Collaboration High precision design

R&D of FCAL

W. Lohmann, DESY, on behalf of FCAL

- Simulation studies
- Sensors
- FE ASICs
- System Tests
- short- and midterm plans

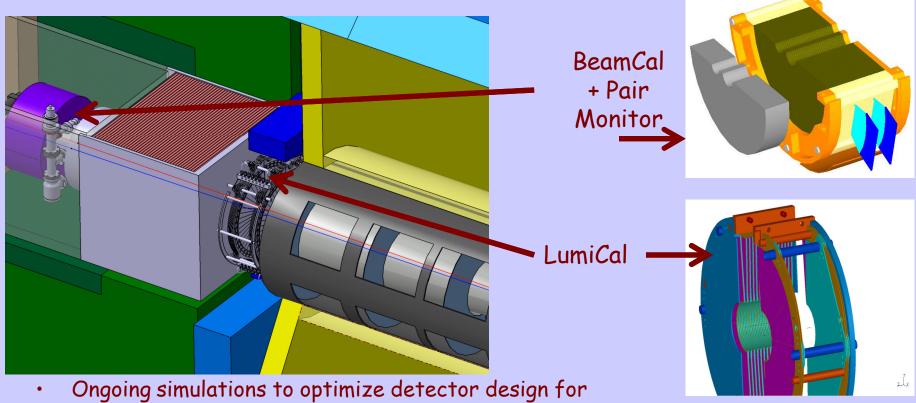

Labs involved: Argonne, Vinca Inst, Belgrade, Bukharest, CERN, Univ. of Colorado, Cracow UST, Cracow INP, IKP Dresden, JINR, Royal Holloway, NCPHEP, UC Santa Cruz,

Stanford University, SLAC

Tuhoku Univ., Tel Aviv, Univ., DESY (Z.)

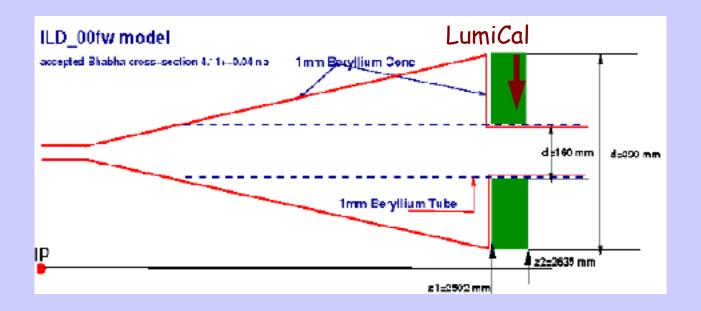

Very forward detectors-challenges

- - precise luminosity measurement,
 - hermeticity (electron detection at low polar angles),
 - assisting beam tuning (fast feedback of BeamCal data to machine)
- Challenges: radiation hardness (BeamCal), high precision (LumiCal) and fast readout (both)

Simulation Studies, example beam-pipe shape

Simulation using 10⁶ Bhabha events indicates no impact on the precision of the Lumi measurement

However: keep the conical volume empty

See also the talk by Ivanka Bozovic-Jelisavcic in the MDI session, Monday, March 29, 12.00, and Andre Sailer, BDS_MDI session, Monday 29 March, 2.25

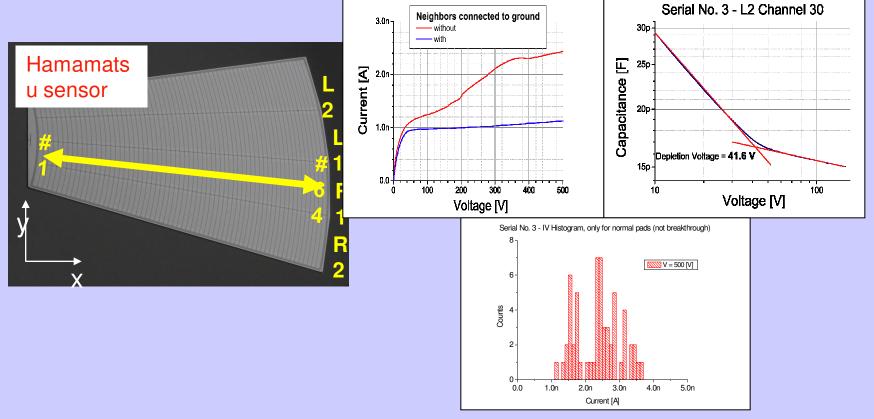

LumiCal sensors

LumiCal: low irradiation load → silicon-tungsten sampling calorimeter

- Design (optimized geometry for luminosity measurement)
- Hamamatsu sensor prototypes (6", p in n, DC-coupled, 350 μm thick)

