STAR重离子碰撞实验集体流的研究进展

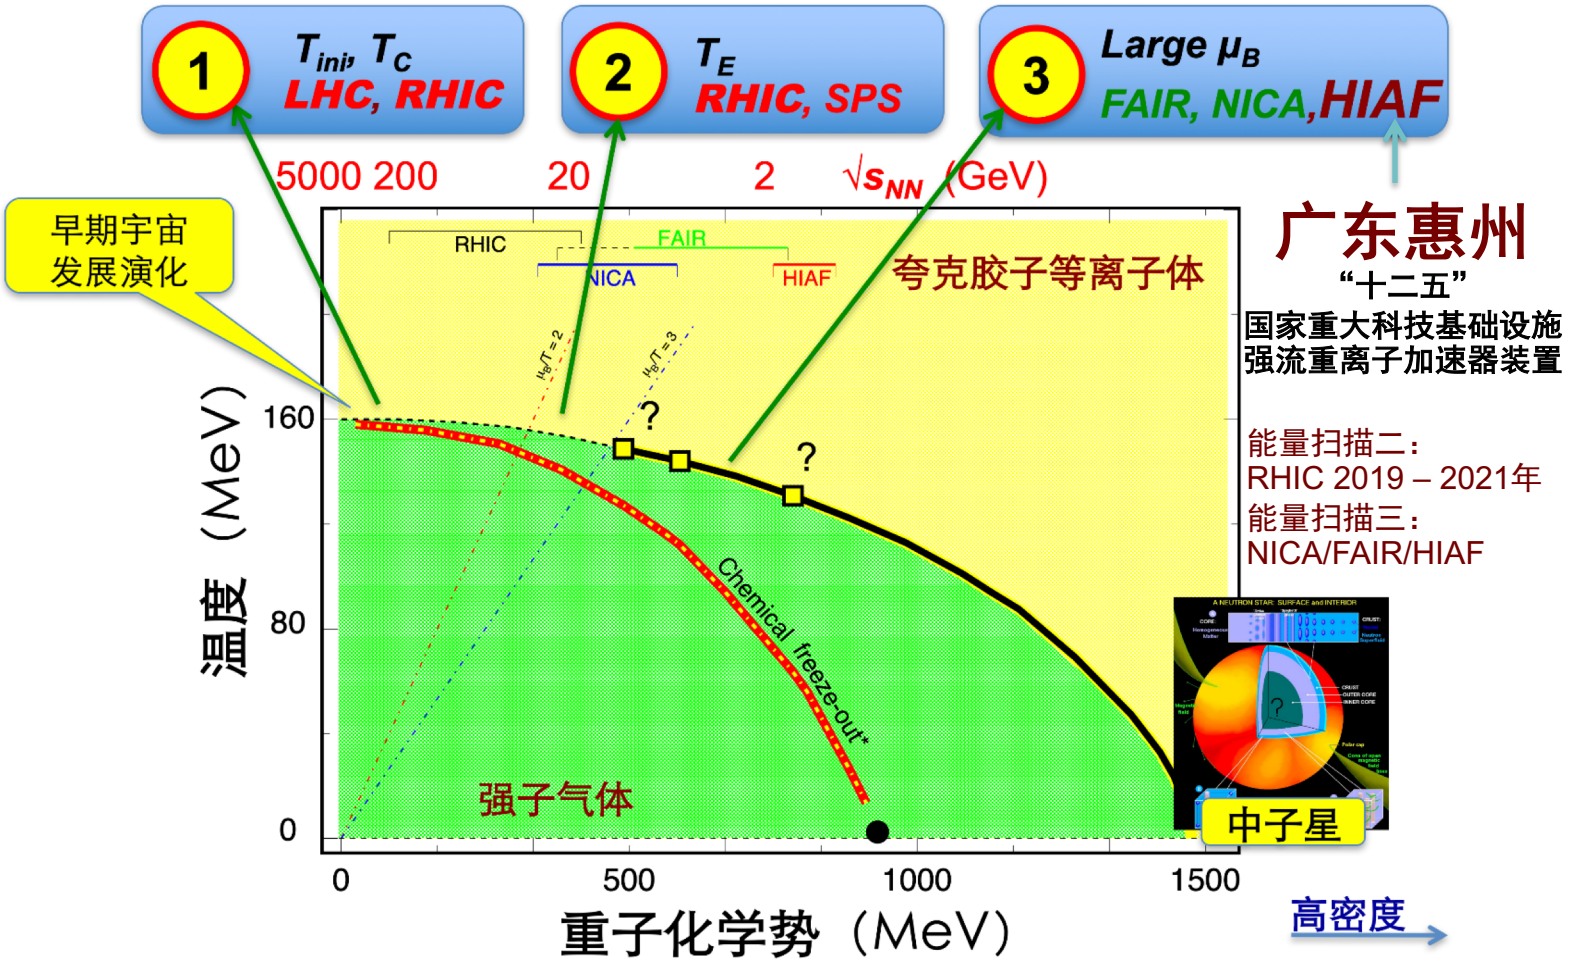
施梳苏

华中师范大学

Outline

- Introduction
- Beam Energy Scan
- Results and Discussions
- Summary and Outlook

