deconfinement

# The nuclear modification factor $R_{AA}$

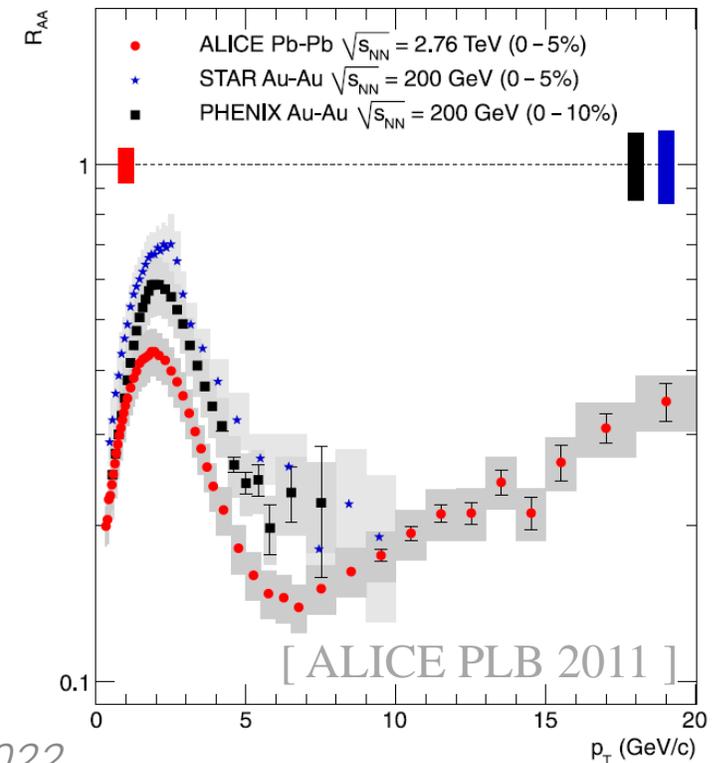

The ratio of  $p_T$  spectrum in  $AA$  to that in  $pp$  collisions:

$$R_{AA}(p_T) = \frac{1}{\langle N_{coll} \rangle} \frac{dN^{AA}/dp_T}{dN^{pp}/dp_T}$$

**= 1,  $AA$  collision is simple superposition of  $pp$  collisions**  
 **$\neq 1$ , hot / cold medium effects, others...**

[ David d'Enterria 2009 ]

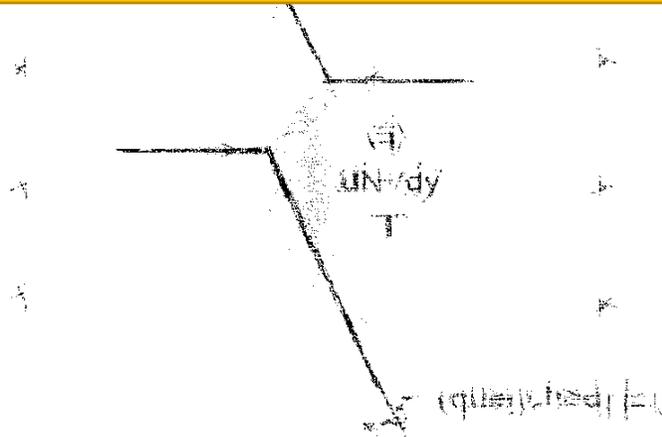

# The nuclear modification factor $R_{AA}$

The ratio of  $p_T$  spectrum in  $AA$  to that in  $pp$  collisions:

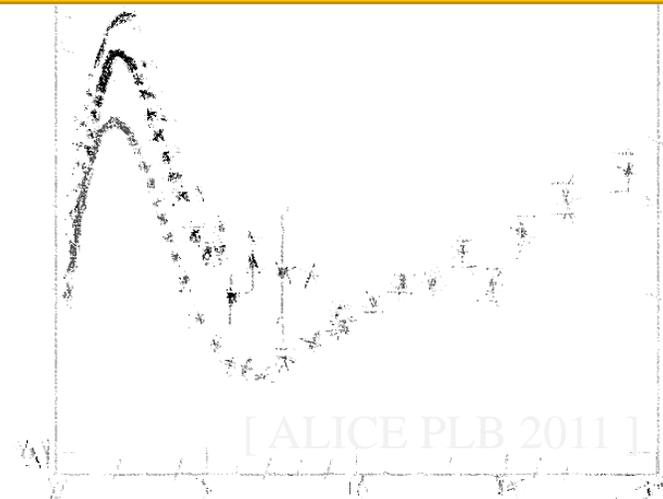

$$R_{AA}(p_T) = \frac{1}{\langle N_{coll} \rangle} \frac{dN^{AA}/dp_T}{dN^{pp}/dp_T}$$

= 1,  $AA$  collision is simple superposition of  $pp$  collisions  
 $\neq 1$ , hot / cold medium effects, others...

How about the  $R_{AA}$  between the hadron and its quark component ?

[ David d'Enterria 2009 ]

[ ALICE PLB 2011 ]

# $R_{AA}$ of the hadron's quark component

The hadron ( $h$ ) normalized  $p_T$  distribution:

$$\frac{1}{N_h} dN_h / dp_T$$

Its quark ( $q$ ) component normalized  $p_T$  distribution:

$$\frac{1}{n_{h-q}} \sum_q \frac{1}{N_q} dN_q / dp_T$$

$n_{h-q}$ : the number of constituent quarks in a hadron  $h$

$N_h(N_q)$ : the multiplicity of the hadron (quark)

# $R_{AA}$ of the hadron's quark component

The hadron ( $h$ ) **un**-normalized  $p_T$  distribution:

$$\frac{1}{N_h} dN_h/dp_T \rightarrow dN_h/dp_T$$

Its quark ( $q$ ) component **un**-normalized  $p_T$  distribution:

$$\frac{1}{n_{h-q}} \sum_q \frac{1}{N_q} dN_q/dp_T \rightarrow \frac{1}{n_{h-q}} \sum_q \frac{N_h}{N_q} dN_q/dp_T$$

$n_{h-q}$ : the number of constituent quarks in a hadron  $h$

$N_h(N_q)$ : the multiplicity of the hadron (quark)

# $R_{AA}$ of the hadron's quark component

The hadron  $R_{AA}^h$ :

$$R_{AA}^h(p_T) = \frac{1}{\langle N_{coll} \rangle} \frac{dN_h^{AA} / dp_T}{dN_h^{pp} / dp_T}$$

Its quark component  $R_{AA}^{h-q}$ :

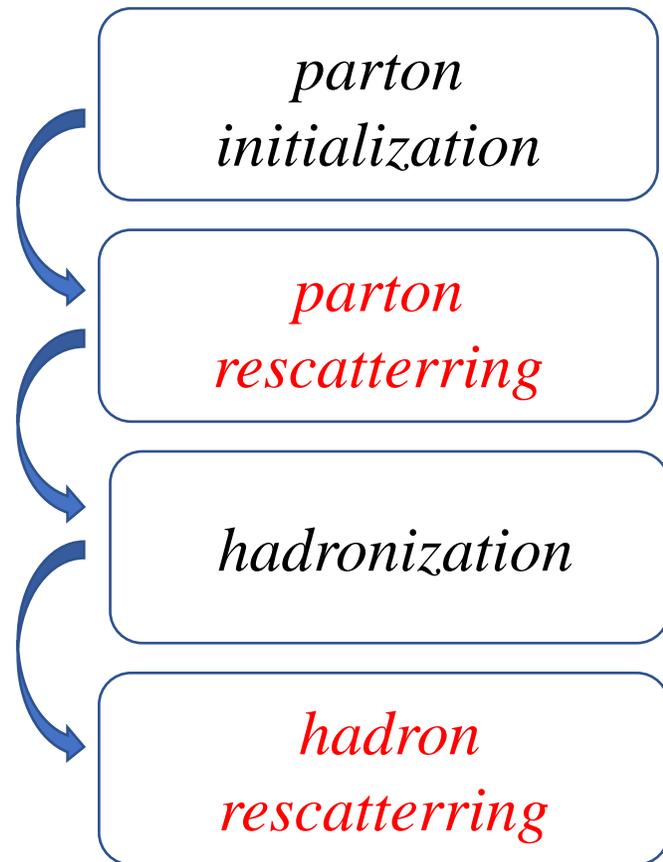

$$R_{AA}^{h-q}(p_T) = \frac{1}{\langle N_{coll} \rangle} \frac{\sum_q w_q^{AA} dN_q^{AA} / dp_T}{\sum_q w_q^{pp} dN_q^{pp} / dp_T}$$