Measurements in Cracow, DESY, Tel Aviv (cross calibration)

March 28, 2010

LCWS Beijing

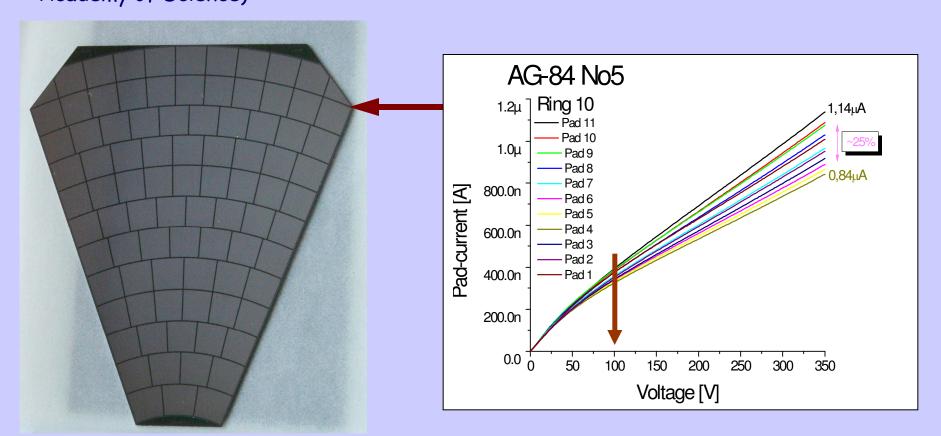

Pose Rose of Street

GaAs sensors, delivered by JINR (produced in Tomsk, Sibirian Academy of Science)

 $500 \mu m$ thickness, 3 inch wafer, Au metallisation

Probe station measurements

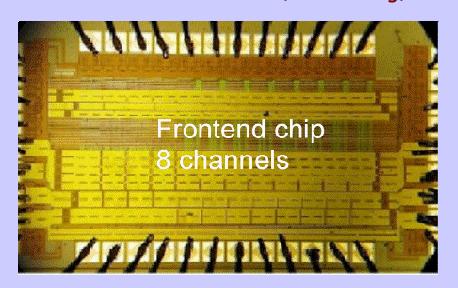

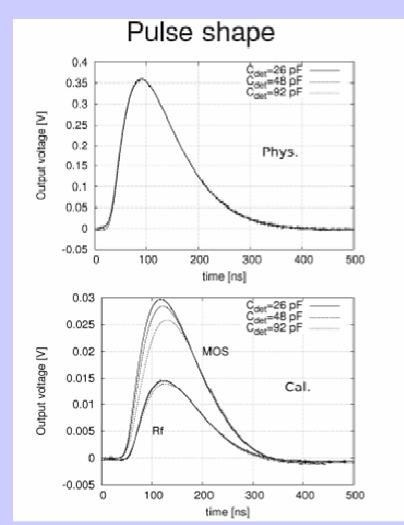

FE ASICs, LumiCal

- Frontend readout prototype chip developed at UST Cracow, manufactured in a MPW run (0.35 μm AMS)
- 8 channels, passive or MOS feedback
- Two amplification ranges (MIP and physics data taking)
- Measured in Cracow and Zeuthen:
 - Noise $\approx 300 e^{-} (+ 28 e^{-}/pF)$,
 - gain ≈ 20 mV/fC (calibration mode),
 0.11 mV/fC (data taking)

Rad. Hard Silicon sensor tests at the NLCTA beam (150-200 MeV electrons)