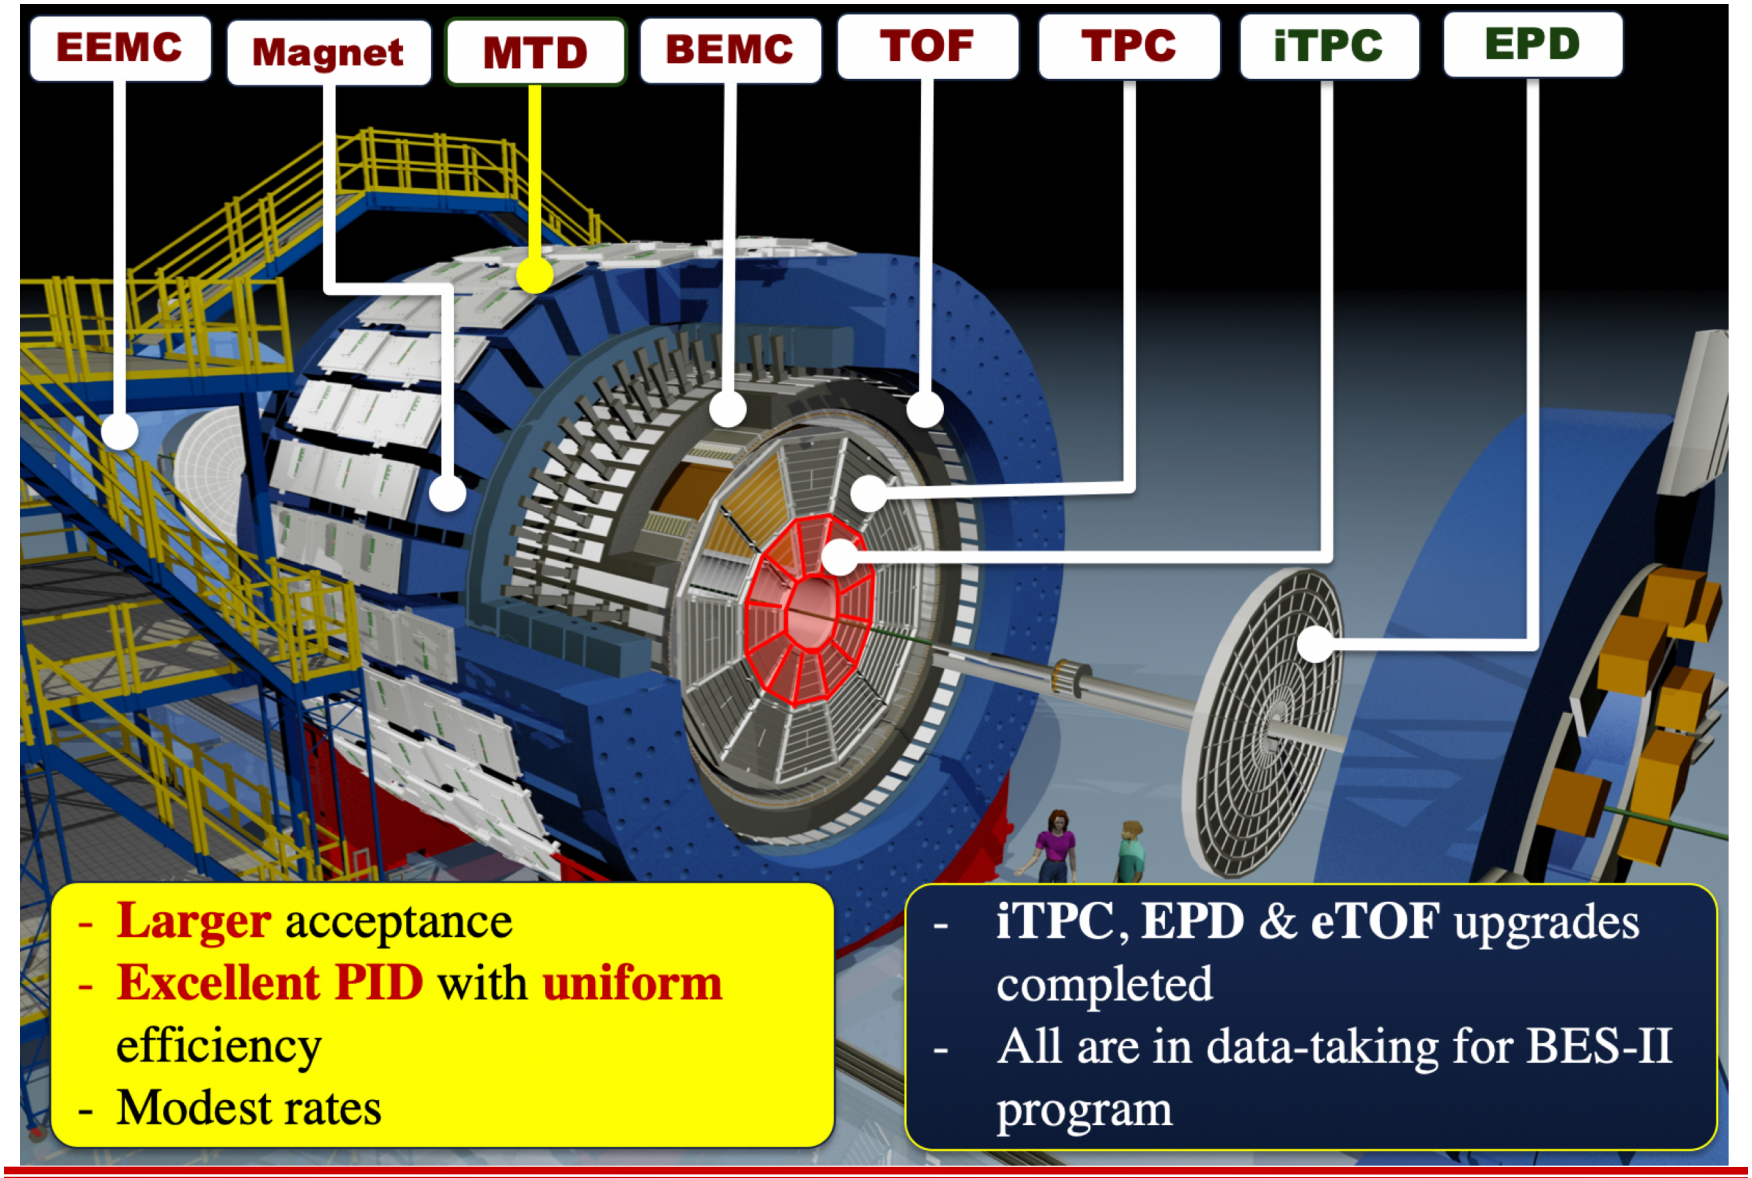
QCD Phase Diagram



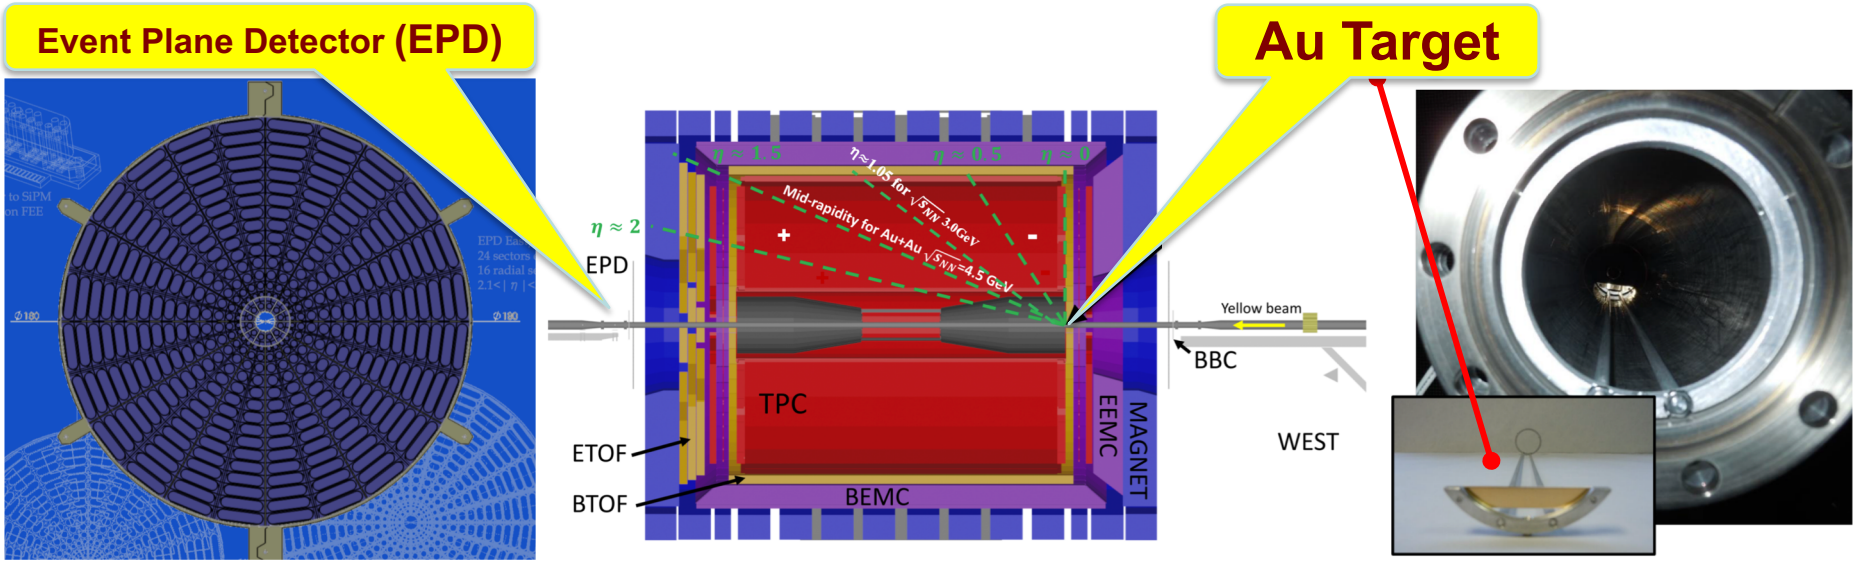
强相互作用相结构的实验研究

- 低重子密度区（高能）：**夸克物质的性质**
- 高重子密度区（能量扫描）：**相边界，临界点**

STAR Detectors



STAR Fixed Target Setup



- **Good mid-rapidity coverage for FXT 3 GeV collisions**

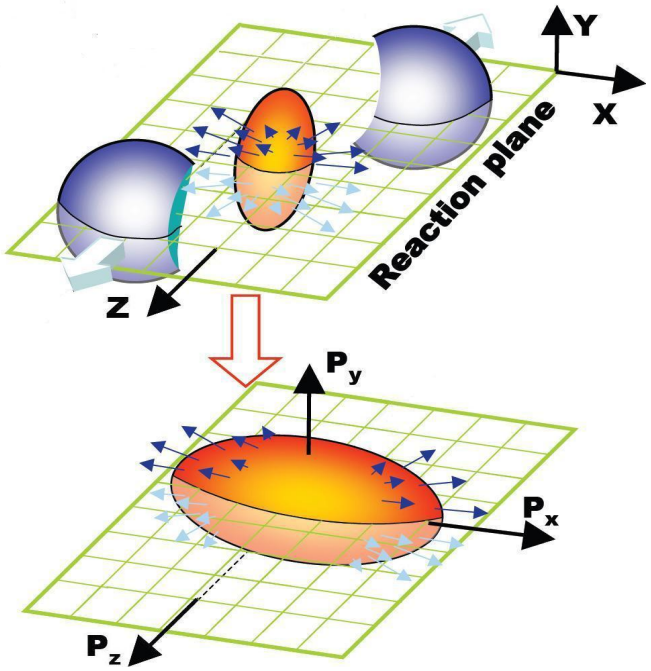
Beam Energy Scan

BES-II data taking has been finished

$\sqrt{s_{NN}}$(GeV)	μ_B(MeV)	Events	Date collected
19.6	206	478 M	2019
14.6	262	324 M	2019
11.5	316	235 M	2020
9.2	373	162 M	2020
7.7	422	101M+163 M	2021
6.2	487	118 M	2020
5.2	541	103 M	2020
4.5	589	108 M	2020
3.9	632	170 M	2020
3.5	666	116 M	2020
3.2	697	201 M	2019
3.0	721	2361 M	2021

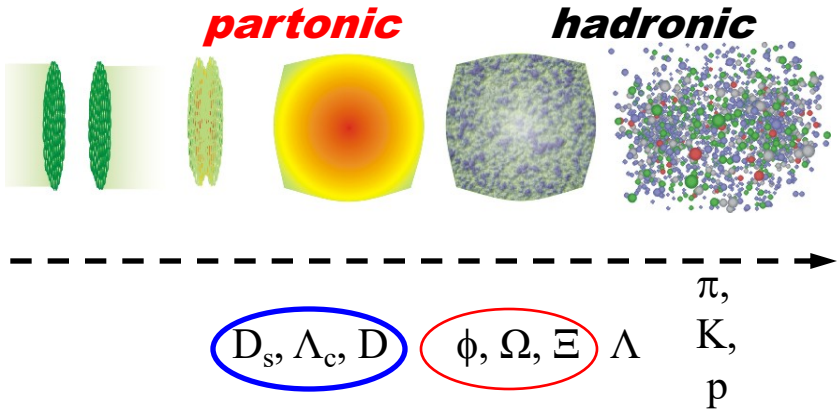