$w_q = N_h / N_q$ : a weight factor

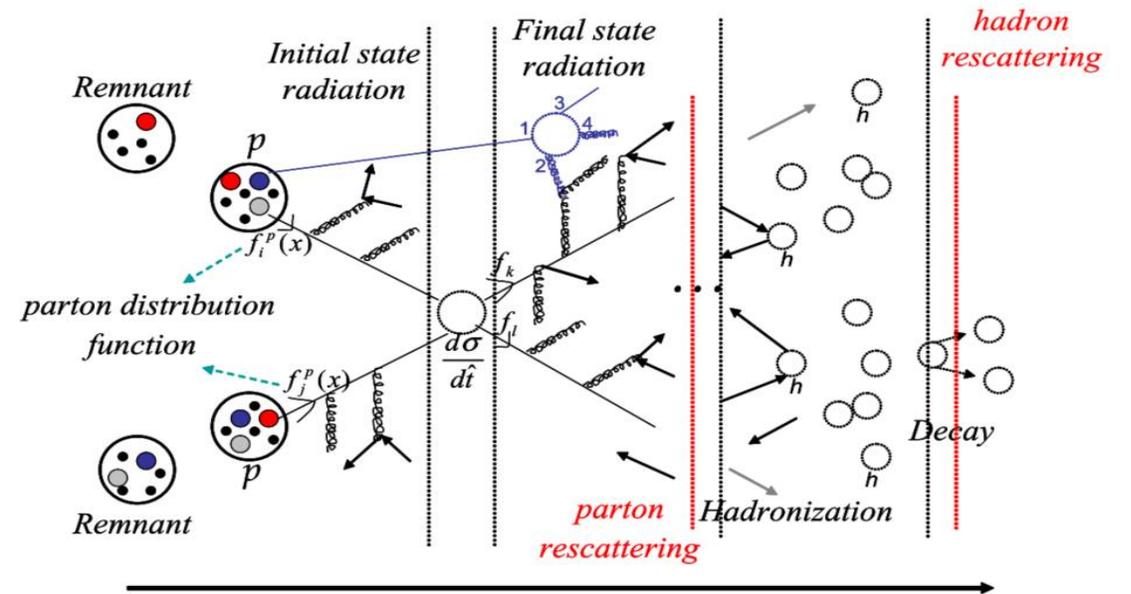

# PACIAE model

# PACIAE model

**PACIAE**: a microscopic parton and hadron transport model ( based on PYTHIA6)

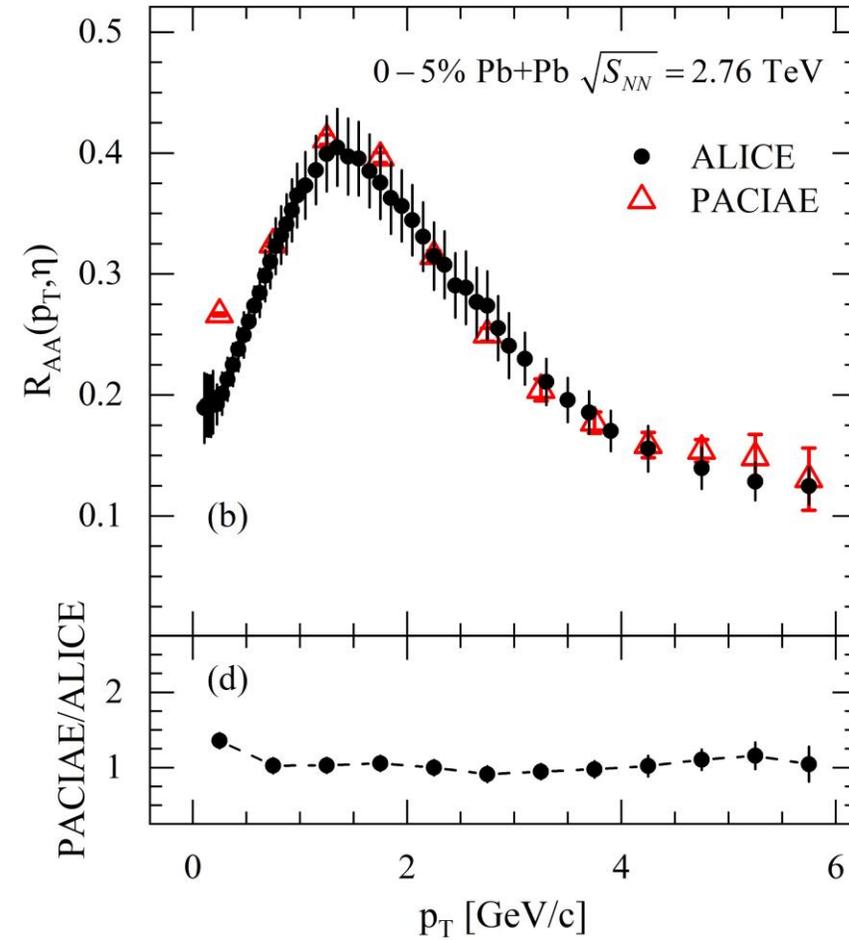

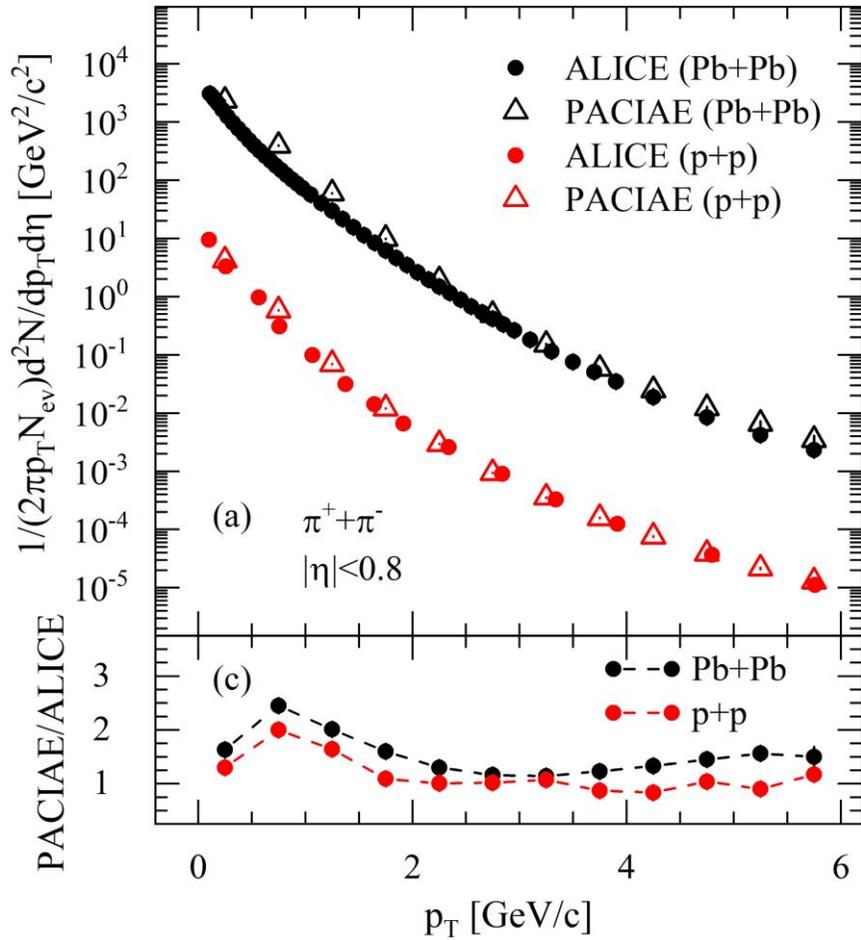

Sketch for  $pp$  dynamic simulation (PYTHIA & PACIAE)