SLAC and UC Santa Cruz

SENSOR DUMMY

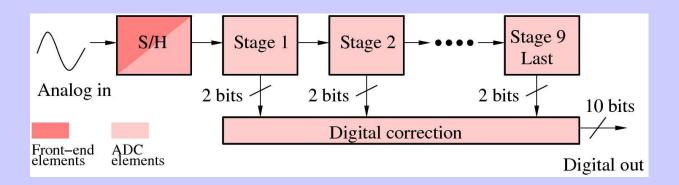

n- and p-type float-zone and magnetic Czochralski sensors Create neutron flux by absorber

See also the talk by Bruce Schumm in the MDI session

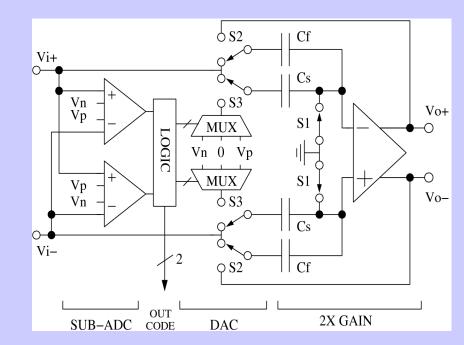

Collaboration High precision design

ADC ASICs, LumiCal

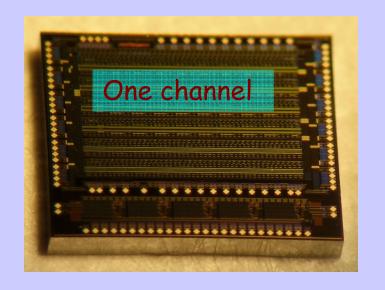

- 10 bit pipeline ADC 1.5 bit/stage
- Variable sampling frequency up to ~25
 Ms/s
- Scalable power consumption
- Fully differential
- Power switching OFF/ON (ILC, CLIC beam timing)
- Present version in 0.35 µm AMS, finer pitch technology soon...

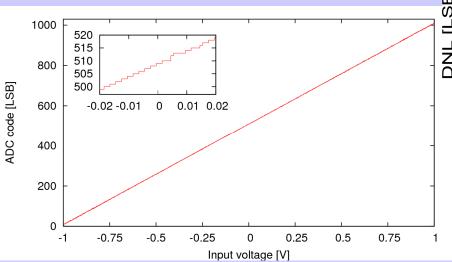

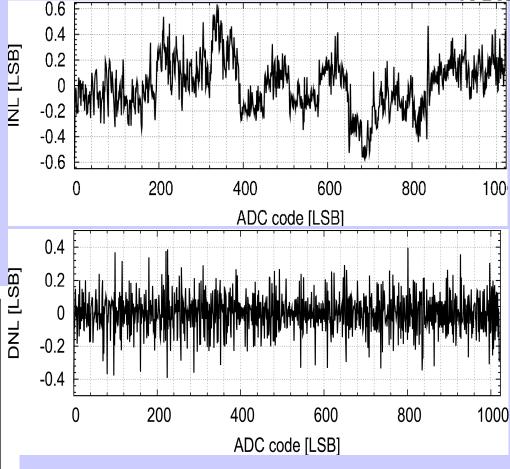

ADC ASIC, static measurements

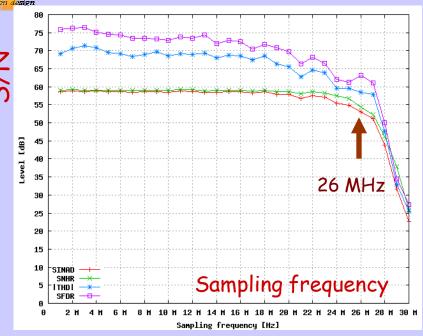

Very good linearity INL < 0.61LSB, DNL < 0.5 LSB

ADC ASIC, power consumption, switching

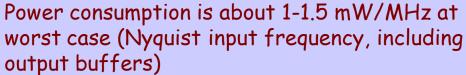

Collaboration

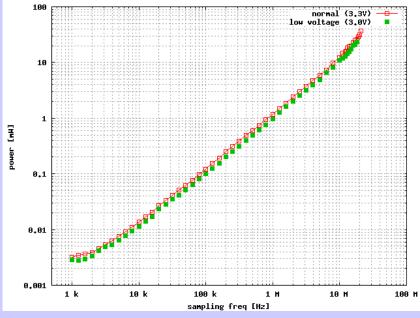

ADC dynamic measurements

Good dynamic performance ENOB

~ 9.5 bit

Power switching ON/OFF tested. Depending on sampling frequency 8-16 clocks needed to turn power ON