- Higher statistics, better detector performance and more energy points in BES-II
- Explore the QCD phase diagram and constrain the EoS at high baryon density

Anisotropic Flow



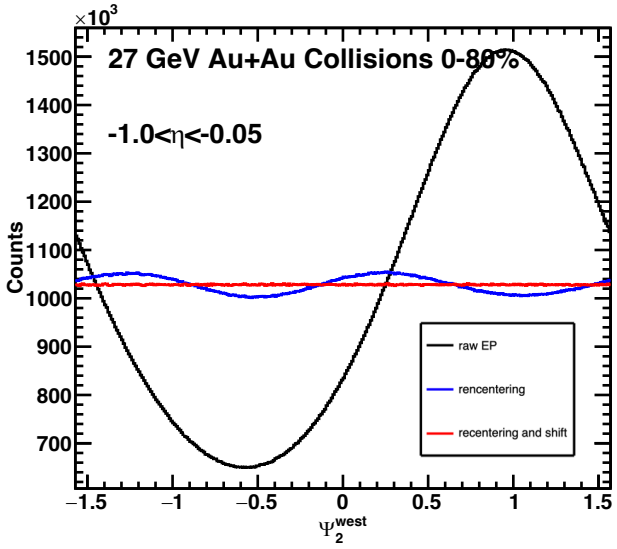
$$\frac{dN}{d\phi} \propto 1 + 2\sum_{n=1} v_n \cos\left[n(\phi - \Psi_n)\right]$$

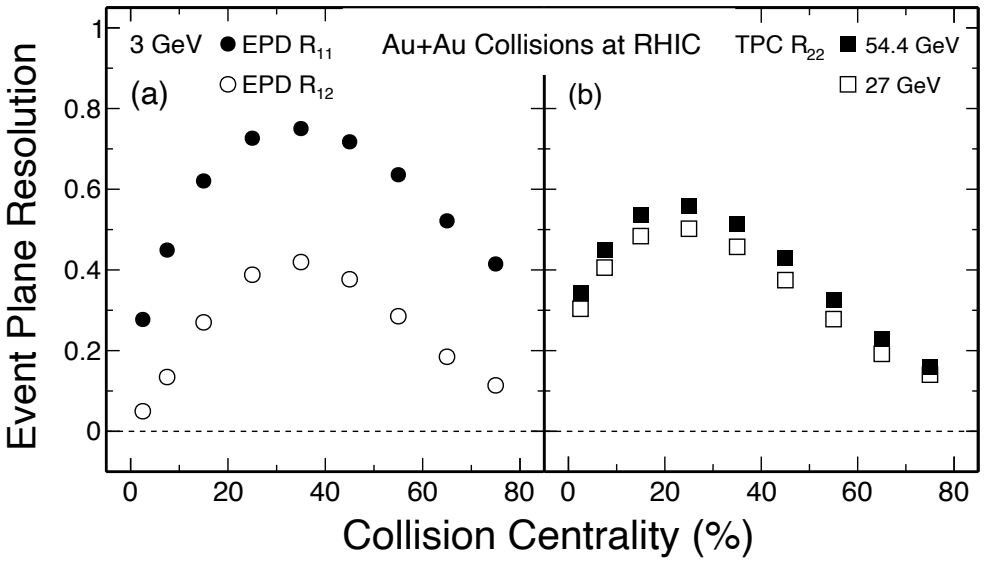
v_1: directed flow; v_2: elliptic flow;
v_3: triangular flow; v_4 .....



- **Anisotropic flow**:
  Sensitive to the early stage of the collision
- **Heavy flavor flow**
  Study medium properties from motion of heavy quarks in medium
- **Multi-strange hadrons and ϕ meson**:
  Less sensitive to late hadronic rescatterings