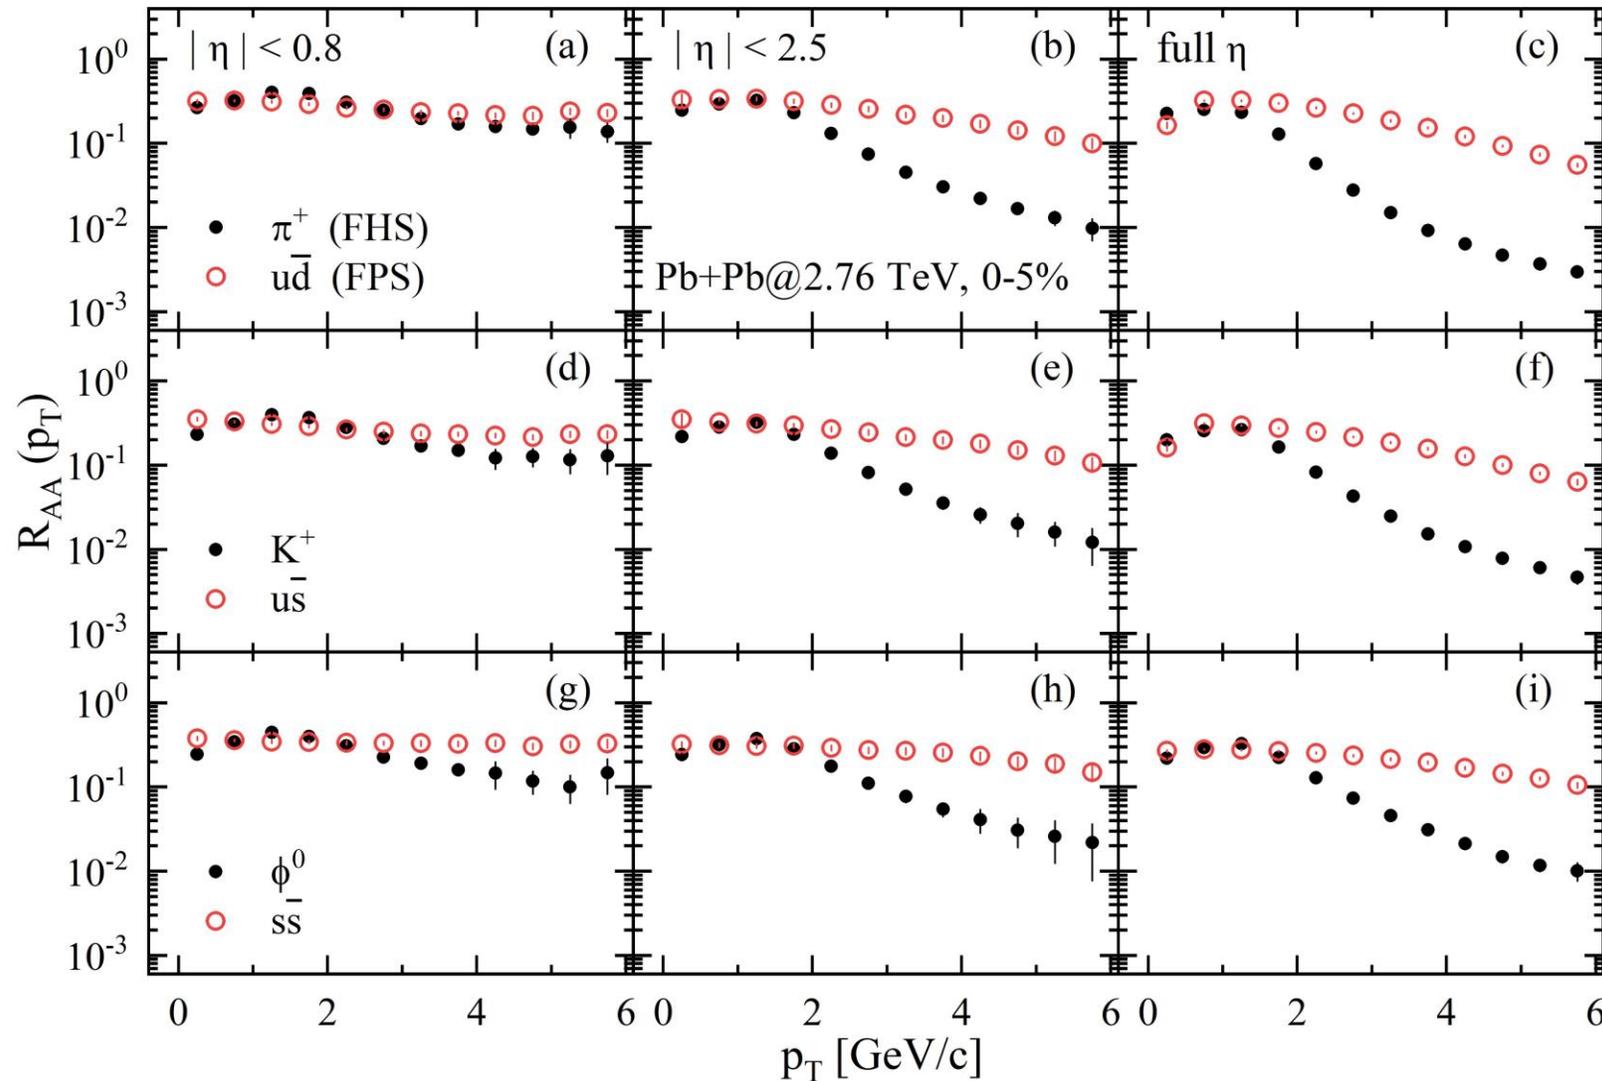

$\pi, K, p, n, \rho(\omega), \Delta, \Lambda, \Sigma, \Xi, \Omega, J/\Psi$

# PACIAE model

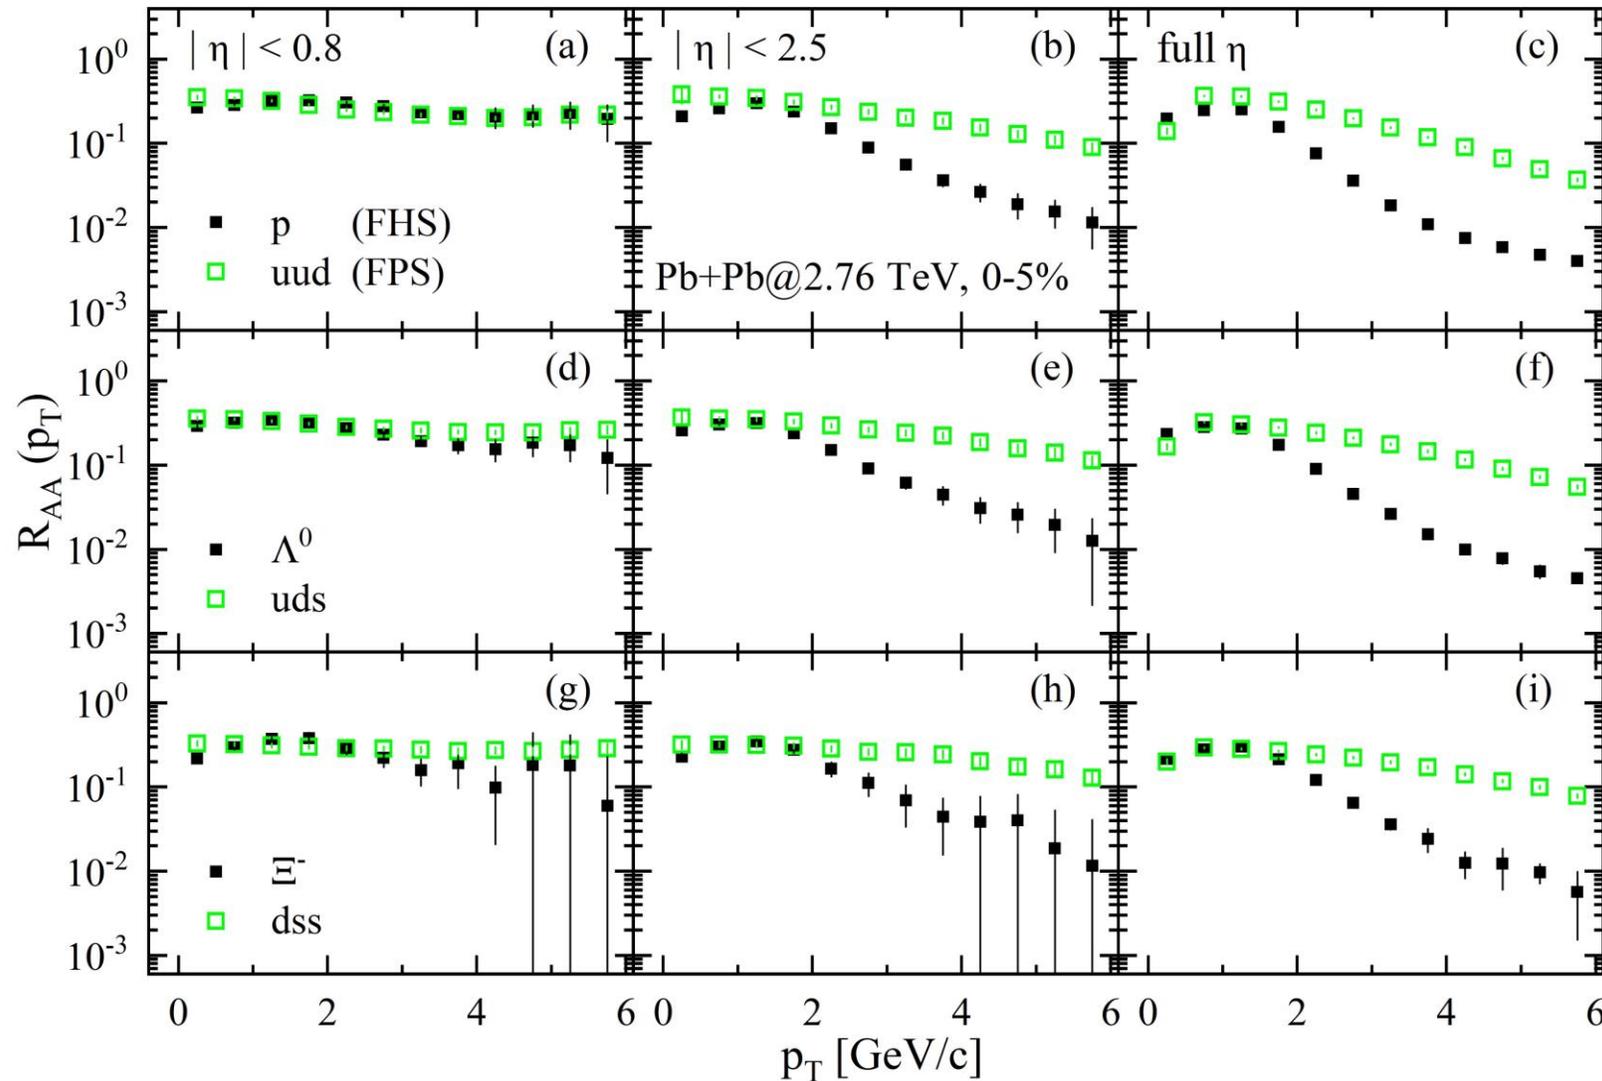

# Results

# Results: rapidity dependence

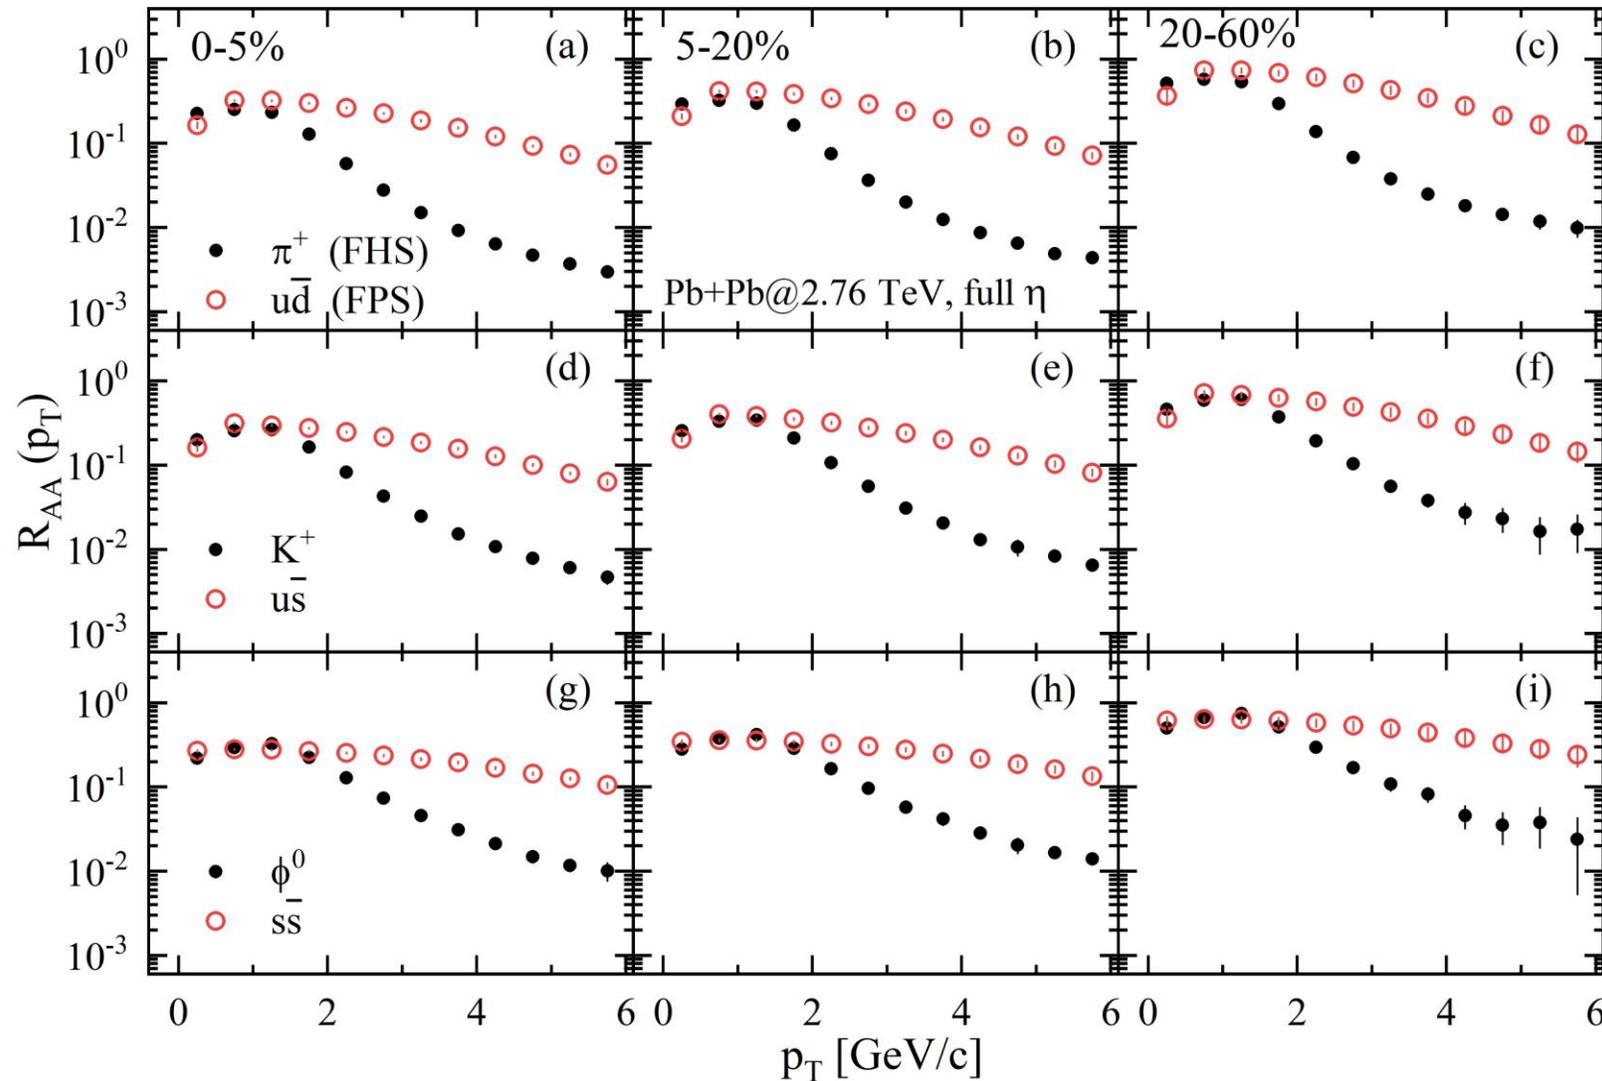

- $R_{AA}^{h-q} > R_{AA}^h$  above  $p_T \sim 2 \text{ GeV}/c$ .
- Kept well in different  $\eta$  ranges.
- More significant discrepancy in the larger  $\eta$  range which includes more particles and energy loss.

