Preliminary Event Selection and Check of Charge Distribution

Siman Liu

Cluster Counting Meeting

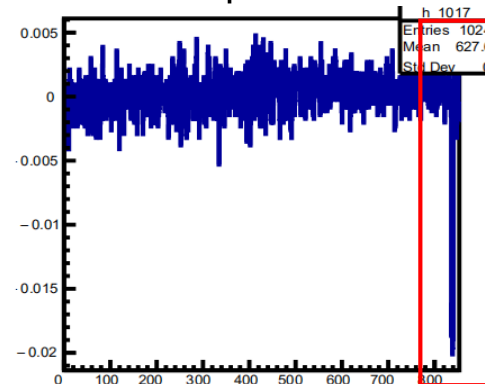

Feb 18th, 2022

Event Selection

Parameters

- Study focused on the 1cm tubes
- Event selection
 - Remove the points with abnormal values
 - For a good waveform, the maximum value of the absolute amplitude after subtracting the baseline should be more than **0.02mV**
 - For a good event, at least four tubes with signal is required

Determination of baseline

- The averaged amplitude of 50 consecutive bins on the right box

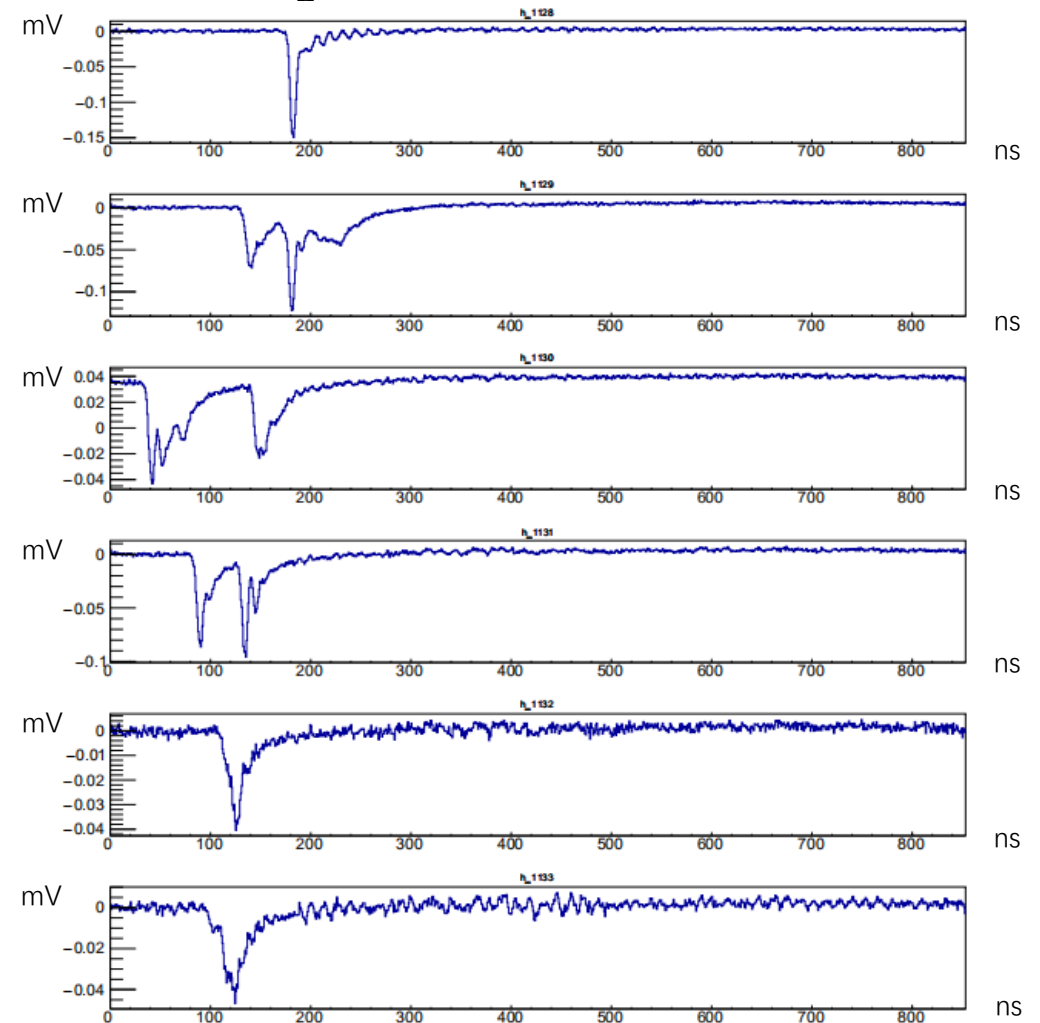

Preliminary results

muons_165GeV_voltagePlus10V_angle0_GSPS1p2_delay725ns_7Nov_0758

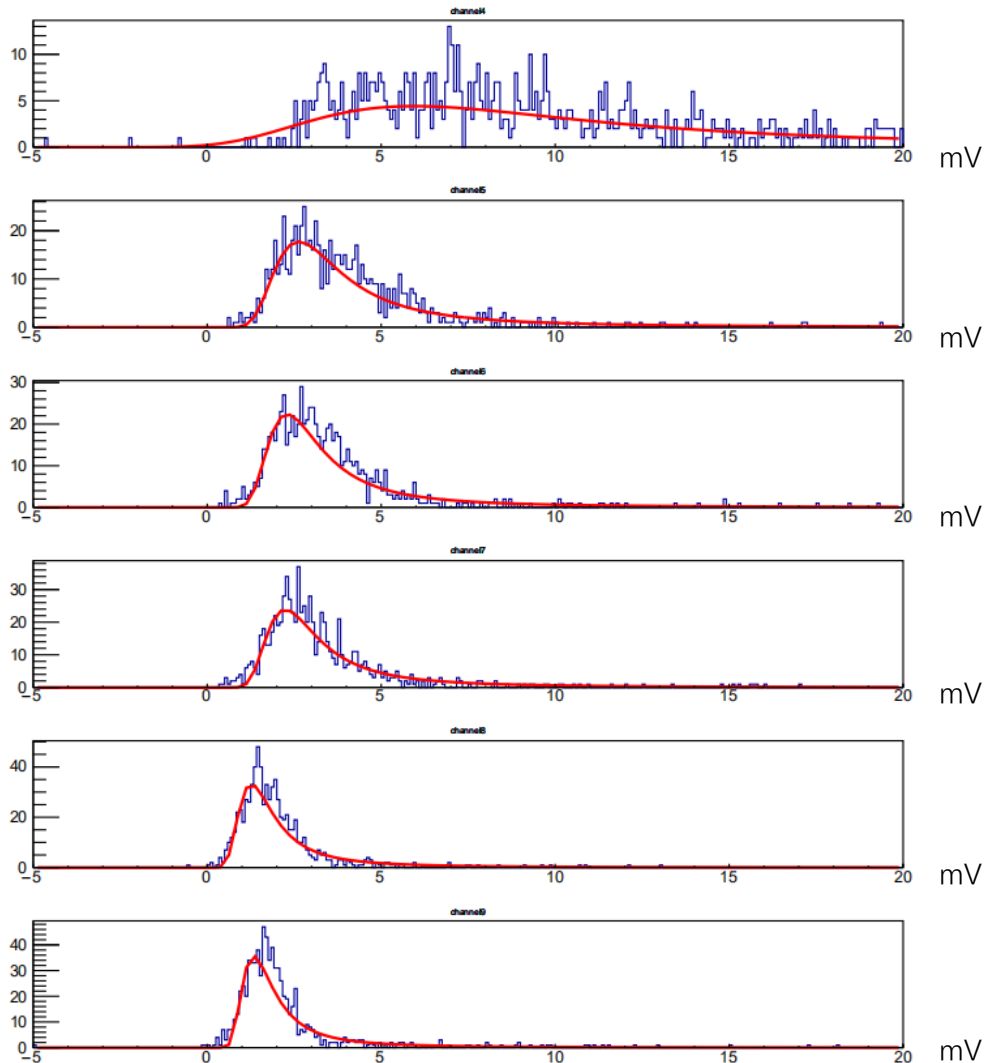

total events : 5000

Number of tubes with signal	Number of event	proportion
0	4042	0.8084
1	79	0.0158
2	73	0.0146
3	69	0.0138
4	61	0.0122
5	123	0.0246
6	553	0.1106

A good event after selection

Charge distribution

- charge distribution of each tube obtained
- fitted to Landau distribution

Next to do

- Analysis with peak finding algorithm.