Event Plane Reconstruction

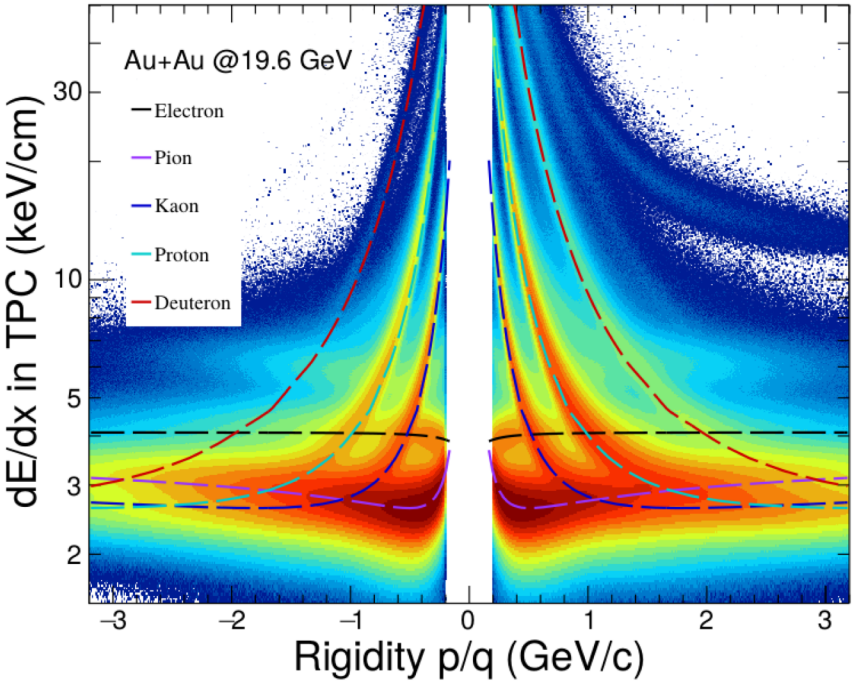


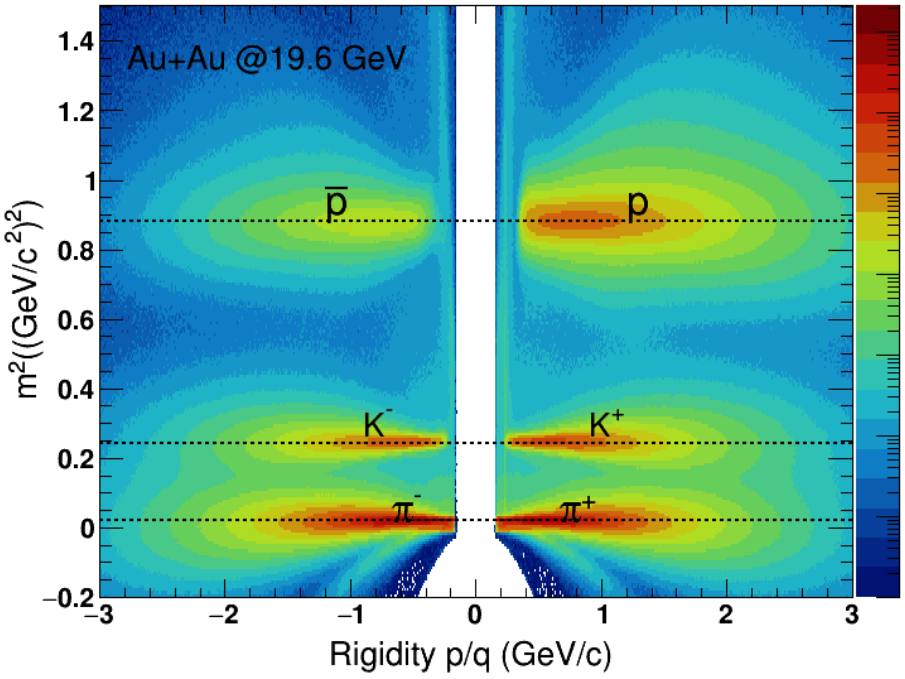


A. M. Poskanzer and S. A. Voloshin, Phys. Rev. C 58, 1671 (1998).

- TPC 2nd order event plane
  - EP resolution (R_{22}) is calculated by two sub-event method
- The 1st order event plane from east side EPD at 3 GeV
  - The 1st order EP resolution (R_{11}) is calculated by three sub-event method
  - R_{12} is for v_2 measurement

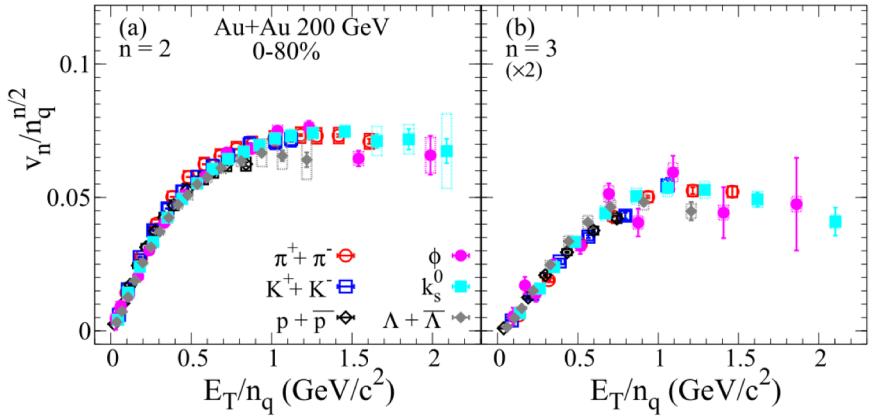
Particle Identification

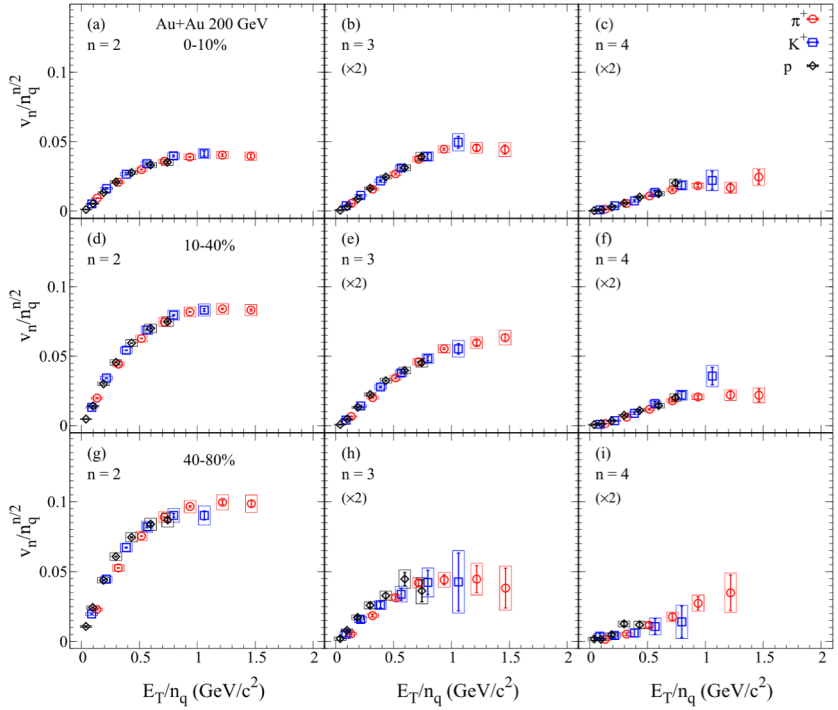




- Good capability of particle identification based on TPC and TOF

Higher-order Flow in 200 GeV





RHIC top energy

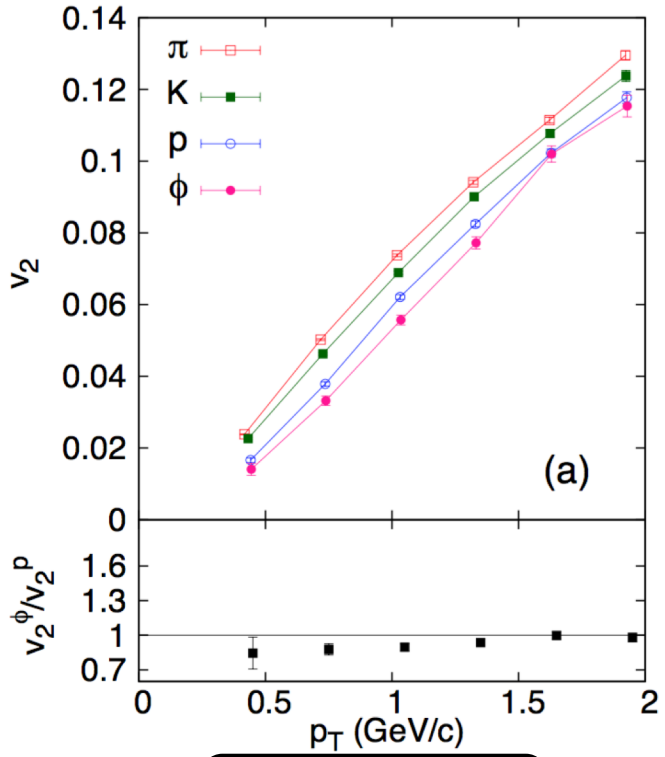
- Light flavor, strange particles and φ mesons
- Follow the NCQ scaling up to v_4

