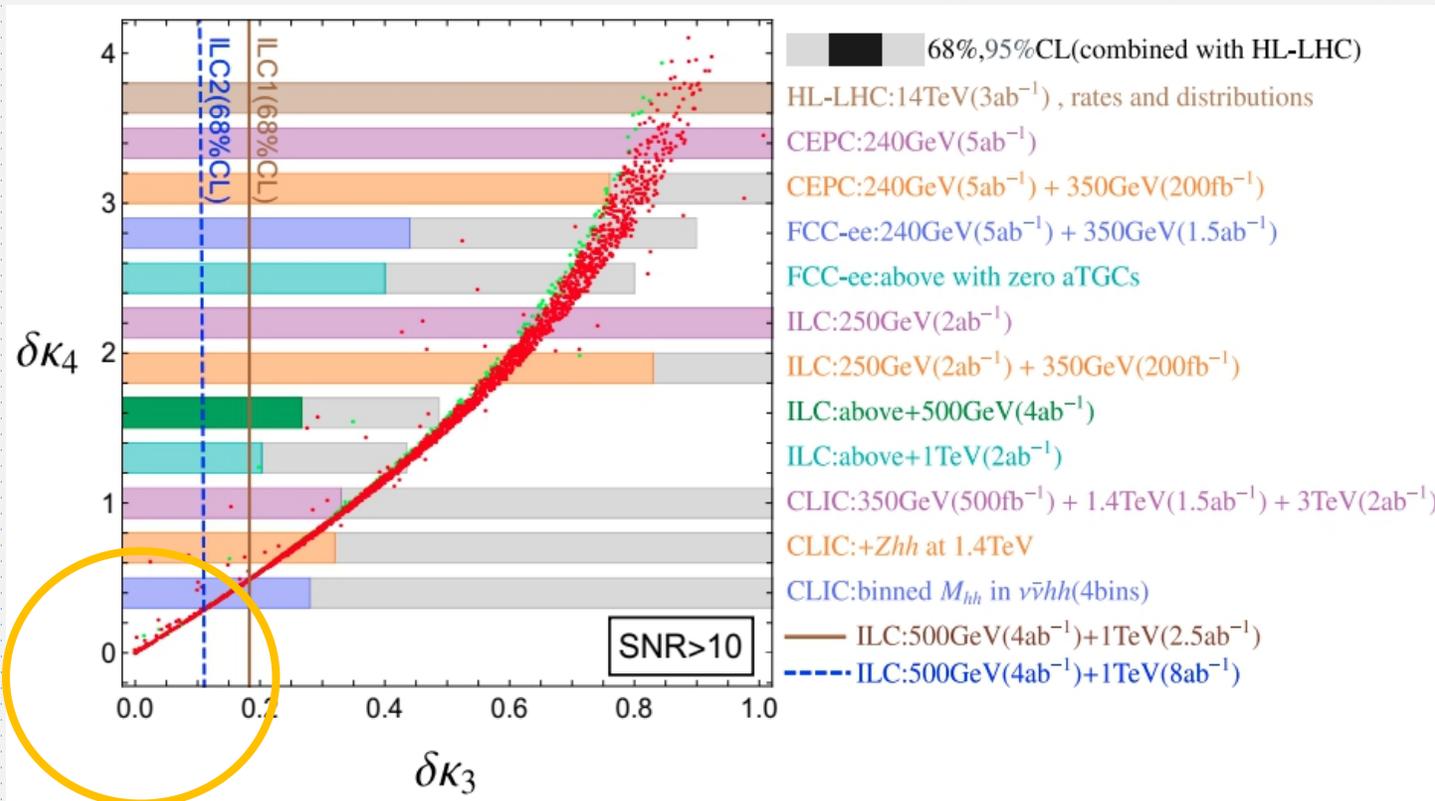

- Much easier to have vacua coexistence with multiple scalars
 - Generically leading to a **resonant** di-Higgs production
 - Correlation between EWPT and di-Higgs measurements
- Many such studies have been done.

(see also Wei Liu, Zihang Jia, Bowen zhang, Bruce Mellado's talks)

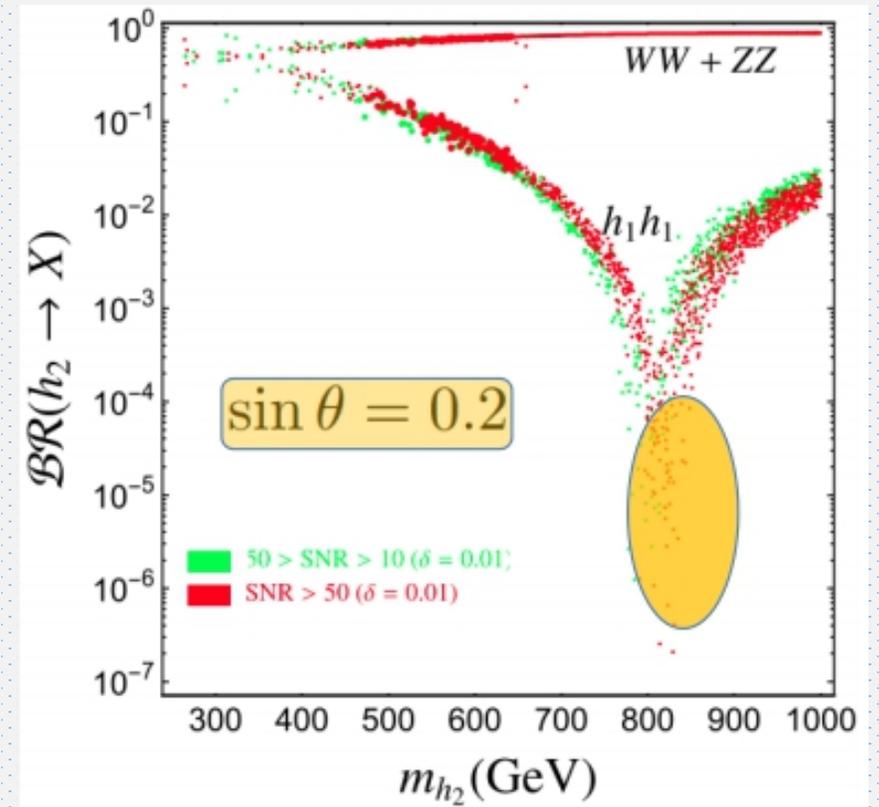

Di-Higgs Blindspot?

$$\Delta\mathcal{L} = -\frac{1}{2} \frac{m_{h_1}^2}{v} (1 + \delta\kappa_3) h_1^3 - \frac{1}{8} \frac{m_{h_1}^2}{v^2} (1 + \delta\kappa_4) h_1^4$$

Alves, Ghosh, Guo, Sinha, Vagie, JHEP04(2019)052

check for other channels (WW, ZZ)