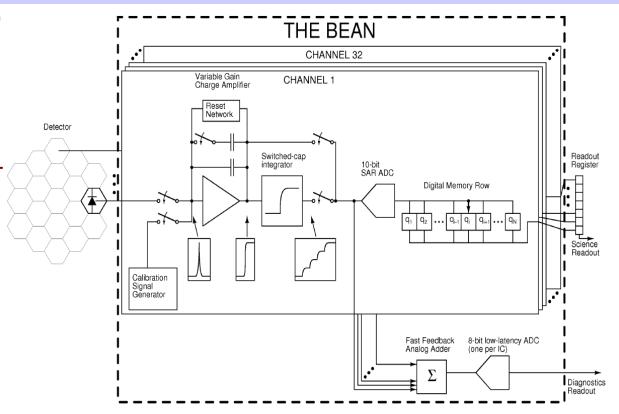

We have just submitted 8 channels ADC version layout with a pitch 200 µm per channel

FE ASICS, BeamCal

- "High" input rate (3.25 MHz)
- High occupancy (100%)
- Large input signals (~40pC)
- Large input capacitance (~40pF detector + wires)
- High resolution (10 bits)
- Dual gain (50x) for different modes of operation: science and detector calibration
- Low latency (~1us) output for beam diagnostics
- High radiation (1Mrad total dose)

- Design at Stanford University (KPiX technology)
- readout between bunch trains
- prepared for fast feedback (diagnostics readout to machine)
- prototypes now available

See also the talk by Angel Abusleme in the MDI session

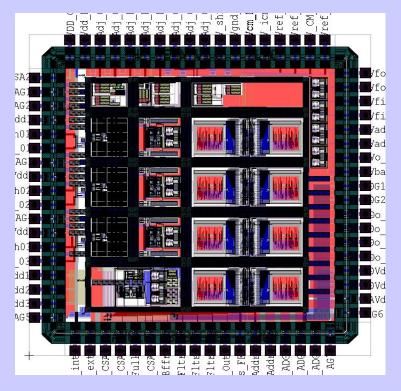

March 28, 2010

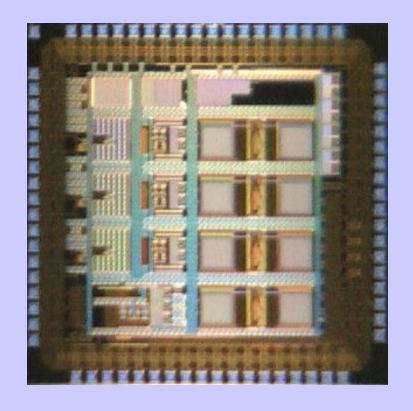

LCWS Beijing

FE ASICs, BeamCal

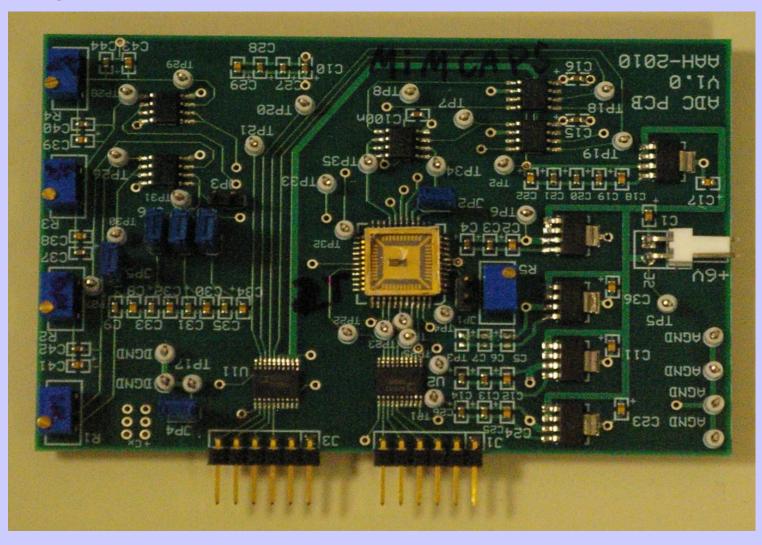

- •TSMC 0.18um, 1.8V
- •72 pads, 2.4mm x 2.4mm (incl. pads)
- •7306 nodes, 35789 circuit elements
- \cdot 3 charge amplifiers, 4 x 10-bit, fully diff. SAR ADCs, 1 SC adder, 3 SC filters