Partonic collectivity

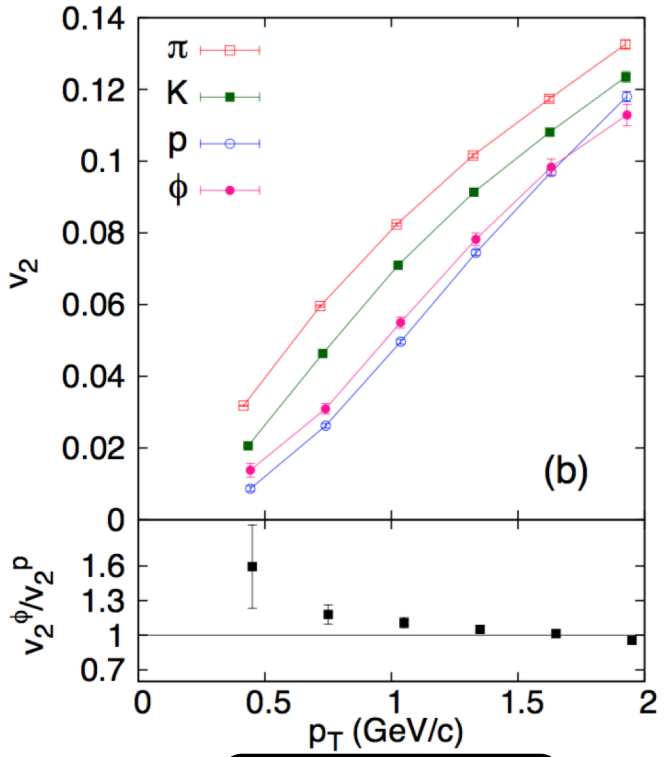
STAR: Phys. Rev. C.105, 064911 (2022)
孙旭，施梳苏等

$v_2(\phi)$ versus $v_2(p)$

Model calculations: T. Hirano et al., ; PRC77, 044909 (2008), PRC92, 044907 (2015)



Before hadronic re-scattering



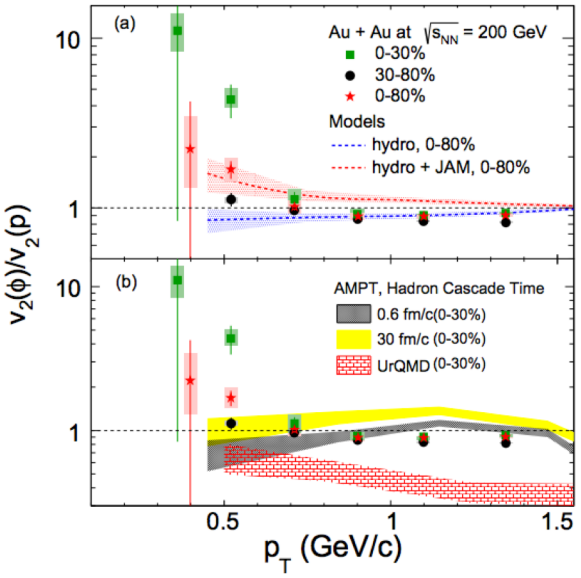
After hadronic re-scattering

- **Ideal hydro + hadron cascade (JAM)**
- **Small hadron cross section + hadronic re-scattering effect on v_2**

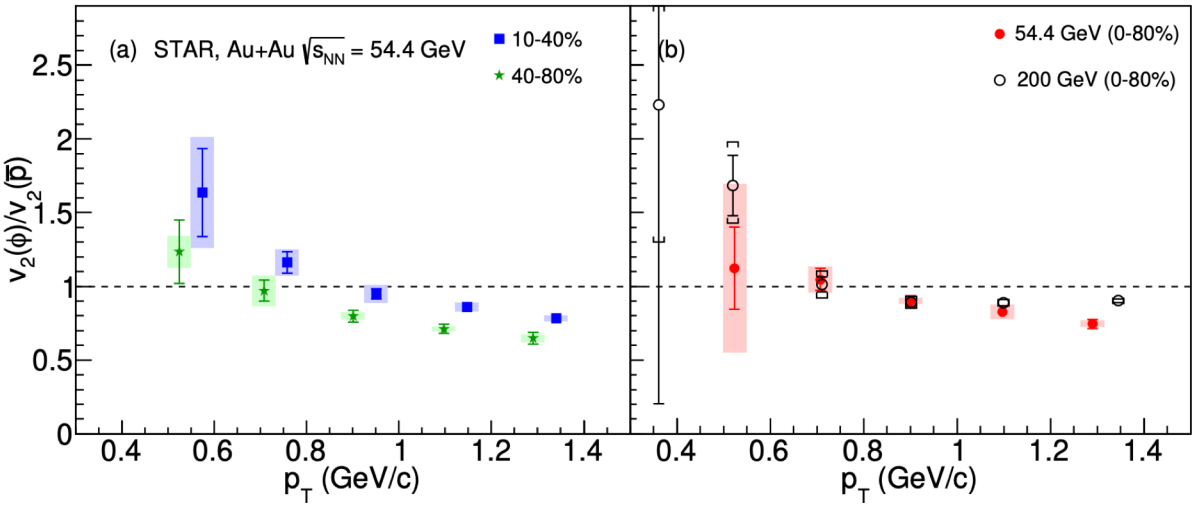
  Mass ϕ > mass p ➔ $v_2(\phi) > v_2(p)$

  ➔ ***Break mass ordering for ϕ mesons and protons***

$v_2(\phi)$ versus $v_2(p)$



STAR: Phys. Rev. Lett.116, 062301 (2016)

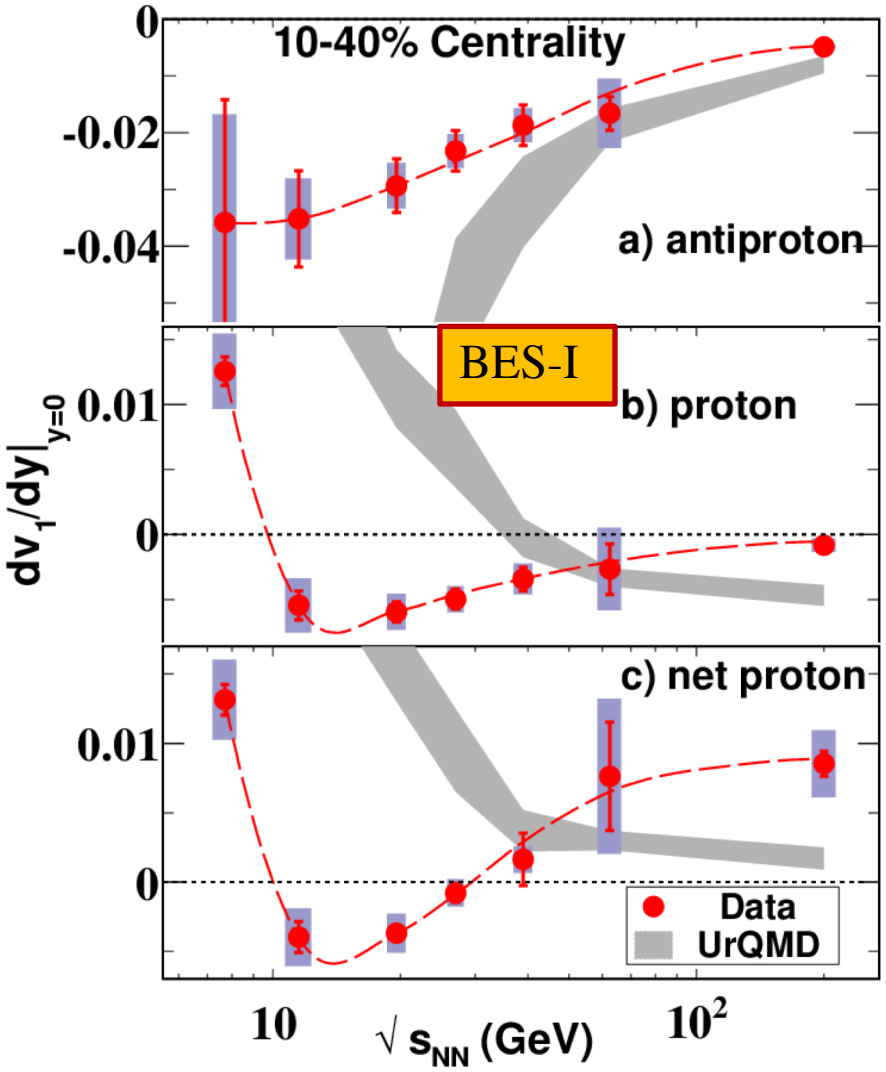


STAR: arXiv: 2205.11073 兰少位，施梳苏等

- Violation of mass ordering in central collisions at 54.4 and 200 GeV
- Energy and centrality dependence of hadronic rescattering effect

v_1: Softest Point

BESII : centrality dependence



dv_1/dy: the slope of directed flow versus rapidity near mid-rapidity

- Hydrodynamic calculation with the 1st-order phase transition motivates the study
- Net-proton slope changes sign twice