Alves, Gonçalves, Ghosh, Guo, Sinha, Vagie, JHEP04(2019)052

Bubble Nucleations

Essentially the vacuum decay at finite temperature

- Nucleation rate

$$p = p_0 \exp \left[-\frac{S_{3,b}(T)}{T} \right]$$

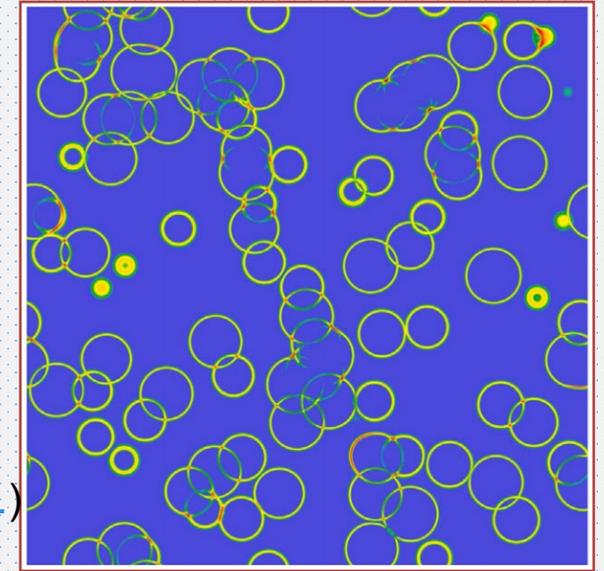

fluctuations

critical bubble: bounce solution ([CosmoTransitions](#), [AnyBubble](#), [BubbleProfiler...](#))

- Nucleation types (e.g., Hindmarsh, Hijazi JCAP12(2019)062)

exponential $p(t) = p_0 \exp \left[-S_* + \beta(t - t_*) \right]$

simultaneous $p(t) = p_0 \exp \left[-S_* - \frac{1}{2} \beta_2^2 (t - t_*)^2 \right]$

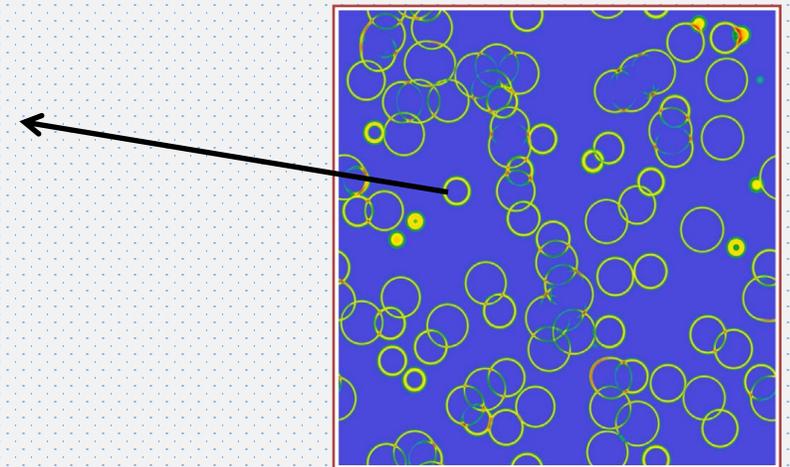

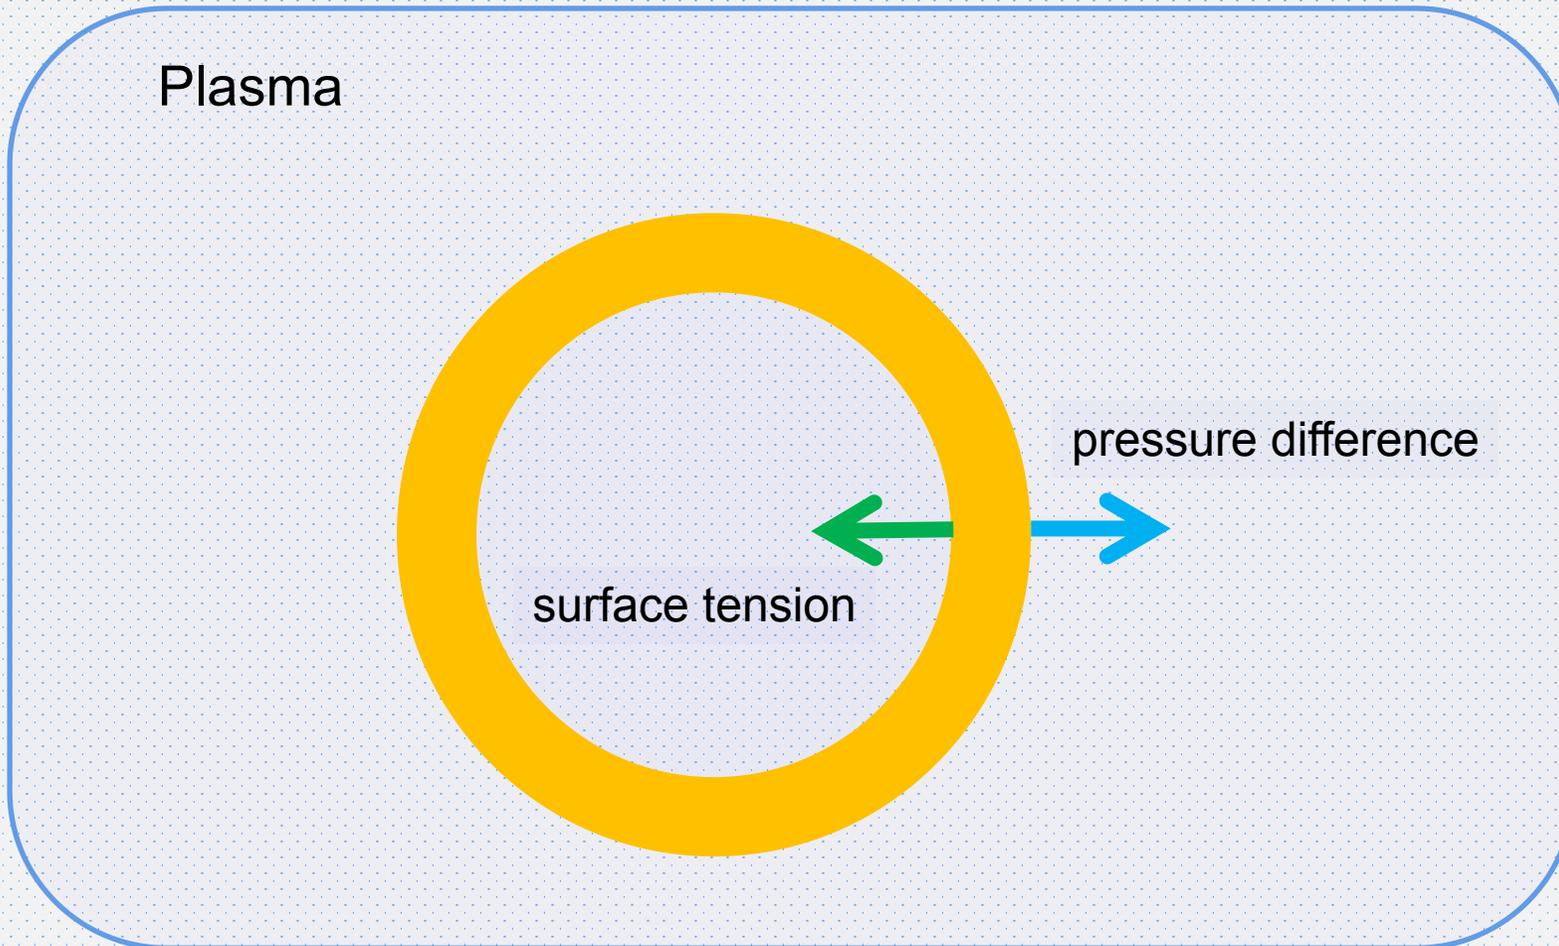

Hindmarsh, et al, 2015

Similar to the picture of boiling water

Kinetics of the Phase Transition: A Single Bubble

(see also Shaojiang Wang's talk)

Hindmarsh, et al, 2015

Magnetic field generation (see Ligong Bian's talk).