ADC Test Board

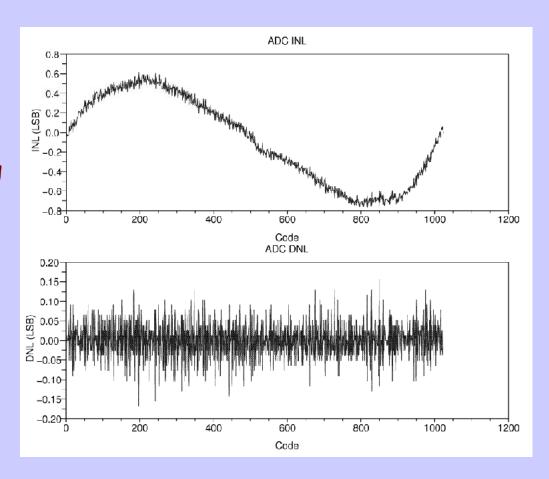

FE ASICs, BeamCal

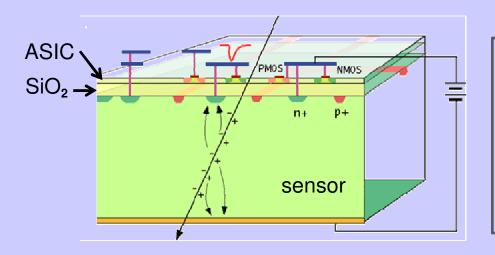

- MIMCaps (16-fF unit capacitance) ADC linearity results:
 - DNL is excellent, no missing codes
 - INL looks strange, but cause has been explained (copper dishing)
 - ADC meets noise and speed requirements

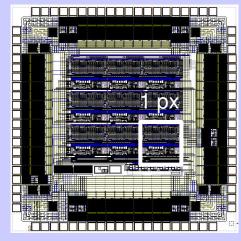

• Pixel size: 400 x 400 μm²

• Radius: 10 cm

Total number of pixels: ~200,000

- → Monolithic construction allows the elimination of the bump-bonding process.
- First step: design of a readout prototype ASIC for 3x3 pixels:
- digital readout (preamp, discriminator, counter)
- manufactured chip (CMOS 0.2 µm, SOI technology)
- performance measurements:
 - gain: ~ 17 mV/fC
 - noise: $\sim 260 \, e^- \, (+ \, 130 \, e^-/pF) \, @ \, signals \sim 20000 \, e^-$

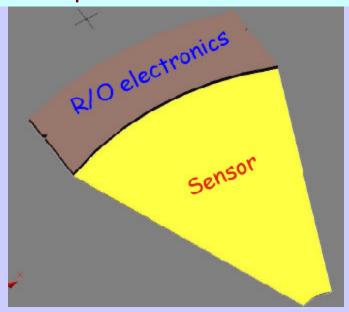

Next steps in FCAL R&D

Full assembly of a Prototype Sector

- Sensors and ASICs connection (Cracow, DESY, help from other labs)
- DAQ (+Tel Aviv)
- Preparation of a Beamtest in Summer at DESY

 intense simulation effort to understand signal and background in LumiCal and BeamCal at 3 TeV for the CLIC detector CDR April 2011

Midterm (>2012):

FP7 application (AIDA)

- Infrastructure to allow 'Physics studies" after 2012
- Cracow (2x), DESY, Tel Aviv (from EUDET)
 - + VINCA and IFIN-HH (associats)

FP7 Partners:

```
AGH-UST Cracow (Marek Idzik)
CERN Geneva (Lucie Linssen)
DESY Zeuthen (W. Lohmann)
IFJPAN Cracow (L. Zawiejski)
TAU Tel Aviv (H. Abramowicz)
```

FCAL Specific infrastructure:

- •Flexible, high precision tungsten structure
- Fast FE Readout
- Module construction and test devices (jigs, mechanics and electronics test facilities)
- Position control devices