  EOS softest point?
- UrQMD fails to reproduce the data

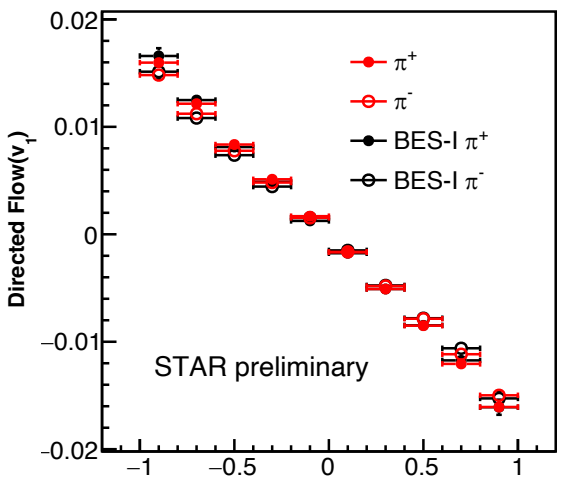
The slope of net-p is based on expressing the y dependence of v1 for all protons as:

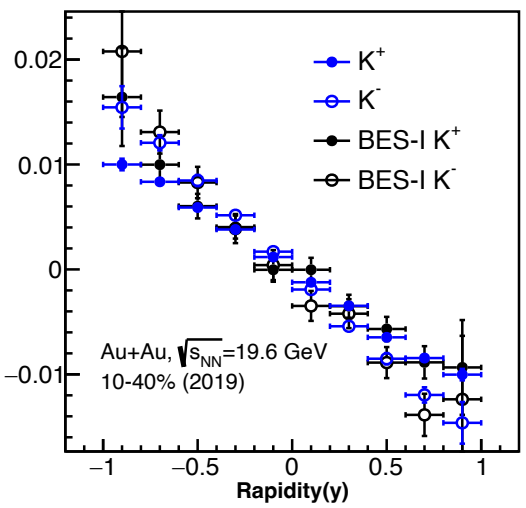
$$[v_1(y)]_p = r(y)[v_1(y)]_{\bar{p}} + [1 - r(y)][v_1(y)]_{\text{net-}p}$$

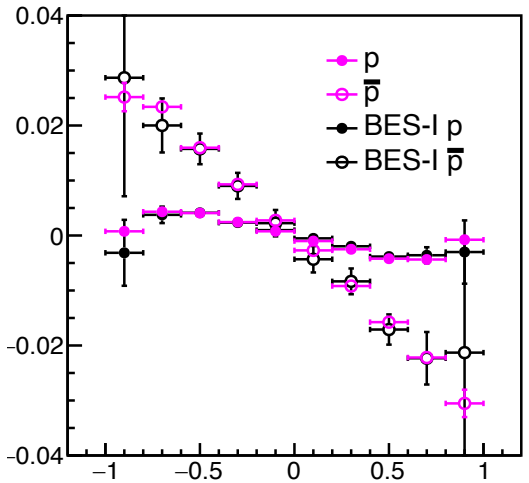
r: the ratio of anti-p to p.

STAR: Phys. Rev. Lett. 112, 162301(2014)
H. Stoecker, Nucl. Phys. A 750, 121(2005)

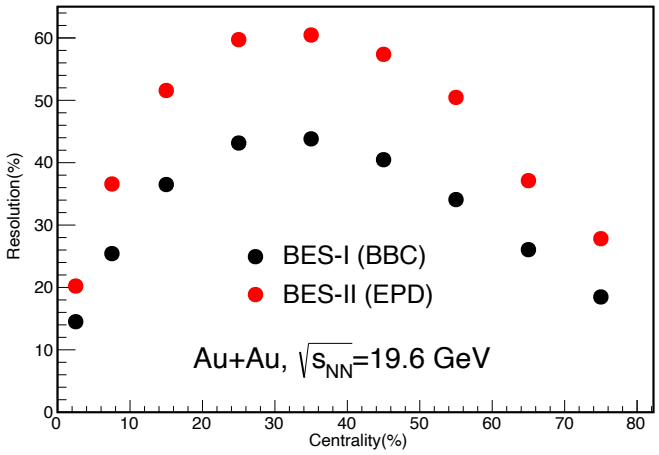
BESII v_1: 19.6 GeV





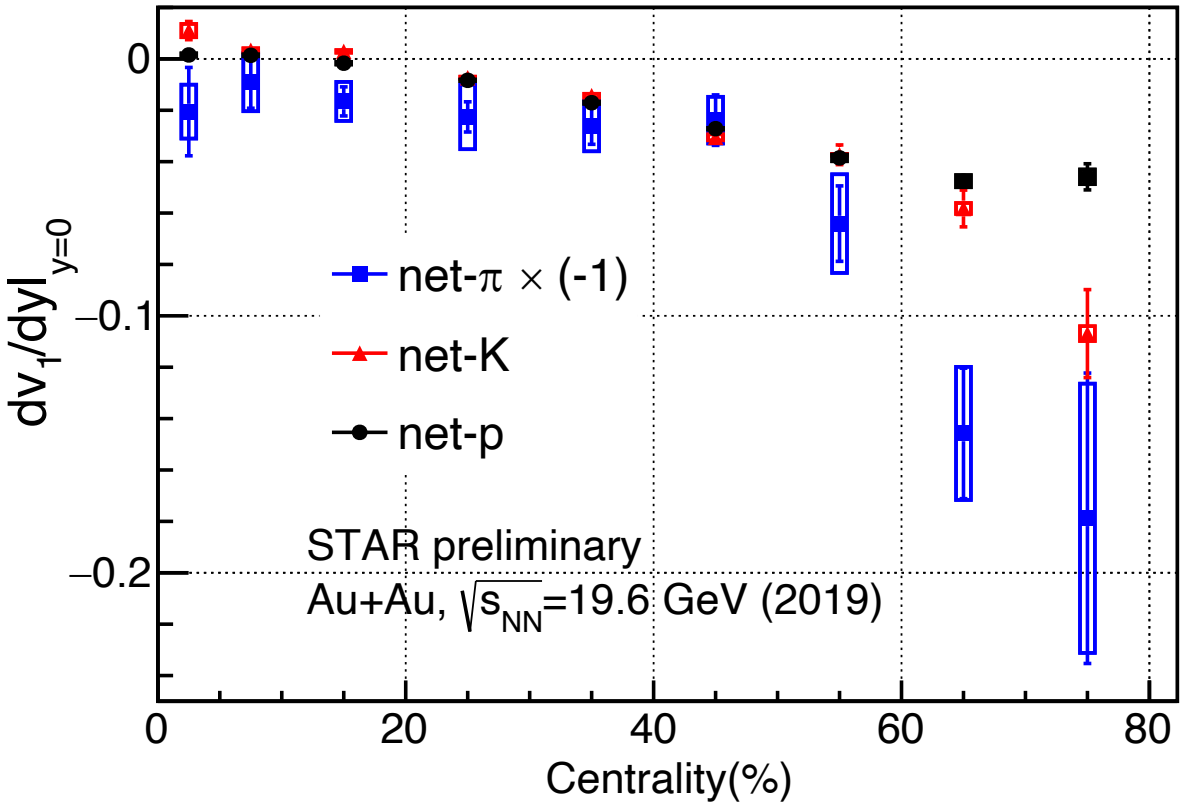


STAR 刘佐文: SQM2022, ISMD2022



- Resolution improved about 50% comparing to BES-I
- The statistical uncertainties reduced by a factor 8 comparing to BES-I results.