# Results: rapidity dependence

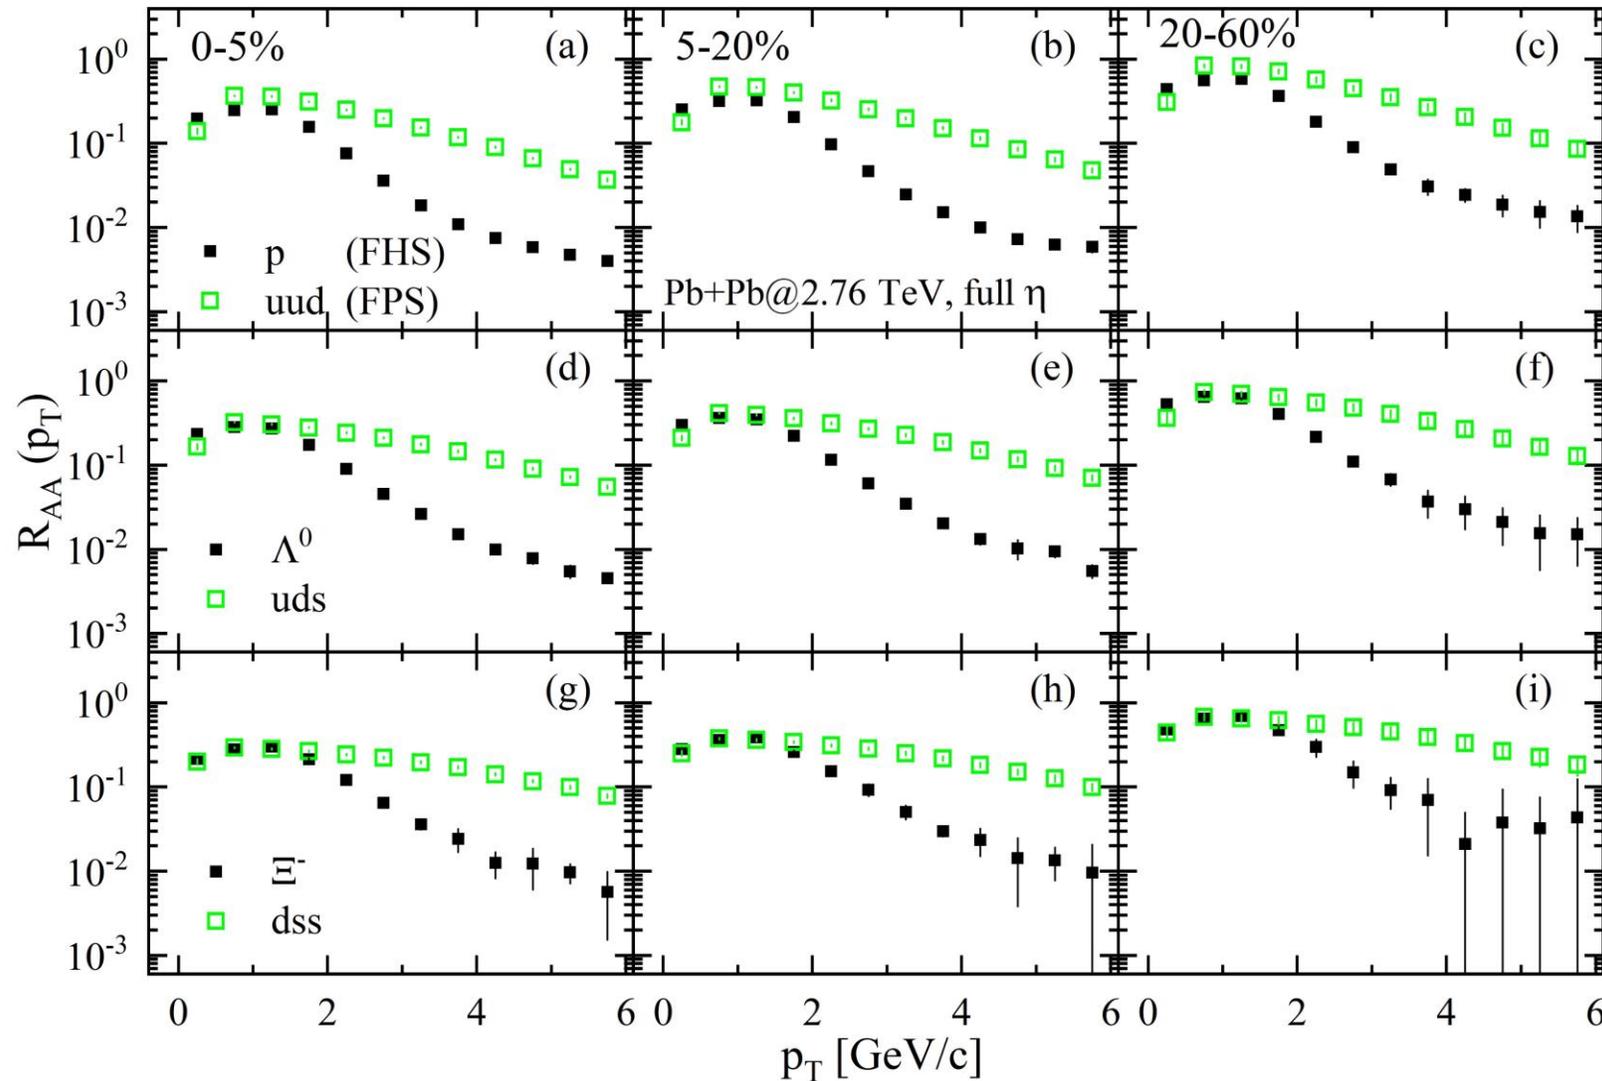

- $R_{AA}^{h-q} > R_{AA}^h$  above  $p_T \sim 2 \text{ GeV}/c$ .
- Kept well in different  $\eta$  ranges.
- More significant discrepancy in the larger  $\eta$  range which includes more particles and energy loss.

# Results: centrality dependence

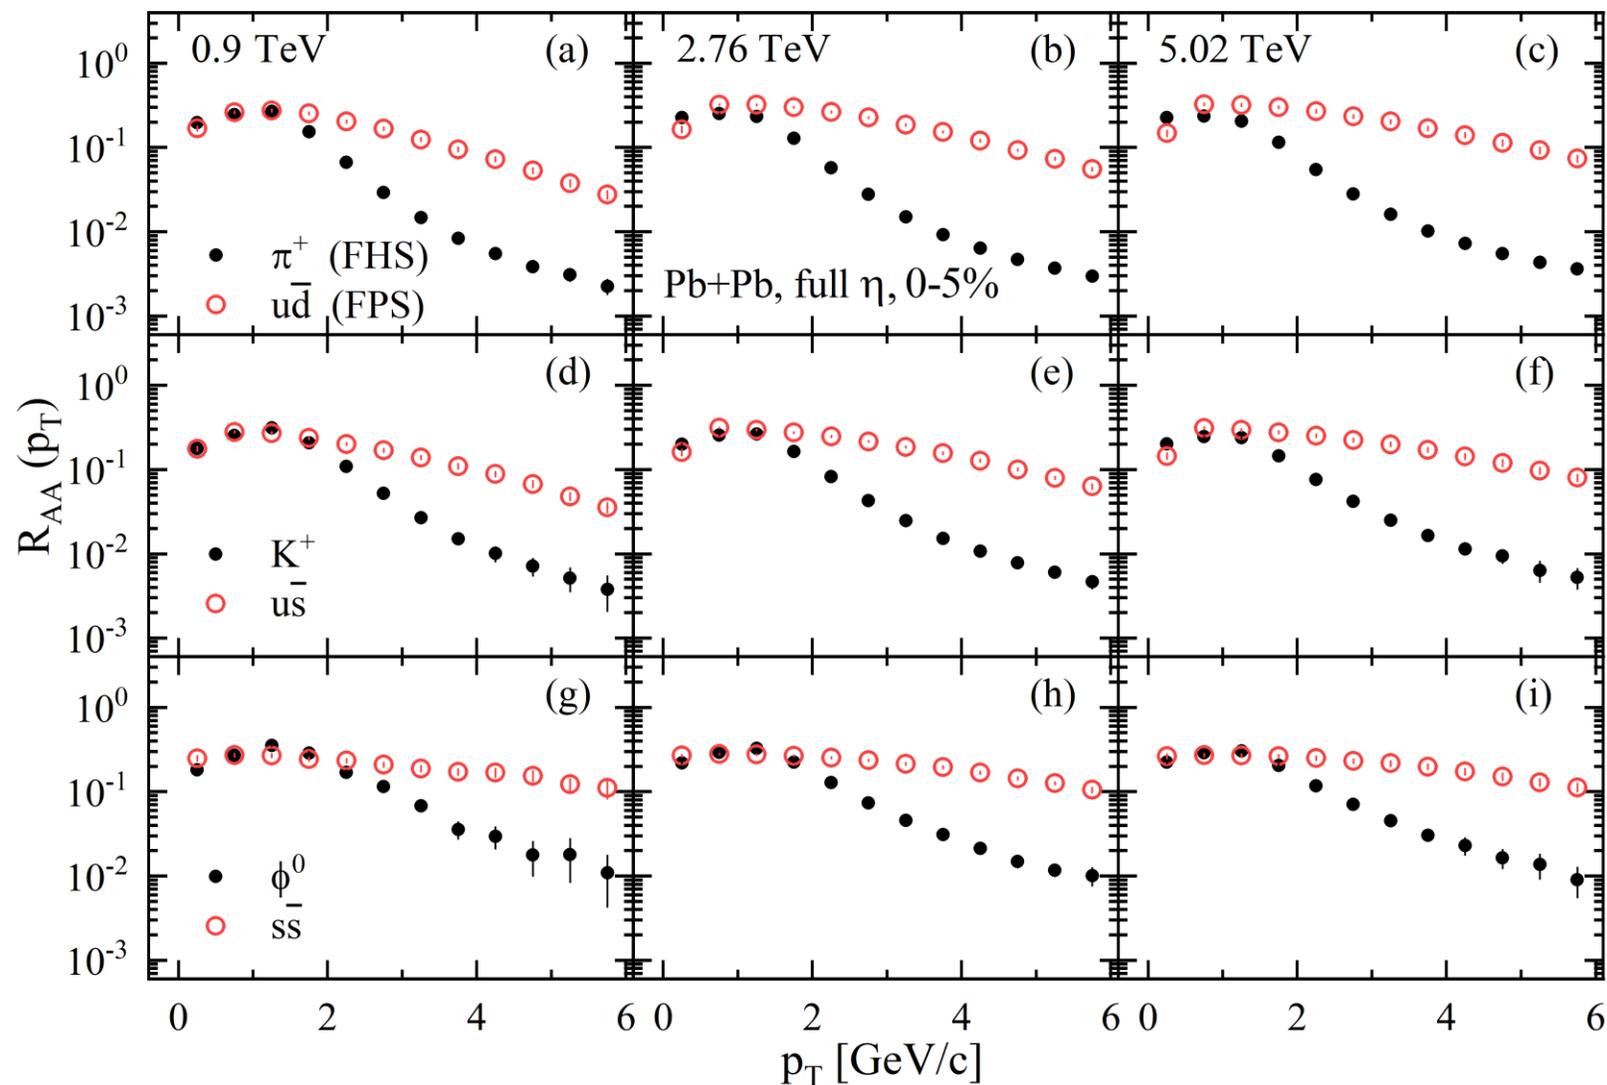

- Show the correspondence from central to peripheral collisions.
- $R_{AA}$ : peripheral  $>$  central, stemming from the stronger hot medium effect.