Relativistic Hydrodynamics

The fluid-scalar field model (Ignatius et al, PRD49, 3854(1994), Kurki-Suonio, Laine, PRD 54, 7163)

- Plasma: relativistic species

$$T_{\mu\nu}^{\text{plasma}} = w u_{\mu} u_{\nu} - g_{\mu\nu} p,$$

- Scalar field: ϕ

$$T_{\mu\nu}^{\phi} = \partial_{\mu}\phi\partial_{\nu}\phi - g_{\mu\nu} \left[\frac{1}{2}\partial_{\rho}\phi\partial^{\rho}\phi - V_0(\phi) \right]$$

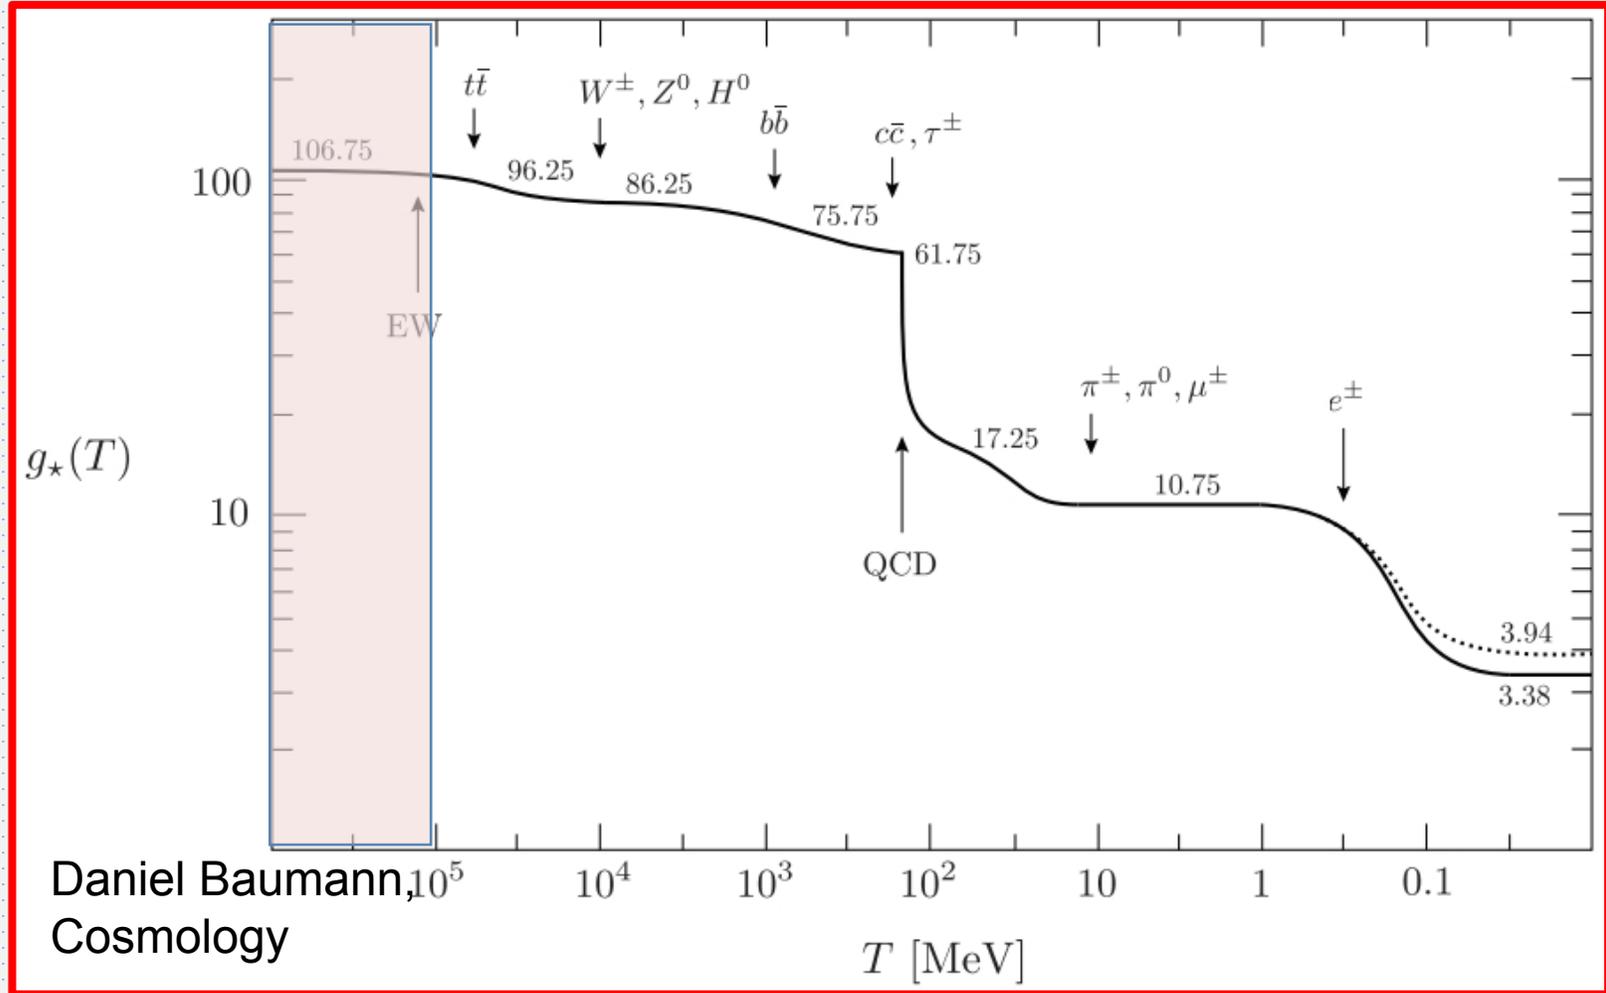

Equations of motion (numerical simulations, theoretical modellings, gravitational waves, etc)

1. The total energy and momentum are conserved, not separately (friction).
2. Metric evolution governed by Einstein equation, coupled with matter equations.