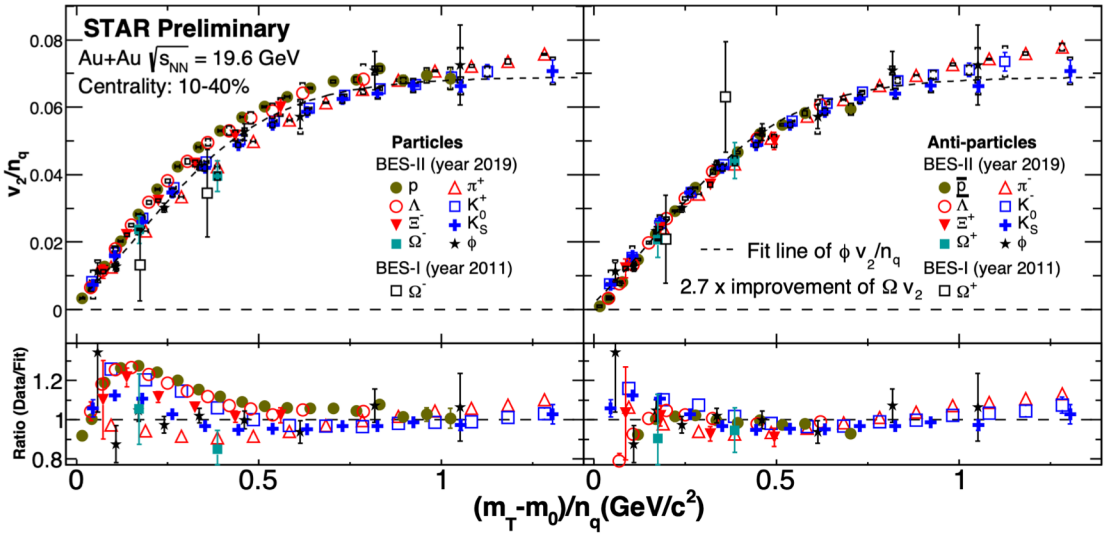
dv_1/dy vs. Centrality



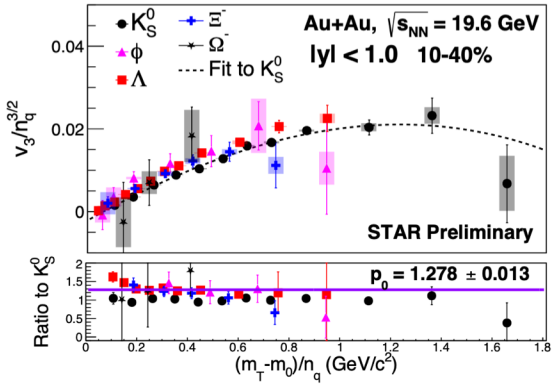
- v_1 slope of net-particle is larger in more peripheral collisions
  More transported quarks in the peripheral collisions
- v_1 slope of net-proton and net-kaon are similar in central and mid-central collisions
- 14.6 GeV: wait for final official centrality definition

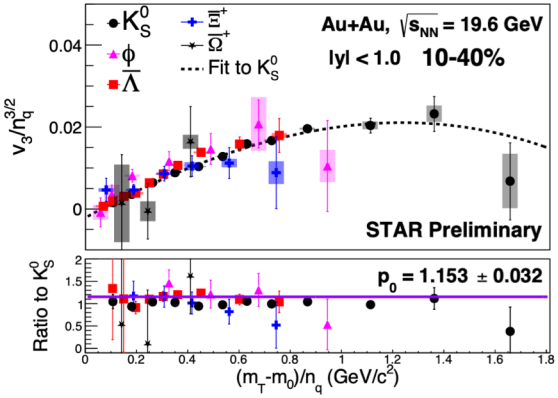
Net-pion dv1/dy is positive at all centralities. To facilitate plotting in the figure opposite, net-pion dv1/dy is shown with reversed sign.