# Results: centrality dependence

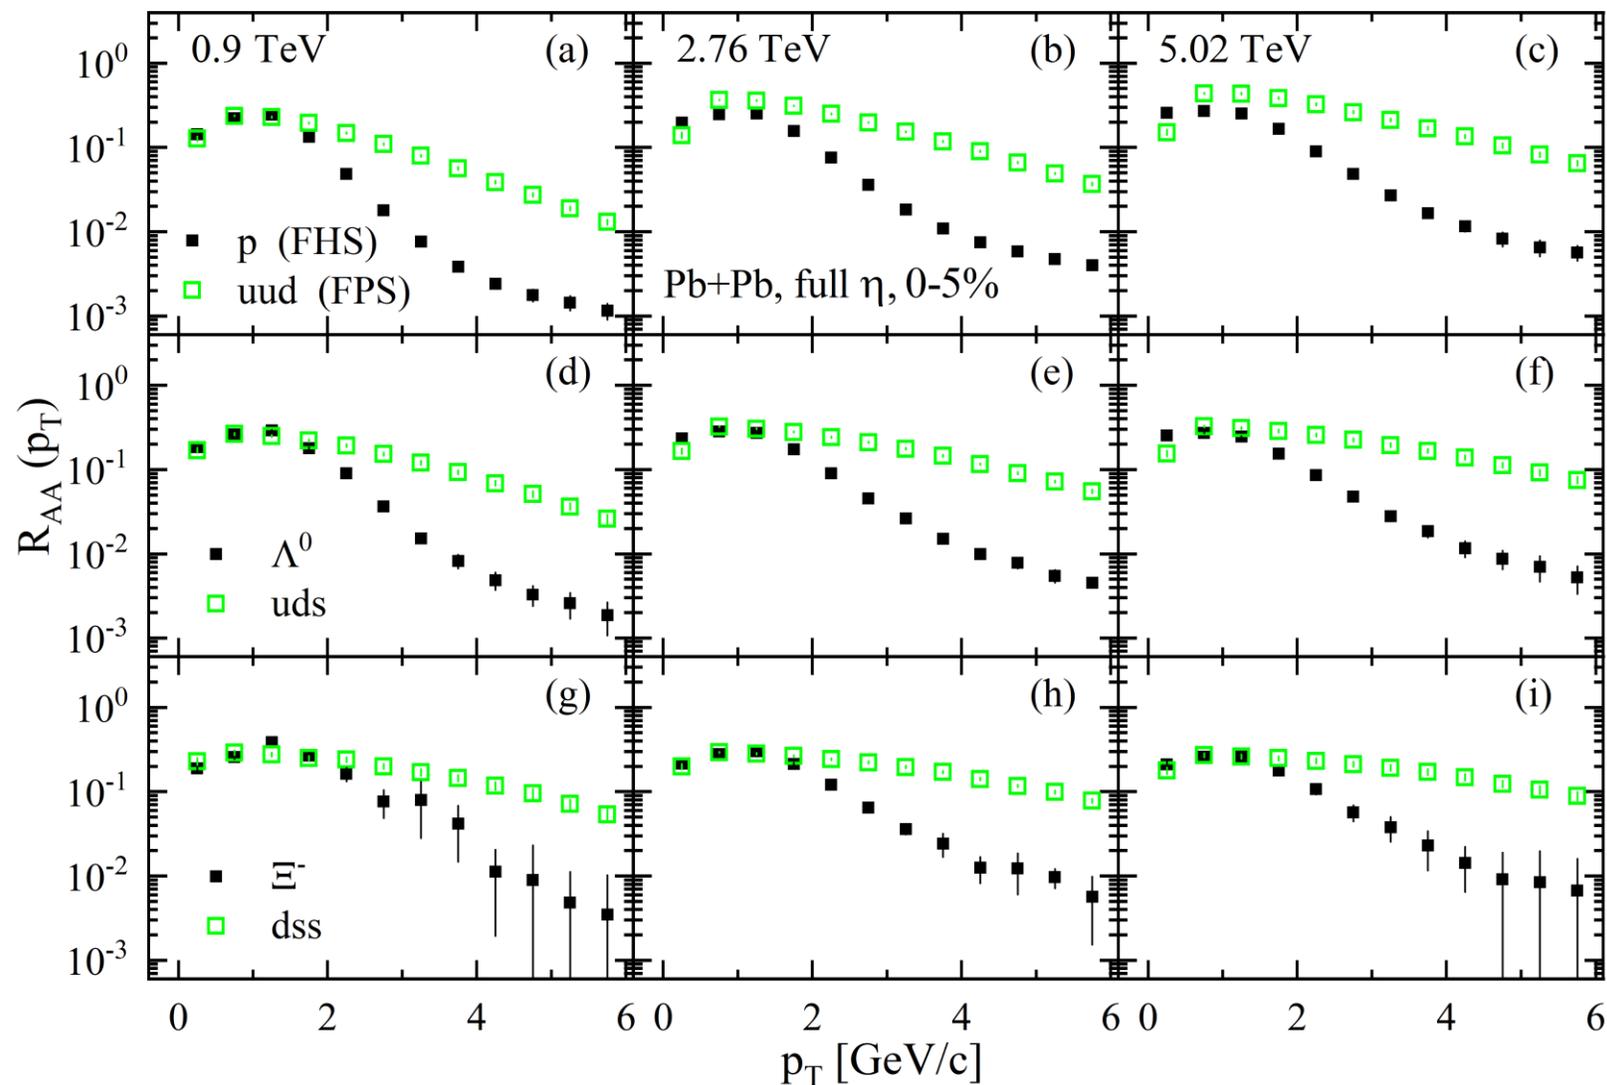

- Show the correspondence from central to peripheral collisions.
- $R_{AA}$ : peripheral  $>$  central, stemming from the stronger hot medium effect.

# Results: energy dependence

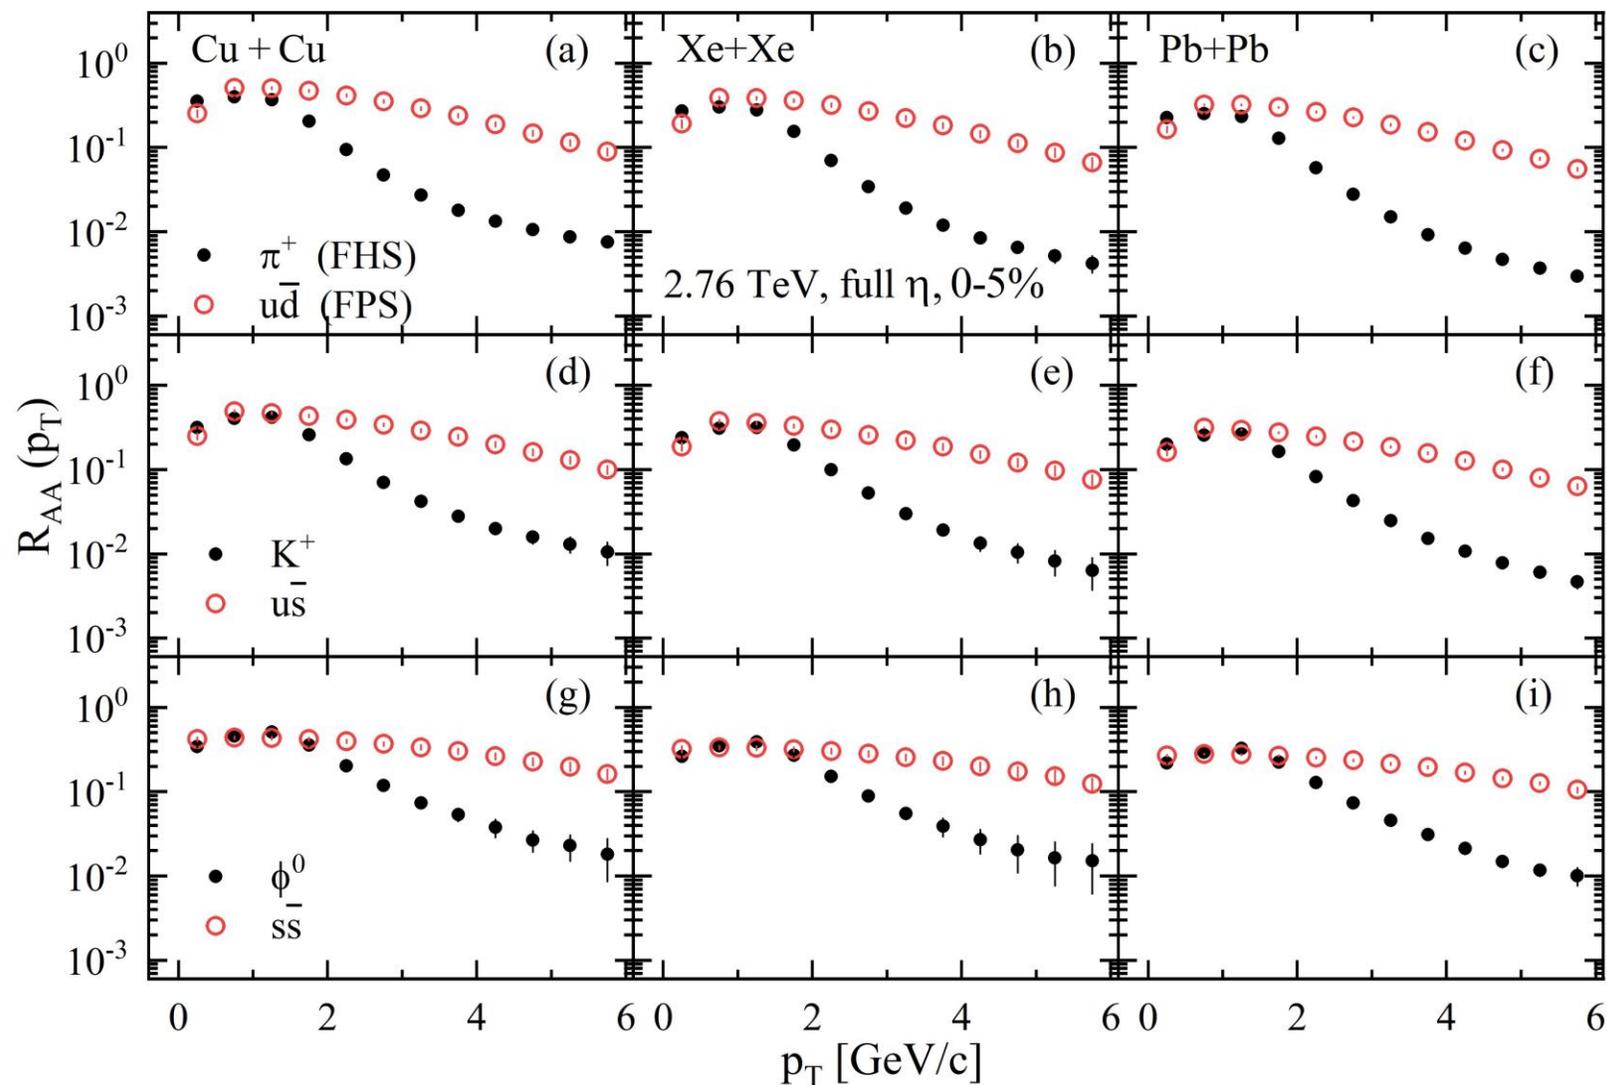

- $R_{AA}^{h-q} > R_{AA}^h$  above  $p_T \sim 2$  GeV/c.
- The correspondence is kept well from higher to “lower” energies.