Relativistic Hydrodynamics

● Plasma: relativistic species →

● Scalar field: ϕ

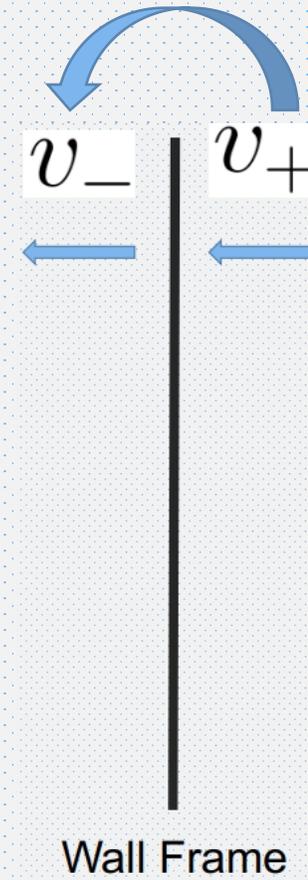

The Bag Model

- Plasma: relativistic species

- Scalar field: ϕ

$$p_- = \frac{1}{3} a_- T_-^4, \quad e_- = a_- T_-^4$$

$$p_+ = \frac{1}{3} a_+ T_+^4 - \epsilon, \quad e_+ = a_+ T_+^4 + \epsilon$$

bag constant

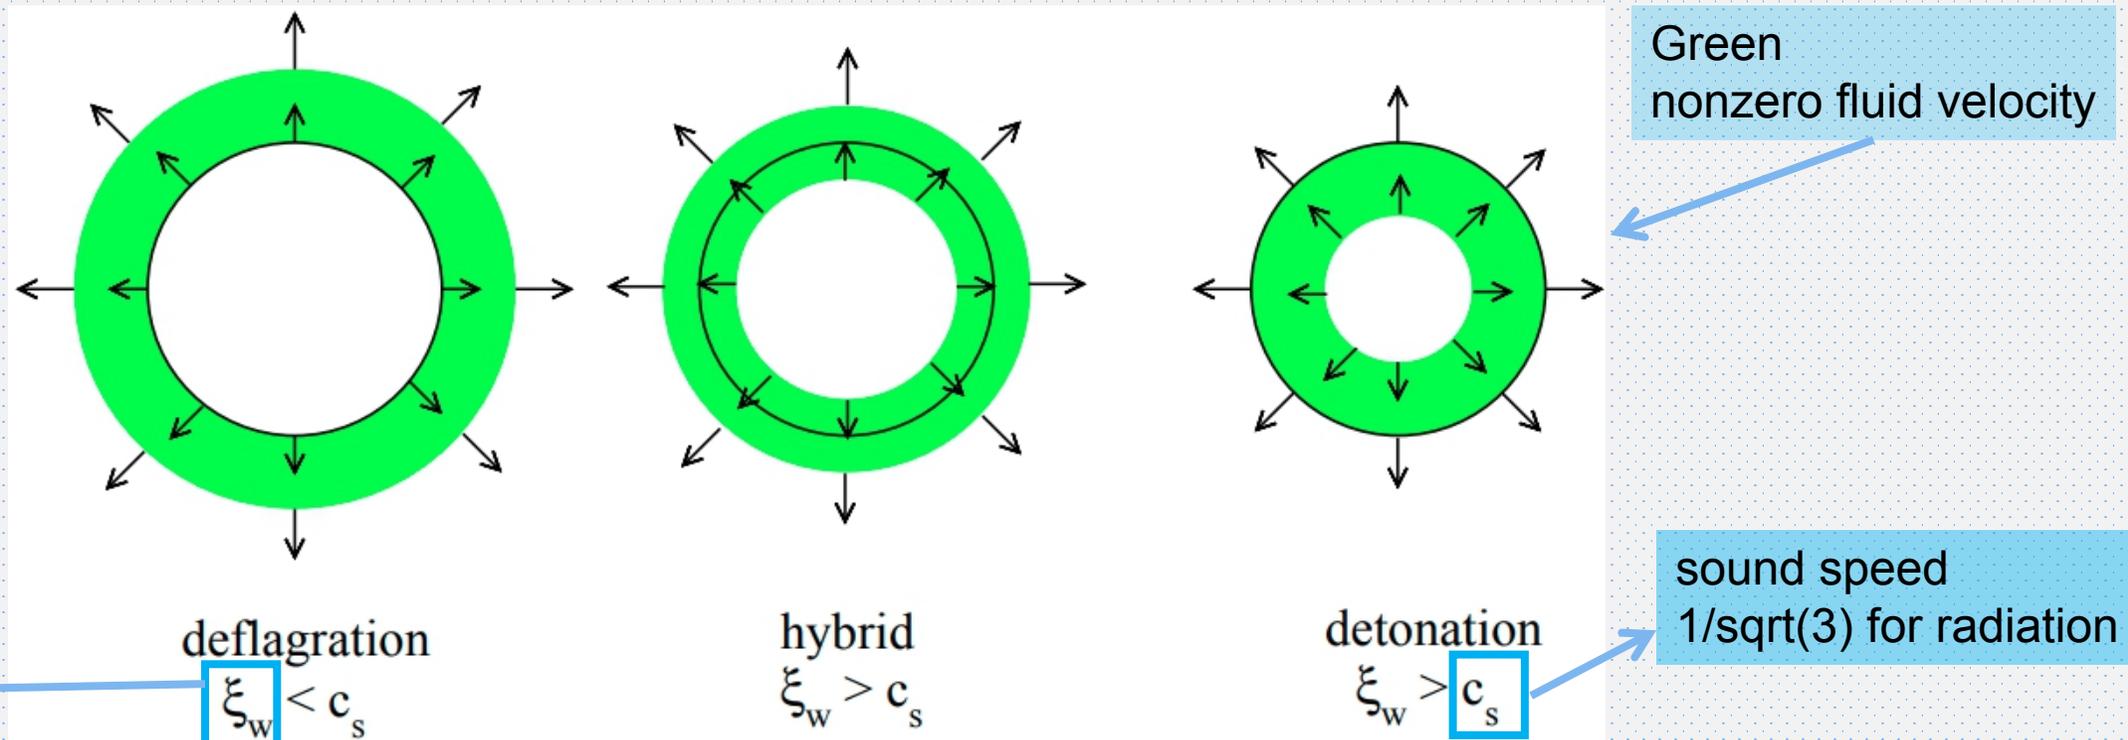