BESII v_2: 19.6 GeV



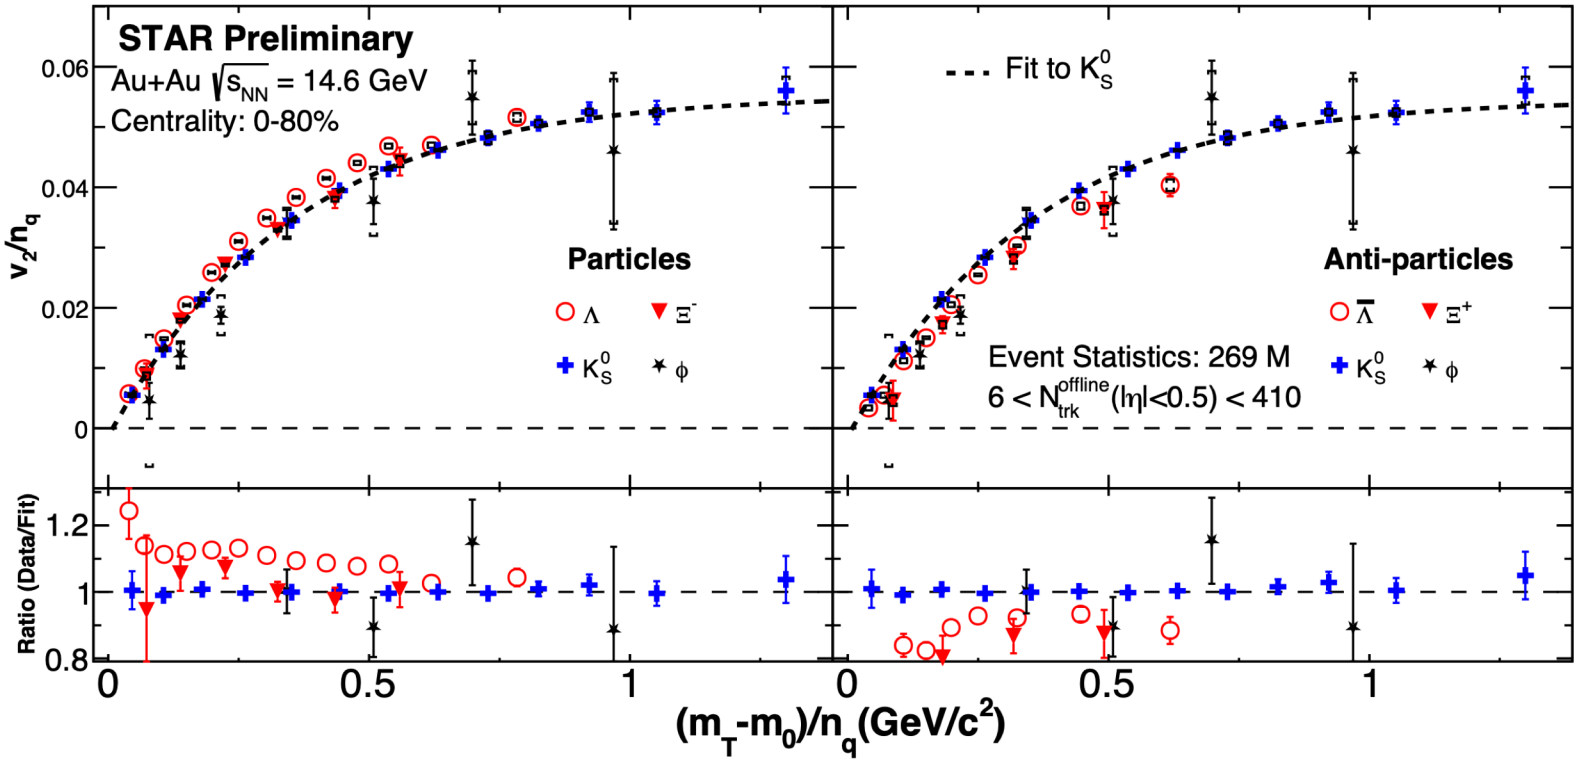
STAR 刘利珂: SQM2022





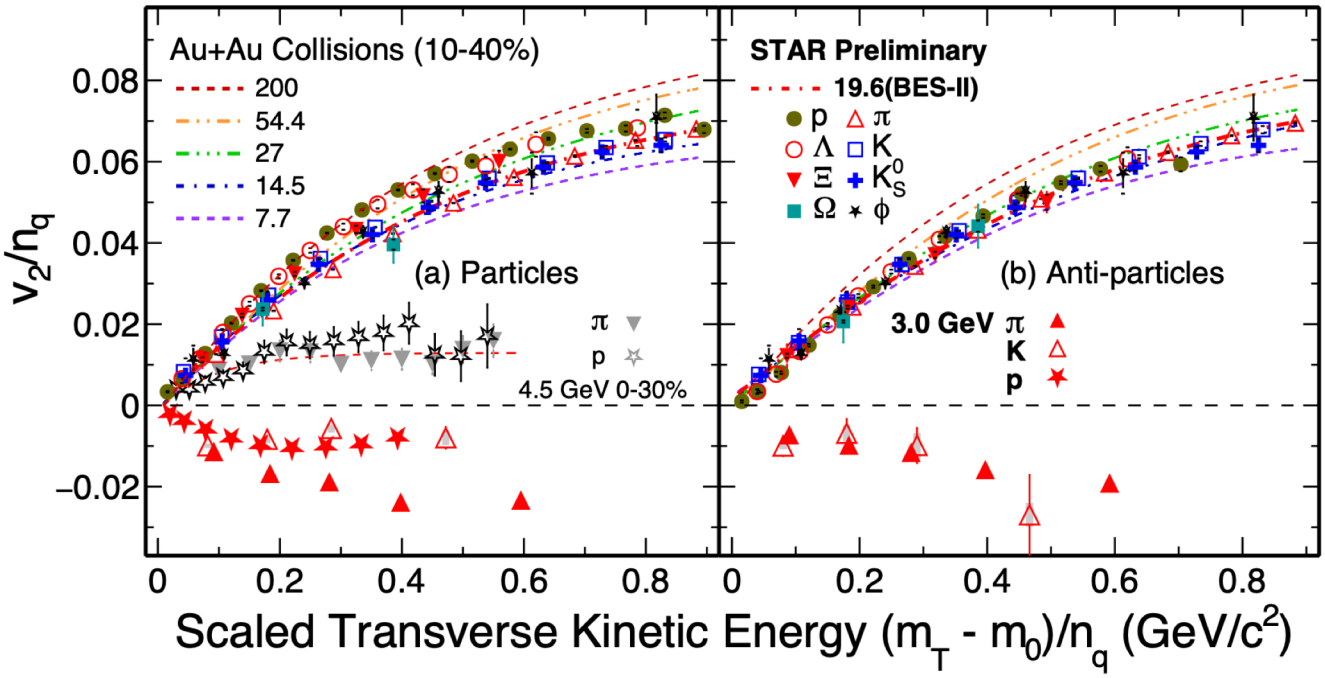
- The NCQ scaling holds within 20% for particles and within 10% for anti-particles
- The NCQ scaling of anti-particles better than particles: produced vs. transported quarks

BESII v_2: 14.6 GeV



- The NCQ scaling holds within at 20% level

NCQ Scaling at 3 GeV

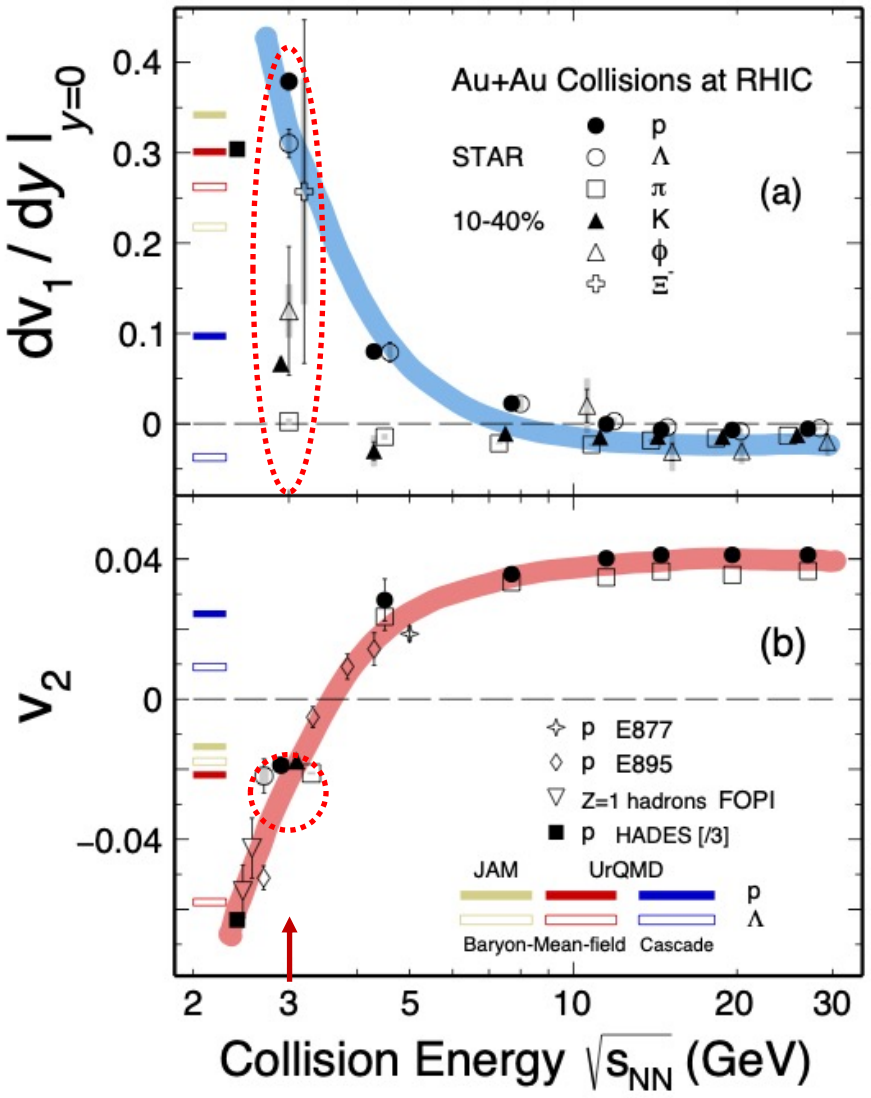


STAR: Phys. Lett. B 827 (2022) 137003 兰少位，施梳苏等

- The number of constituent quark (NCQ) scaling for v_2 holds down to 4.5 GeV, consistent with the nature of partonic collectivity
- At 3 GeV, the measured v_2 for all particles are negative and NCQ scaling is absent, especially for positive charged particles

STAR: Phys. Rev. C 88 (2013) 14902; Phys. Lett. B 827 (2022) 137003
X. Dong et al. Phys. Lett. B 597 (2004) 328-332

v_1 Slope and v_2 vs. Energy



- The v_1 slopes ($dv_1/dy|_{y=0}$) of baryons at 3 GeV are positive and larger than those of mesons
- For the first time, kaon and ϕ v_1 slopes are found to be positive at 3 GeV
- Opposite collective behavior to high energy results
- The results from UrQMD with baryonic mean-field potential qualitatively describe data at 3 GeV

EoS dominated by the baryonic interactions at 3 GeV

Summary

- **High Energy Collisions**
  - **Higher-order flow:** ***partonic collectivity***
  - **$v_2(\phi)/v_2(p)$:** ***hadronic contribution on partonic flow***

- **Beam Energy Scan (II)**
  - **v_1:** ***centrality dependence done for 19.6 and 14.6 GeV***
  - **v_2 and v_3:** ***multi-strange hadrons done for 19.6 and 14.6 GeV***
  - **3 GeV:** ***indication of new medium properties and an EoS dominated by baryonic interactions***

Mapping the QCD phase diagram with more collision energies from BES-II

BES-II

Electron cooling + longer beam bunches for BES-II
factor 4-15 improvement in luminosity compared with BES-I

RHIC BES-II：2019-2021

19.6, 17.1, 14.5, 11.5, 9.2 and 7.7 GeV
FXT: 3-7.7 GeV
Focus on $\sqrt{s_{NN}} \leq 20$ GeV region

Detector upgrade

- **Event Plane Detector**
  important for flow and fluctuation analyses
- **iTPC upgrade**
  increases TPC acceptance to ~1.7 in η; improves dE/dx resolution
- **ETOF upgrade**
  New charged hadron PID capabilities for 1.1<|η|<1.6

Fixed target program

extends STAR's physics reach to region of compressed baryonic matter