# Results: energy dependence

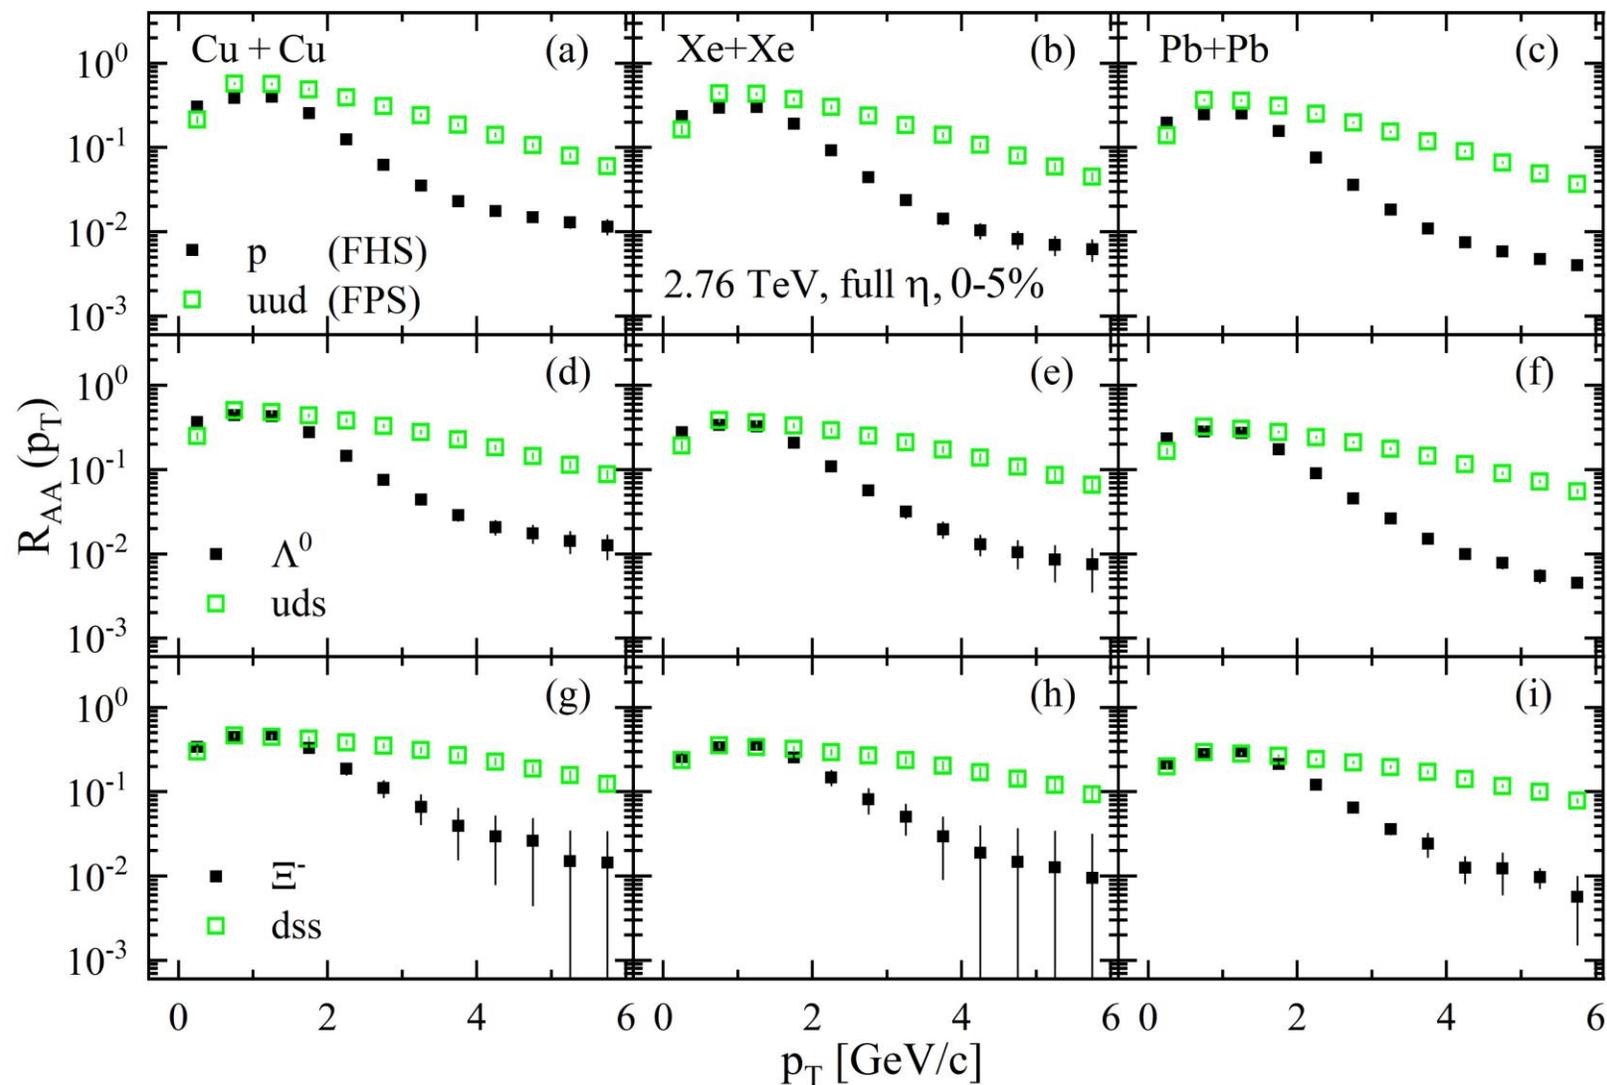

- $R_{AA}^{h-q} > R_{AA}^h$  above  $p_T \sim 2$  GeV/c.
- The correspondence is kept well from higher to “lower” energies.

# Results: system dependence

- Still,  $R_{AA}^{h-q} > R_{AA}^h$   
above  $p_T \sim 2 \text{ GeV}/c$ ,  
irrespective of the collision  
system size.

# Results: system dependence

- Still,  $R_{AA}^{h-q} > R_{AA}^h$   
above  $p_T \sim 2$  GeV/c,  
irrespective of the collision  
system size.

# Results: flavor (mass) ordering

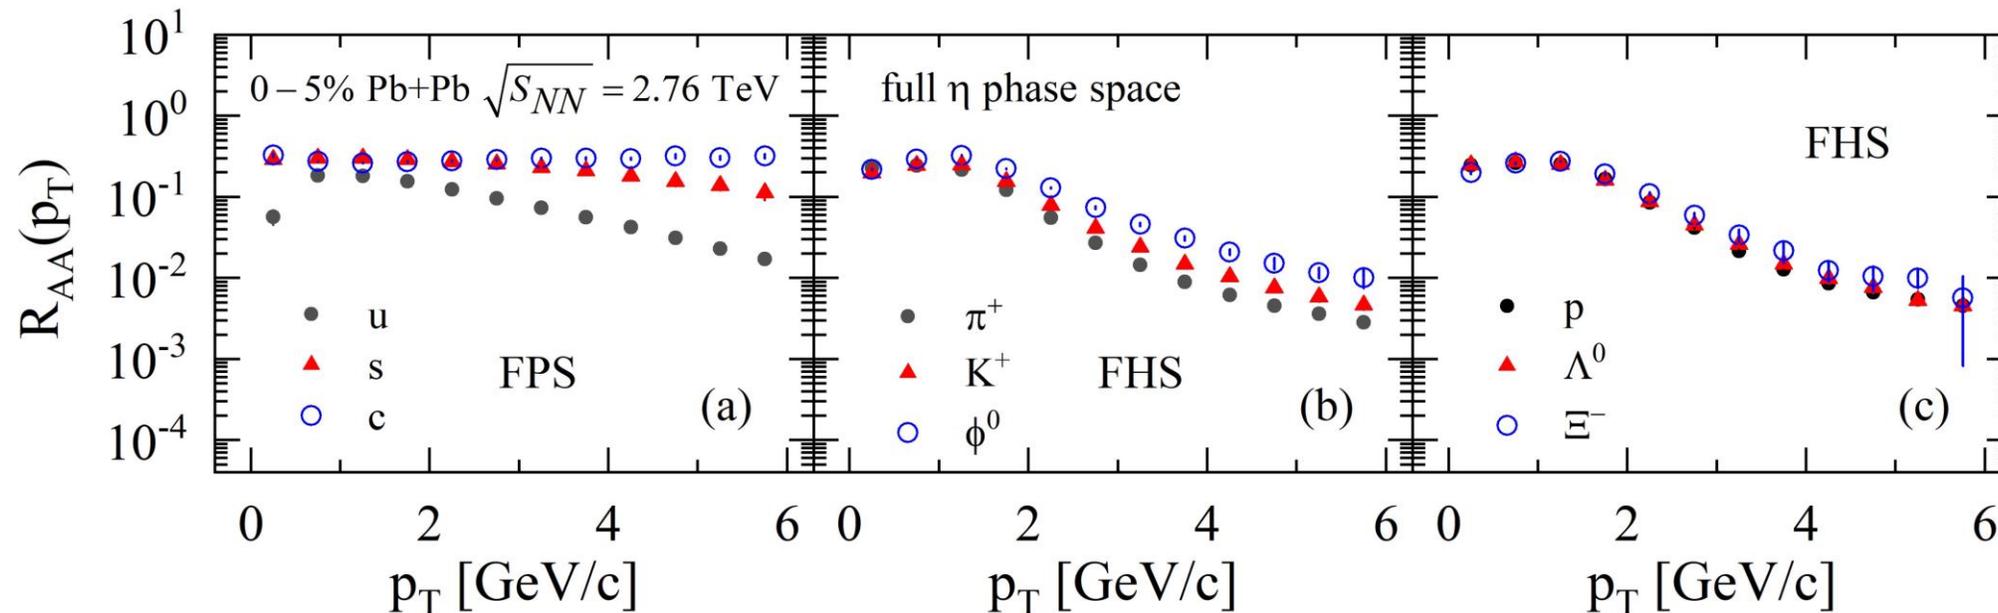

The dead-cone effect:  $\Theta \lesssim m/E$

See Wei Dai's talk on 08/09/2022

The mass ordering in energy loss and  $R_{AA}$ :

$$\Delta E(g) > \Delta E(u) > \Delta E(s) > \Delta E(c) > \Delta E(b) > \Delta E(t)$$

