- $W$  mass
- LFU
- ...

# Naturalness problem for the electron

## Classical description of electron

Borrowed from Hitoshi Murayama, hep-ph/0002232

electron

Physical mass    Bare mass    electrostatic self-energy

$$m_e = m_0 + \delta m, \quad \delta m = \frac{q^2}{4\pi r_0}$$

No structure of electron:  $r_0 < 10^{-19}\text{m}$

$$m_p \sim 1 \text{ GeV} \sim 10^{-16}\text{m}$$

$$0.5 = -9999.5 + 10000. \quad \text{MeV}$$

Large cancellation is needed, unnatural in the classical electromagnetism

# Solution to naturalness problem of the electron

Problem solved by Dirac

Particles get doubled

Quantum Electrodynamics(QED)  $\longrightarrow$  **Existence of the positron**

The correction:

$$\overset{\text{Physical mass}}{m_e} = \overset{\text{Bare mass}}{m_0} + \overset{\text{self-energy}}{\delta m}, \quad \delta m = \frac{3q^2}{4\pi} m_0 \log \frac{1}{m_0 r_0}$$

log dependence

Even if  $r_0 = l_{pl} = 10^{-34}m$ , the correction is only few percent

# Naturalness problem for the Higgs

Much larger cancelation is needed, not natural

# Solutions to naturalness problem

## Supersymmetry

Quadratic divergence becomes log

Particle number get doubled

$$\delta m^2 = M_{pl}^2 \rightarrow M_{SUSY}^2 \log M_{pl}/M_{SUSY}$$

**All predict new particles at around TeV scale!**

## Extra dimension

$M_{pl}$  is low (TeV) in extra dimension

## Composite Higgs

Higgs is not fundamental

# Alternatives: cosmological selection of the electroweak scale

**Anomalies in Physical Cosmology**

Phillip James E. Peebles

The  $\Lambda$ CDM cosmology passes demanding tests that establish it as a good approximation to reality. The theory is incomplete, of course, and open issues are being examined in active research programs. I offer a review of less widely discussed anomalies that might also point to hints to a still better cosmological theory if more closely examined.

This anomaly may be an evidence of the axion dark matter!

- SU(2) Triplet scalars around TeV
- Achieving gauge unification
- Easily probed at the LHC

- Many problems require new physics beyond SM
- Colliders are still one of the most powerful tools to probe new physics
- So many new physics models, we need experimental data to point out the direction

“The more I learn, the more I realize how much I don't know.”

— Albert Einstein