Beyond the bag model

Wang, Huang, Zhang, PRD103, 103520.
Giese, Konstandin, Vis, JCAP07(2020)057

see Xiao Wang's talk

Relativistic Combustion

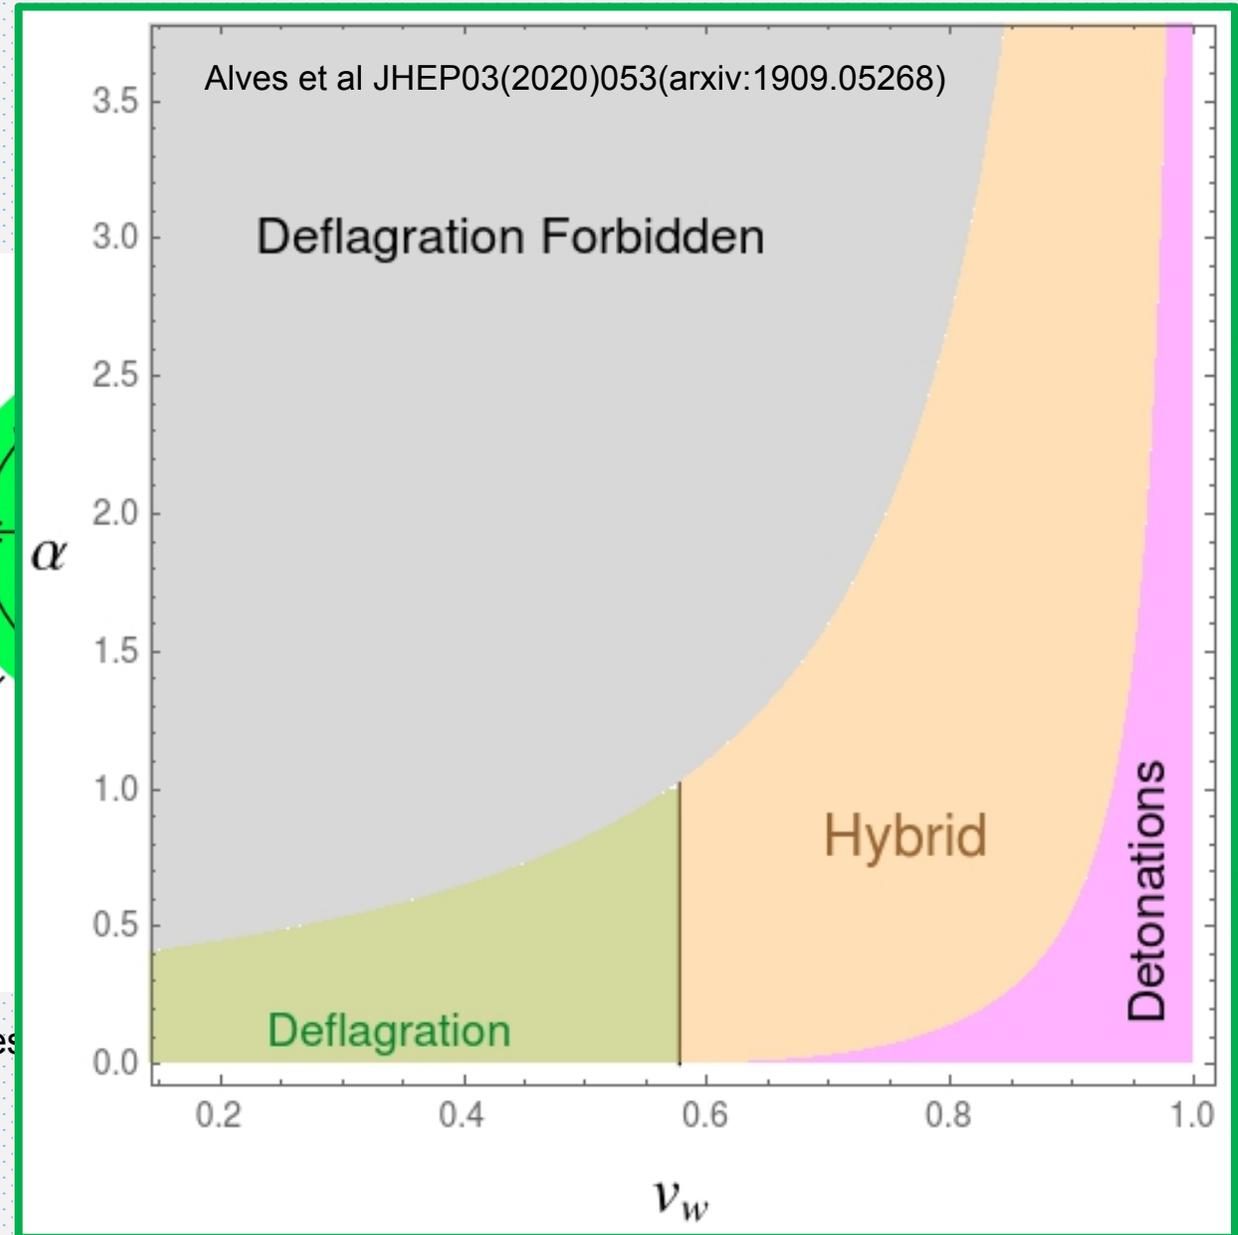

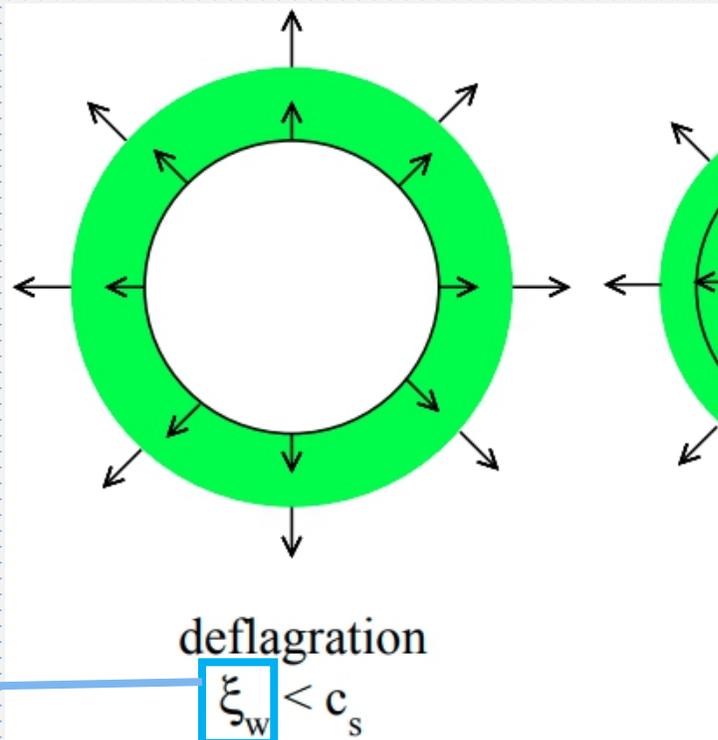

The fluid motion admits 3 modes:

Recent summary of all modes: JCAP06(2010)028 (arxiv: 1004.4187)

Relativistic Combustion

The fluid motion admits 3 modes:

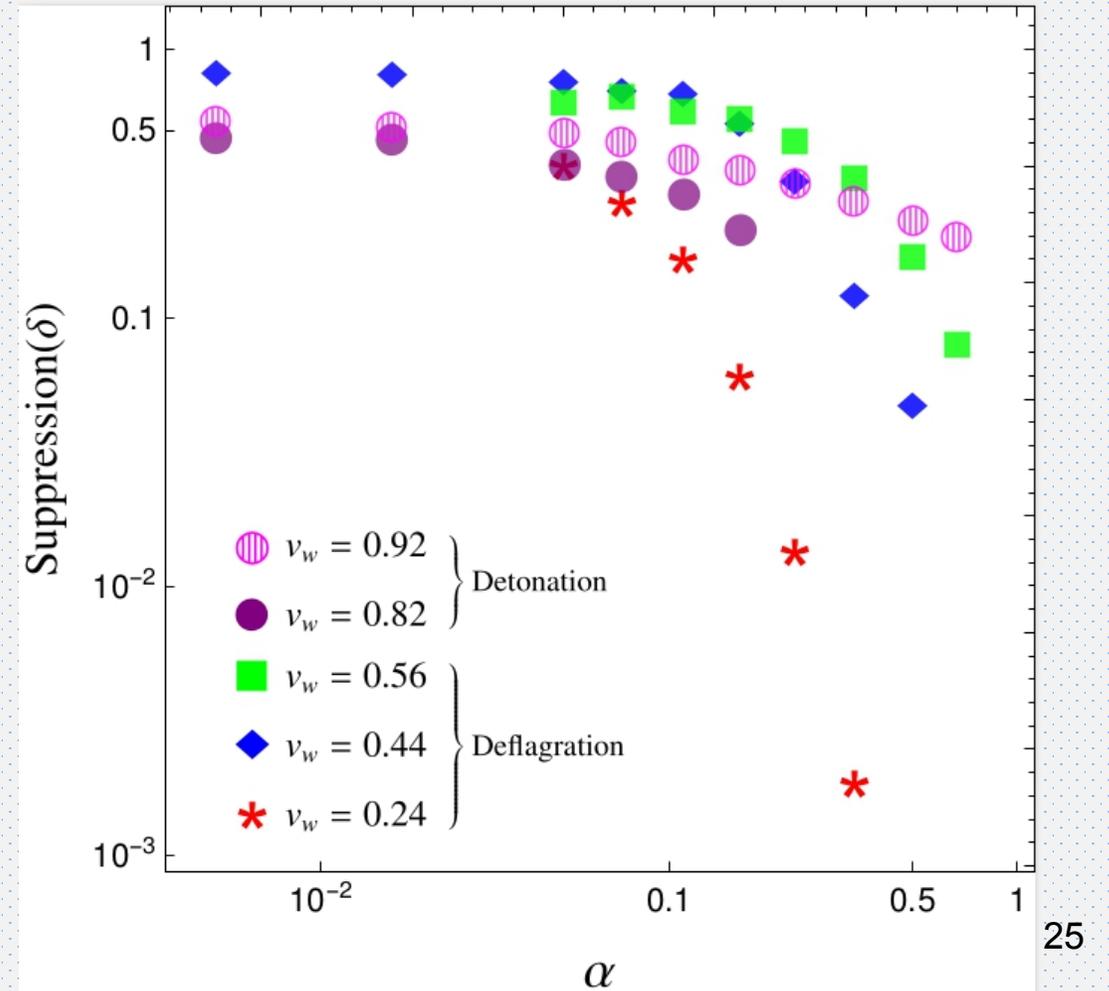

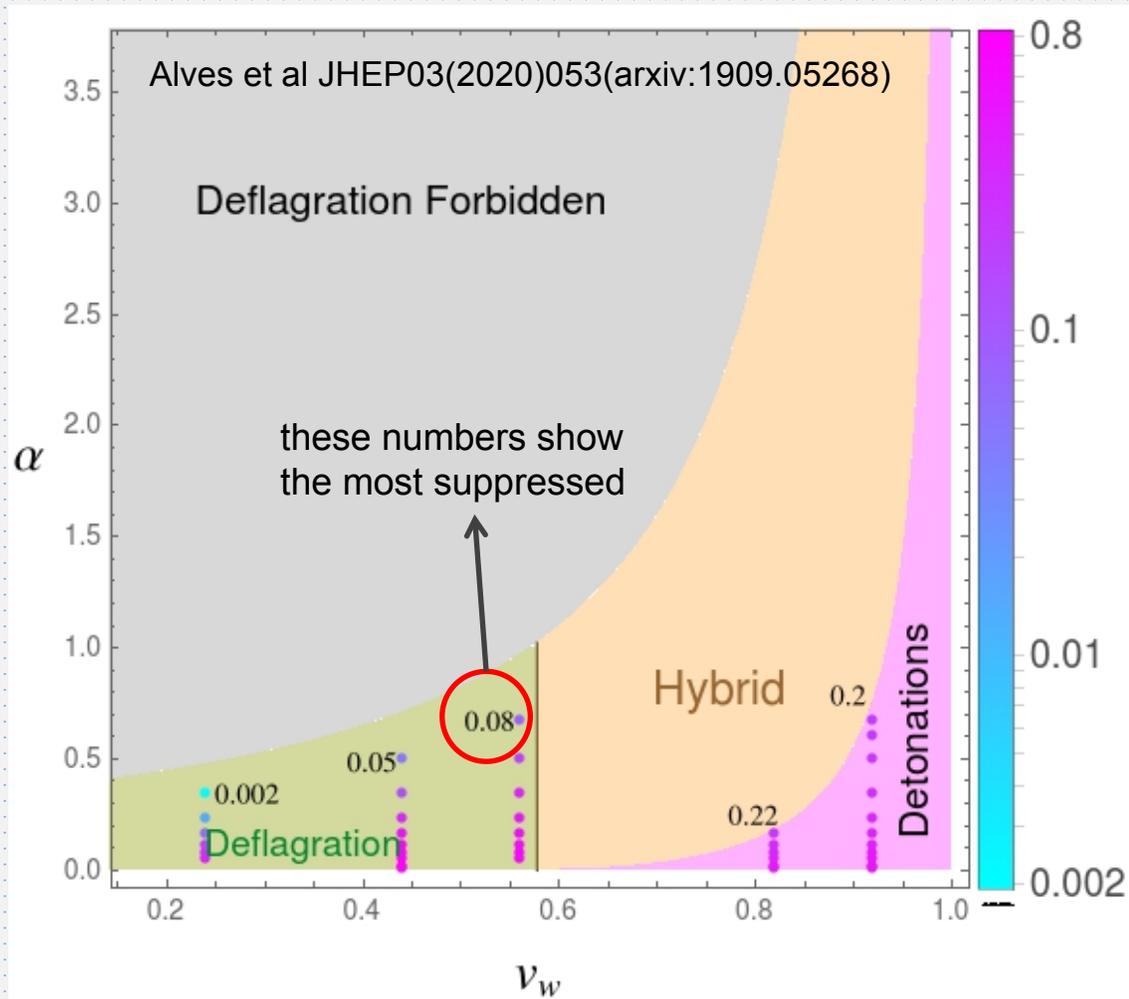

velocity

adiation

New Phenomena in Simulations

Reduction of GW from sound waves [Cuttings, et al, Phys.Rev.Lett. 125 \(2020\) 2, 021302](#)
mostly for deflagrations, hybrid not available, detonation less affected

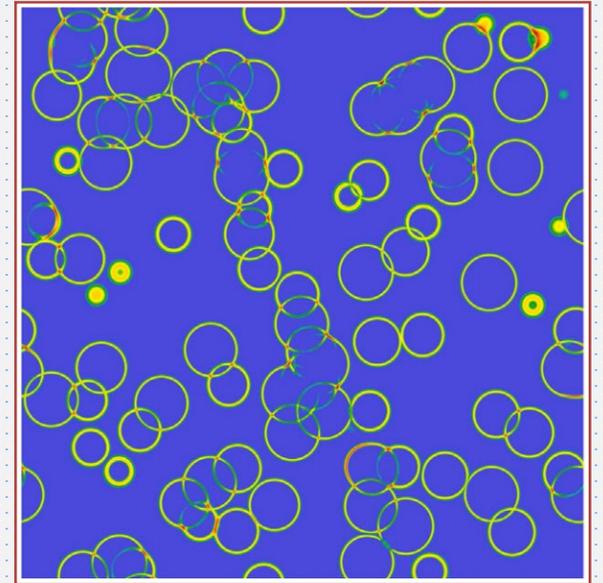

Quantifying the Properties of the Bubbles

A quantitative understanding of the phase transition process.

(Hindmarsh, Hijazi, JCAP12(2019)062, Guo, Sinha, Vagie, White, JCAP01(2021)001)

- Bubble Nucleation Rate
- False Vacuum Fraction
- Unbroken Wall Area
- Bubble Lifetime Distribution
- Bubble Number Density and Mean Bubble Separation(R^*)

Hindmarsh, et al, 2015

These are needed for calculating observables of the transition.

Gravitational Waves

$$ds^2 = -dt^2 + a^2(\delta_{ij} + h_{ij}(\mathbf{x}))d\mathbf{x}^2$$

Tensor Mode

$$\langle \dot{h}_{ij}(t, \mathbf{q}) \dot{h}_{ij}(t, \mathbf{k}) \rangle = (2\pi)^{-3} \delta^3(\mathbf{k} + \mathbf{q}) P_h(k, t)$$

$$\frac{d\rho_{\text{GW}}(t)}{d \ln k} = \frac{1}{64\pi^3 G} k^3 P_h(t, k)$$

GW Spectrum

Einstein equation

$$h_q'' + 2\frac{a'}{a}h_q' + q^2 h_q = 16\pi G a^2 \pi_q^T$$

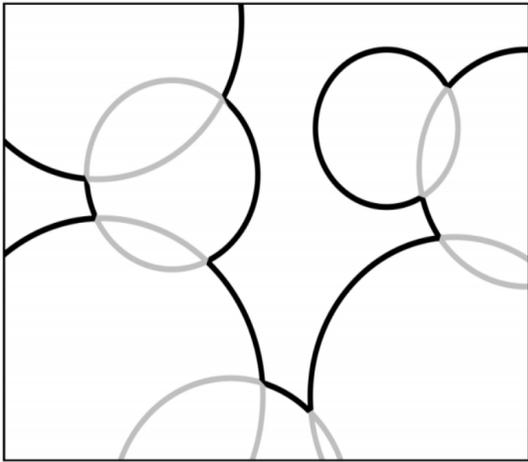

Source evolutions

Plasma(relativistic species), Matter(non-relativistic), Scalar field, EM
Energy-momentum conservation (hydrodynamic limit)