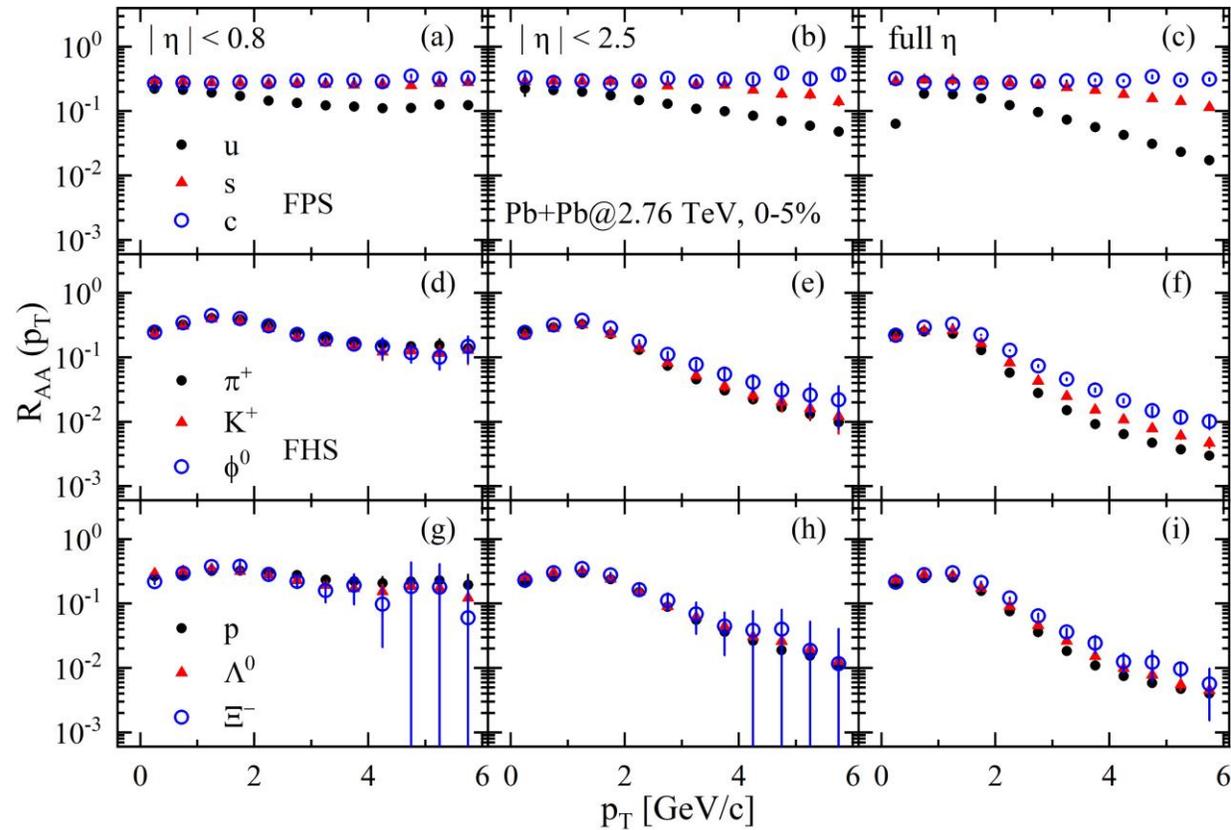

$$R_{AA}^g < R_{AA}^u < R_{AA}^s < R_{AA}^c < R_{AA}^b < R_{AA}^t$$

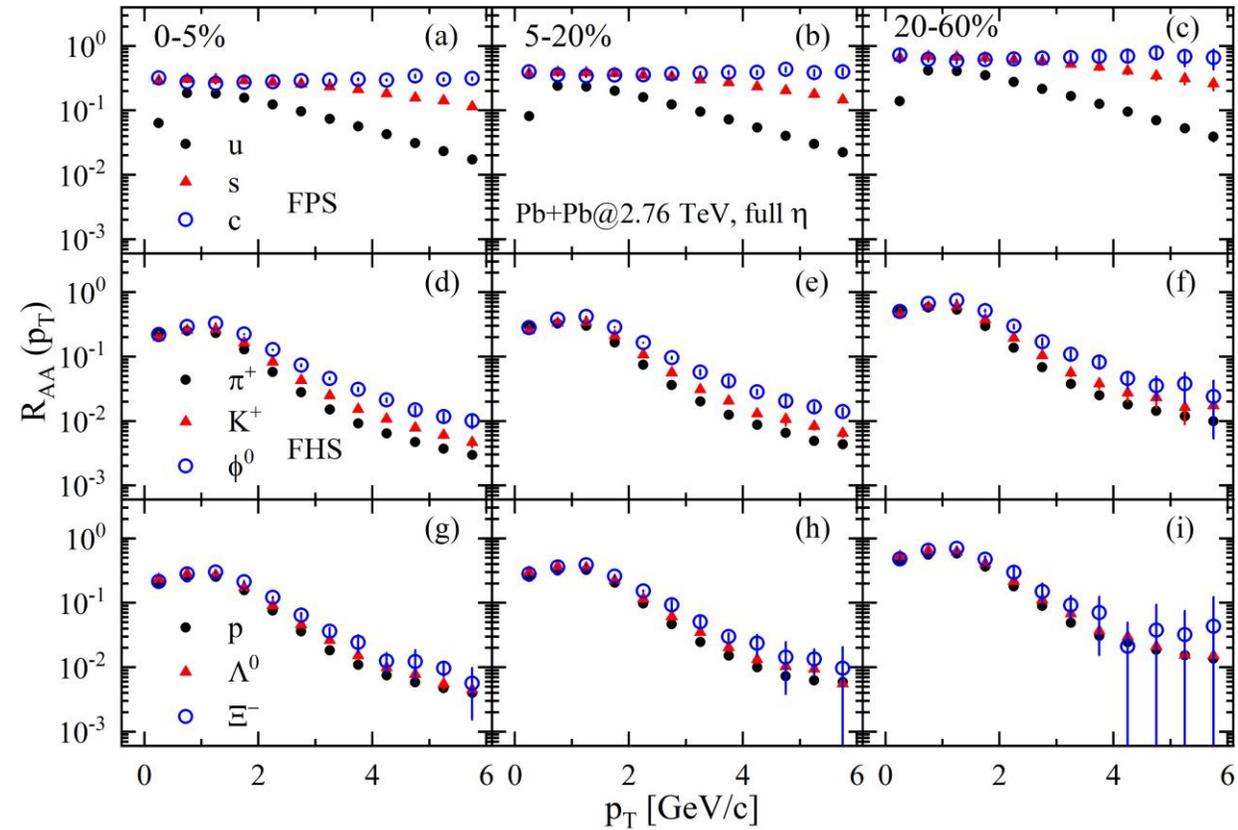

- We proposed a method connecting the  $R_{AA}$  between the hadron and its quark component (correspondence).
- A systematic study was given in the frame of PACIAE.  
 $\eta$ , centrality, energy and system...
- The correspondence and the mass ordering are held globally.
- The mass ordering in other observables ?
- More studies are still needed...

*Thanks !*

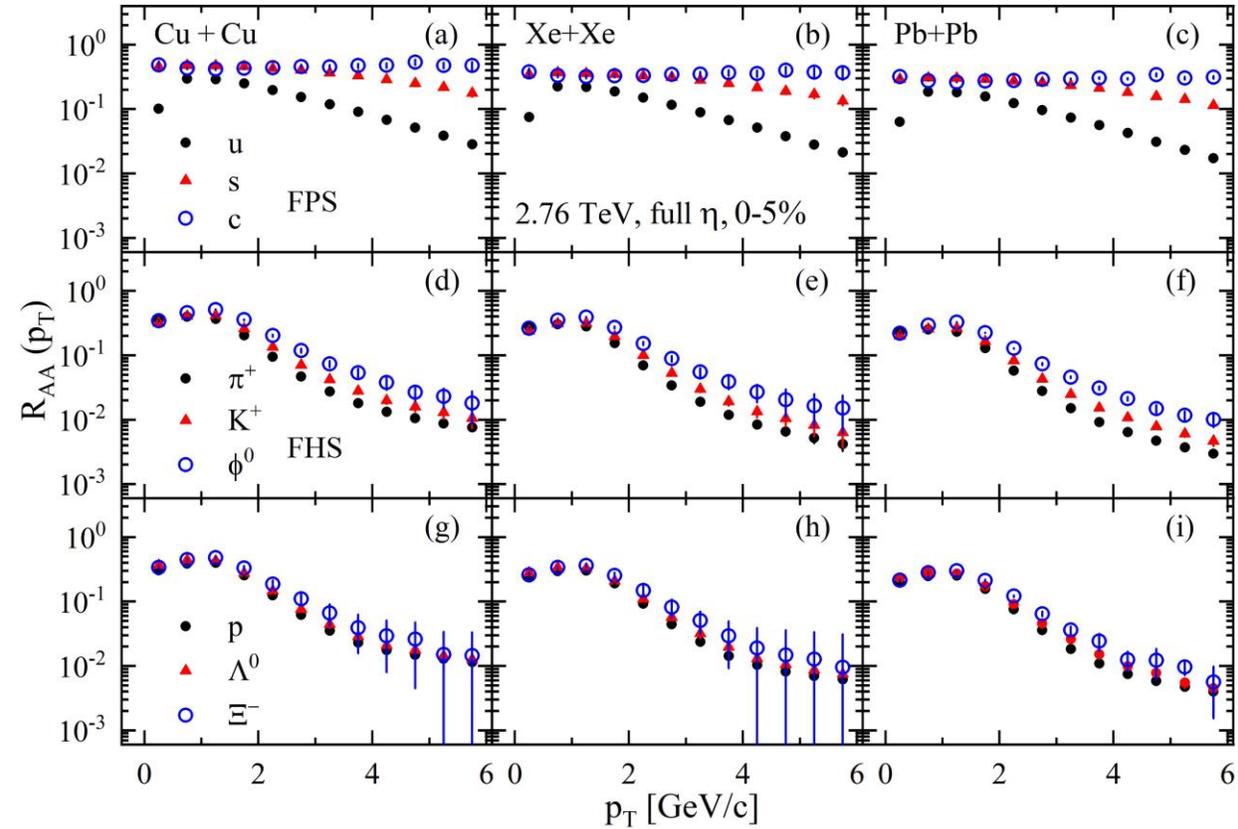

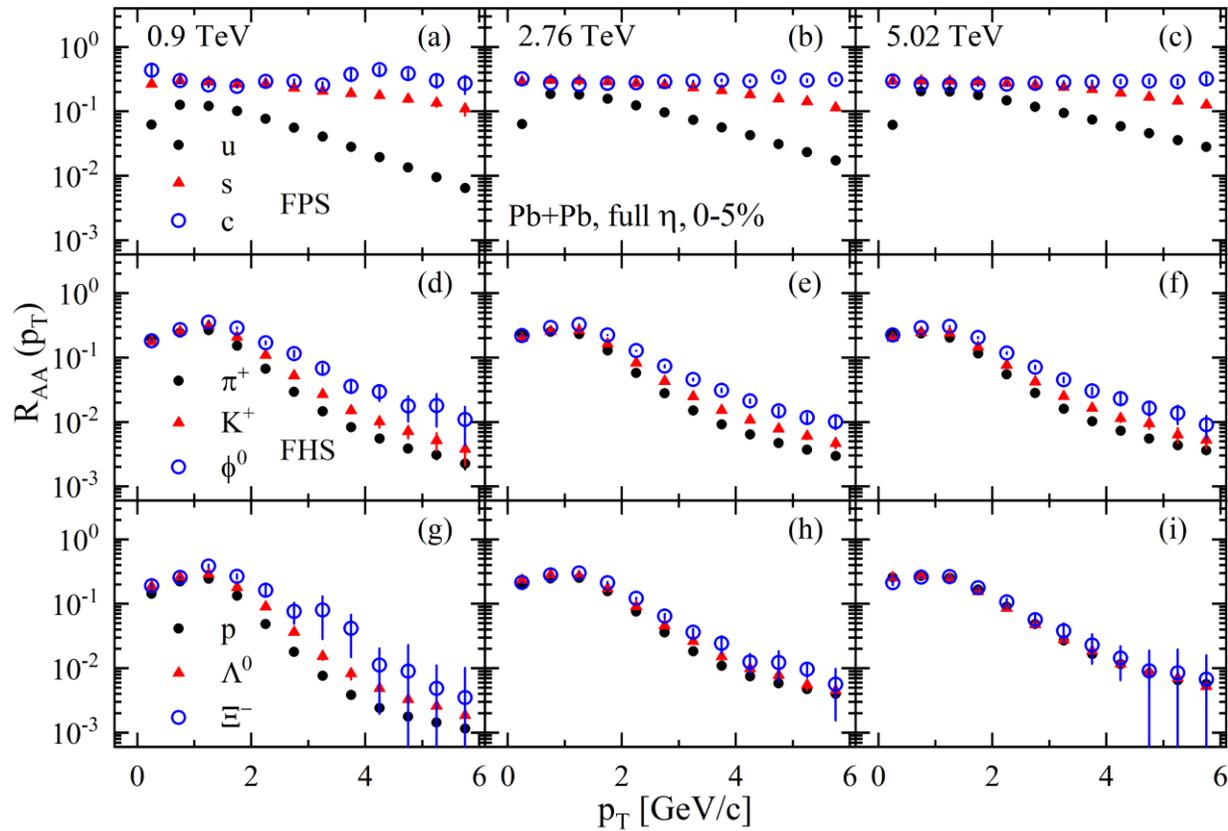

# Results: flavor (mass) ordering

- The flavor (mass) ordering is kept well in hadrons, same as that in quarks, which inspired from “dead-cone effect”.

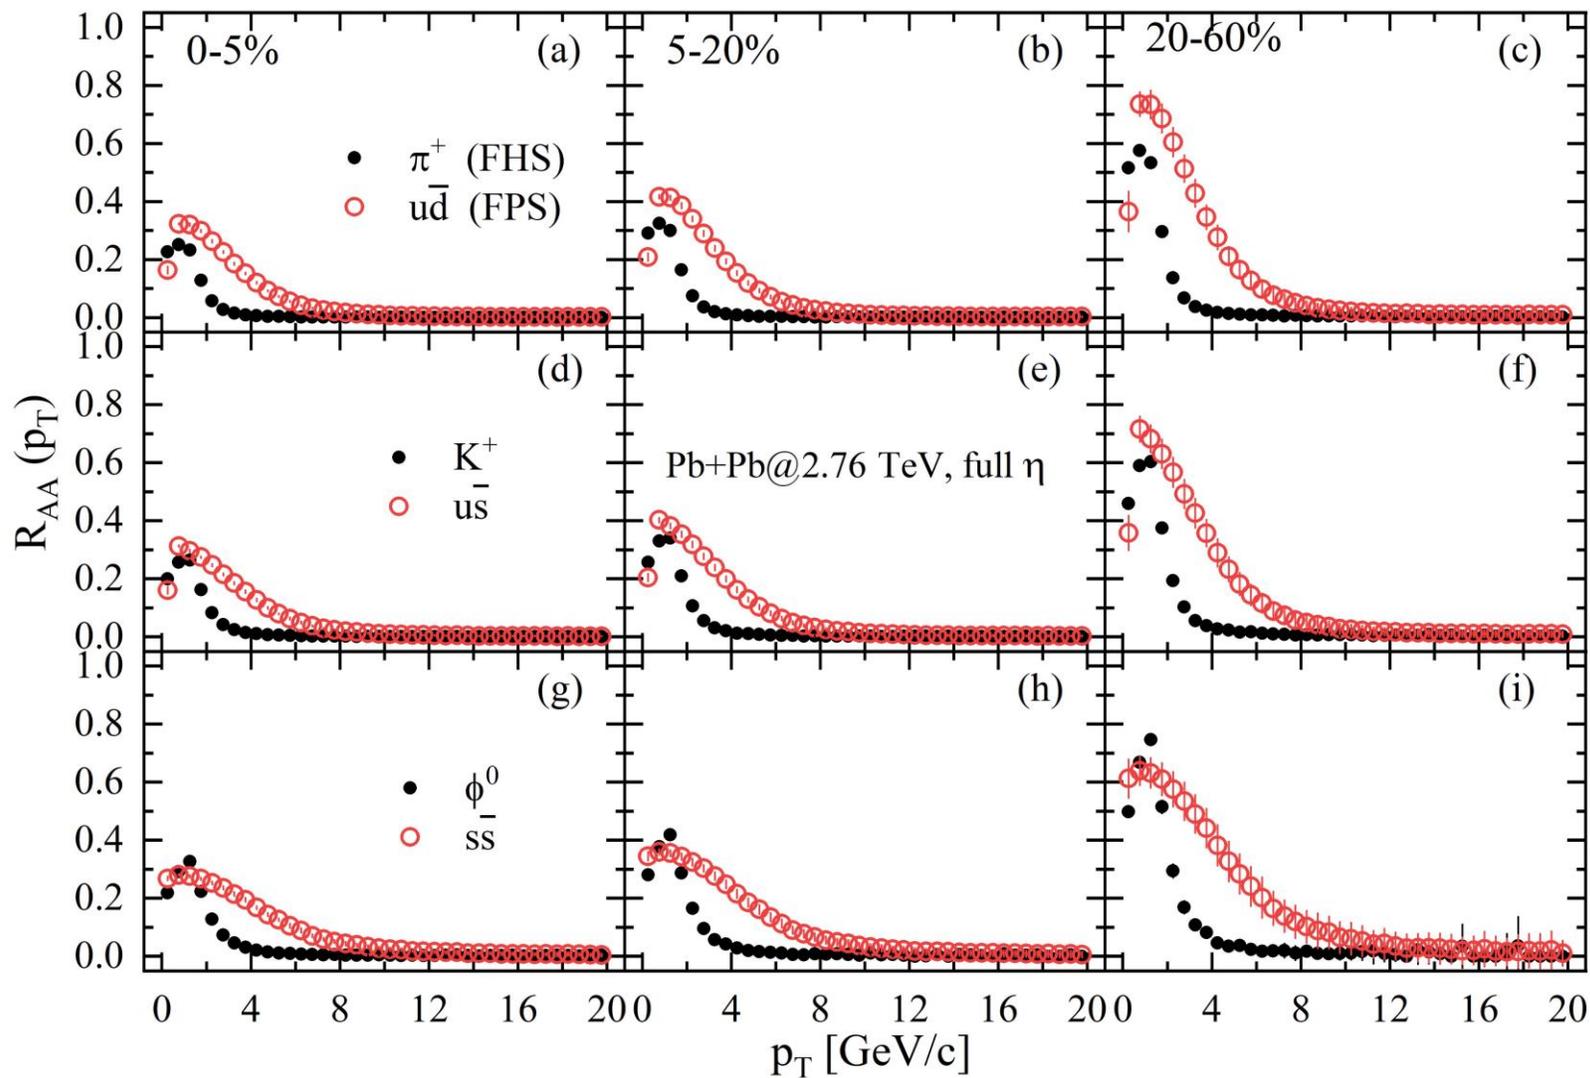

# Results: flavor (mass) ordering

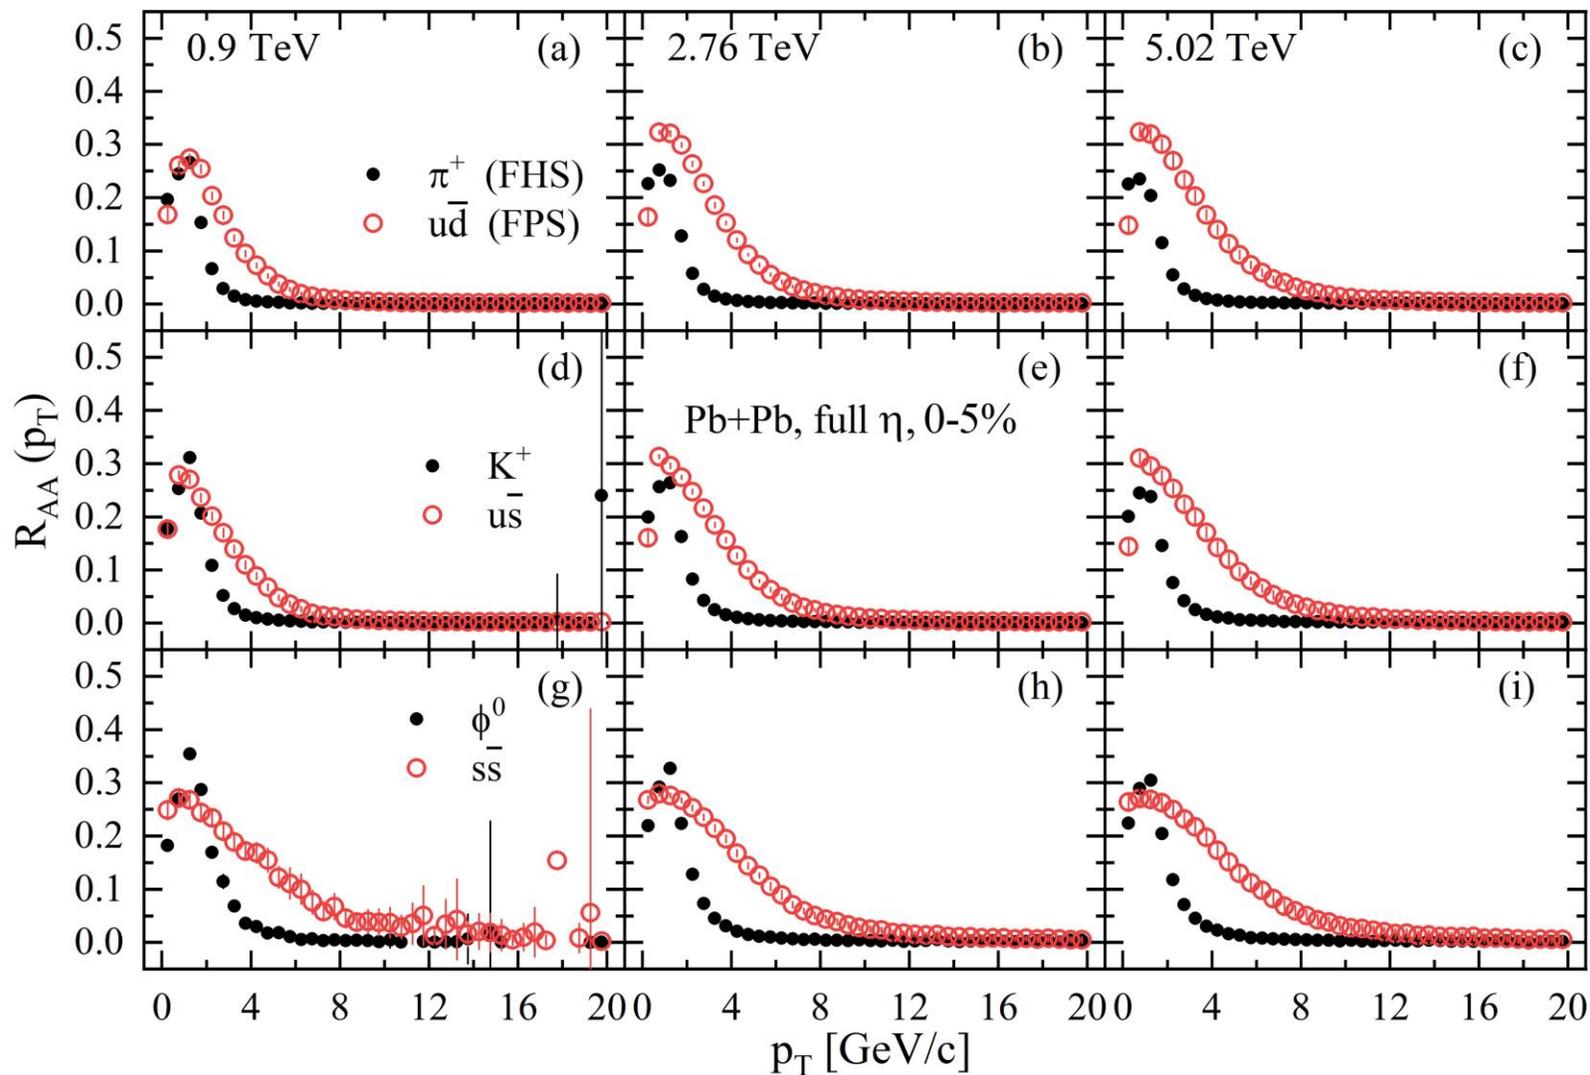

- The flavor (mass) ordering is kept well in hadrons, same as that in quarks, which inspired from “dead-cone effect”.