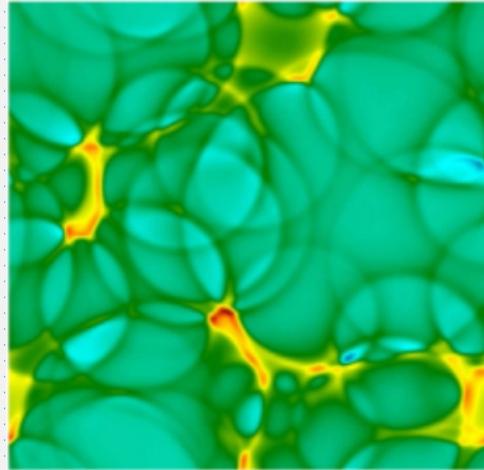

Sources for Gravitational Wave Production

The current understanding:

Bubble Collisions

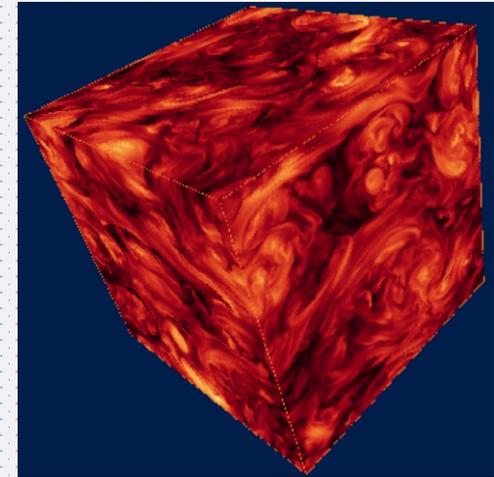

Sound Waves

Hindmarsh, et al, PRL 112, 041301 (2013)

MagnetoHydrodynamic Turbulence

Bubble Collisions

Envelope Approximation

Simulations:

Kosowsky, Turner, Watkins, Kamionkowski, PRL69,2026(1992), PRD45,4514(1992), PRD47,4372(1993), PRD49,2837(1994), Huber, Konstandin, JCAP09(2008)022

Analytical Modelling:

Jinno, Takimoto, PRD95,024009(2017)

Beyond the Envelope Approximation

Bulk flow model: Konstandin, JCAP03(2018)047, Jinno, Takimoto, JCAP01(2019)060

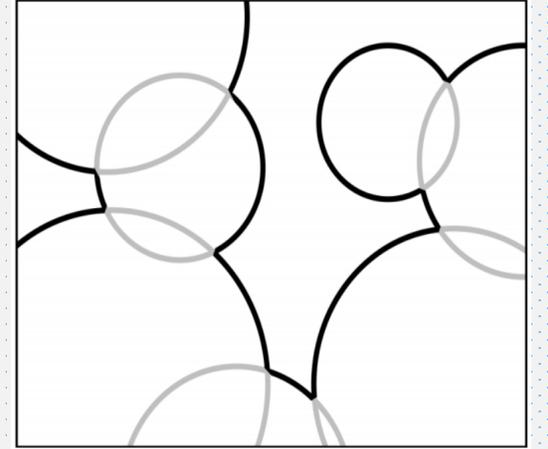

Direct large scalar lattice simulations: Cutting, Escartin, Hindmarsh, Weir, PRD97,123513(2018), arXiv:2005.13537

Expanding Universe: Zhong, Gong, Qiu, arxiv:2107.01845

New Phenomena

Di, Wang, Zhou, Bian, Cai, Liu, Phys.Rev.Lett. 126 (2021) 25, 251102

Lewicki, Vaskonen, EPJC 80,1003(2020)

negligible (dominant) when
other sources are present (absent)

$$\Omega_{\text{coll}}(f)h^2 = 1.67 \times 10^{-5} \Delta \left(\frac{H_{\text{pt}}}{\beta} \right)^2 \left(\frac{\kappa_{\phi} \alpha}{1 + \alpha} \right)^2 \times \left(\frac{100}{g_*} \right)^{1/3} S_{\text{env}}(f),$$

$$f_{\text{env}} = 16.5 \left(\frac{f_{\text{bc}}}{\beta} \right) \left(\frac{\beta}{H_{\text{pt}}} \right) \left(\frac{T_{\text{pt}}}{100 \text{ GeV}} \right) \left(\frac{g_*}{100} \right)^{1/6} \mu\text{Hz},$$

Sound Waves

Numerical Simulations:

Hindmarsh, Huber, Rummukainen, Weir,
PRL112, 041301 (2014), PRD92, 123009 (2015), PRD96, 103520 (2017)

Analytical Modelling(sound shell model)

Minkowski: Hindmarsh, 120, 071301 (2018)
Hindmarsh, Hijazi, JCAP12(2019)062
FLRW: **HG**,Sinha,Vagie,White,JCAP 01 (2021) 001

- Solve the fluid velocity profile
modes: detonation, deflagration, hybrid
Espinosa, Konstandin, No, Servant (JCAP06,028)
- Reduction found for $\alpha \sim 1$ and small v_w
Cutting, Hindmarsh, Weir, PRL125, 021302 (2020)

$$\Omega_{\text{sw}}(f)h^2 = 2.65 \times 10^{-6} \left(\frac{H_{\text{pt}}}{\beta}\right) \left(\frac{\kappa_{\text{sw}}\alpha}{1+\alpha}\right)^2 \left(\frac{100}{g_*}\right)^{1/3} \\ \times v_w \left(\frac{f}{f_{\text{sw}}}\right)^3 \left(\frac{7}{4+3(f/f_{\text{sw}})^2}\right)^{7/2} \Upsilon(\tau_{\text{sw}}),$$

The **dominant** source for a FOPT in a thermal plasma.

$$\Upsilon = 1 - (1 + 2\tau_{\text{sw}}H_{\text{pt}})^{-1/2} \quad (\text{RD})$$

HG,Sinha,Vagie,White,JCAP 01 (2021) 001

Previous formula mistakenly enforces an infinite lifetime.

Magnetohydrodynamic Turbulence

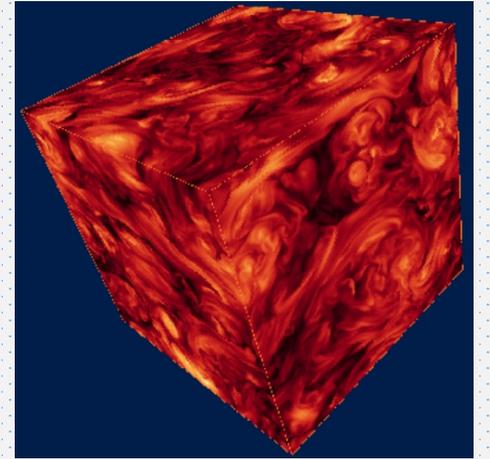

Analytical Modelling

Kolmogorov spectrum:

Kosowsky, Mack, Kahniashvili, PRD66,024030(2002)

Gogoberidze, Kahniashvili, Kosowsky, PRD76,083002(2007)

Caprini, Durrer, Servant, JCAP12(2009)024

<https://home.mpcdf.mpg.de/~wcm/projects/homog-mhd/mhd.html>

5%~10% but uncertain

$$h^2 \Omega_{\text{turb}}(f) = 3.35 \times 10^{-4} \left(\frac{H_*}{\beta} \right) \left(\frac{\kappa_{\text{turb}} \alpha}{1 + \alpha} \right)^{\frac{3}{2}} \left(\frac{100}{g_*} \right)^{1/3} v_w S_{\text{turb}}(f)$$

Caprini, Durrer, Servant, JCAP12(2009)024 (adopted by the LISA Cosmology Working group, JCAP04(2016)001)

$$S_{\text{turb}}(f) = \frac{(f/f_{\text{turb}})^3}{[1 + (f/f_{\text{turb}})]^{\frac{11}{3}} (1 + 8\pi f/h_*)}$$

$$h_* = 16.5 \times 10^{-3} \text{ mHz} \left(\frac{T_*}{100 \text{ GeV}} \right) \left(\frac{g_*}{100} \right)^{\frac{1}{6}}$$

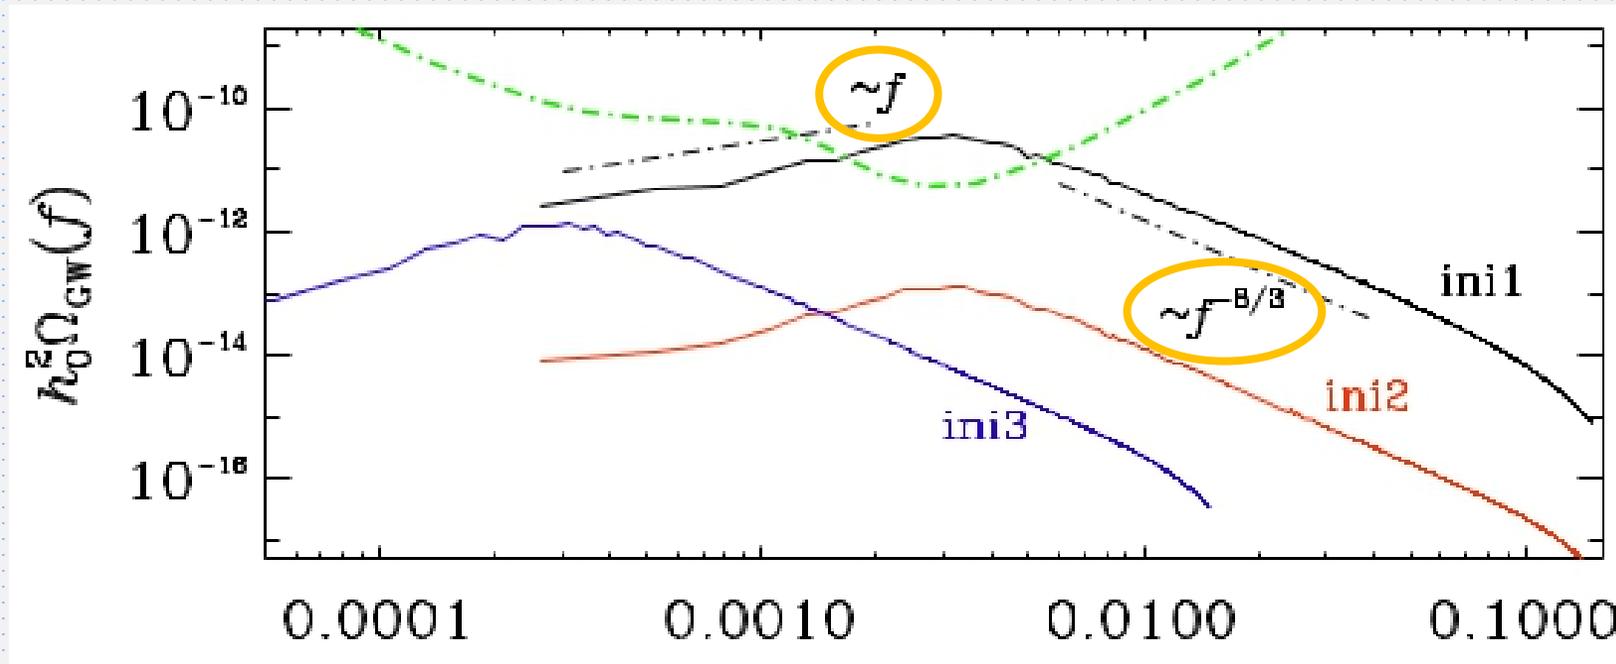

$$f_{\text{turb}} = 2.7 \times 10^{-2} \text{ mHz} \frac{1}{v_w} \left(\frac{\beta}{H_*} \right) \left(\frac{T_*}{100 \text{ GeV}} \right) \left(\frac{g_*}{100} \right)^{\frac{1}{6}}$$

Magnetohydrodynamic Turbulence

Numerical Simulations

Pol, Mandal, Brandenburg, Kahniashvili, Kosowsky, PRD 102, 083512 (2020) (arxiv:1903.08585)

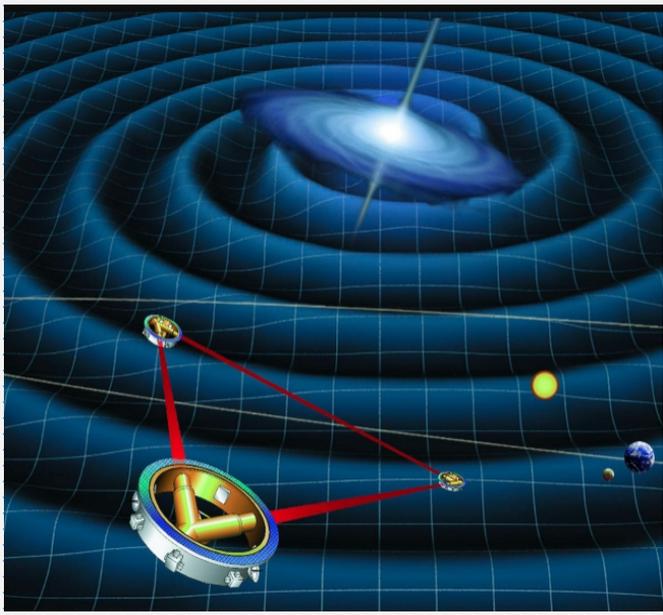

- Result significantly different from spectrum in previous slide
- Result significantly dependent on initial conditions

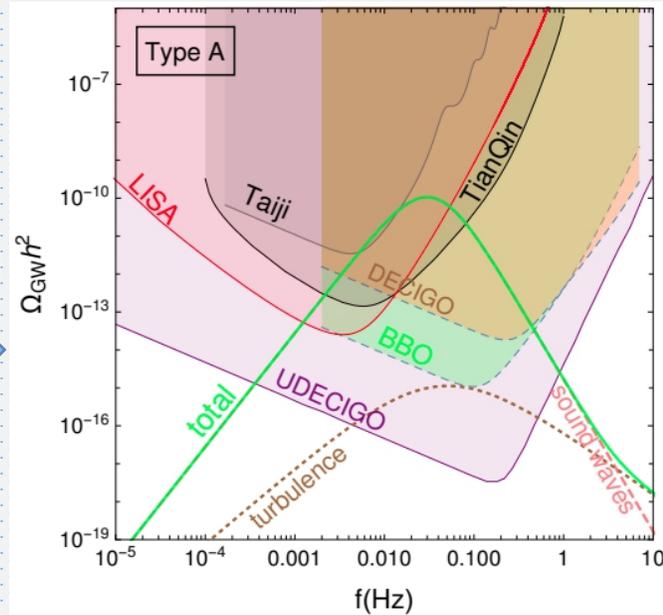

Pol et al, PRD 102, 083512 (2020)

Many Colliders in the Horizon

The Road Ahead

2018@Fermilab

Summary

- The Higgs potential remains largely unconstrained in the near future.
- A first order EWPT is well motivated and realized in many new physics models.
- Gravitational waves from a first order EWPT can help reconstruct the Higgs potential

Thanks!
