Standard Model Total Production Cross Section Measurements

Status: May 2020

Why we need the New Physics?

Some open questions:

1. What is **Dark Matter** ?
2. What is the origin of the **neutrino mass**?
3. What is the nature of the **electroweak symmetry breaking**?
4. What is the nature of the **Higgs boson (Composite or elementary particle)**?
5.

New Physics Models and new measurements to answer these questions

The New Physics Signals?

1. W-boson mass? 7σ

CDF, Science 376(2022)6589

2. Muon g-2? 4.2σ

PRL126(2021)14,141801

3. Strong coupling? $\sim 4\sigma$

PDG2020

G. Bell, C. Lee, Y. Makris, J. Talbert and Bin Yan, in preparation

4. Forward-backward asymmetry of bottom quark @ LEP

PDG2020 2.1σ

5. Anomaly of B physics

Status of Zbb couplings

Excluded by off-Z pole data

$$\mathcal{L} = \bar{b}\gamma_\mu(\kappa_V g_V - \kappa_A g_A \gamma_5)bZ_\mu$$

- Large deviation of the Zbb coupling
- The **degeneracy** of the Zbb coupling

Status of Zbb couplings

A. How to **break the degeneracy** of the Zbb coupling?

New experiments: CEPC (e+e- collider), etc.

B. How to **explain** the LEP data?

New Physics?

Many new physics models

e.g. Custodial symmetry + heavy B' quark

K. Agashe, R. Contino, L. Rold, A. pomarol, 2006'

Statistical Fluctuation or Systematic error?

New experiments: e.g. CEPC

So...

Should we just wait for the next generation lepton colliders?

Any possibility from LHC and ep colliders (HERA and EIC)?

In 2020, The United States Department of Energy announced that an **EIC will be built over the next ten years at Brookhaven National Laboratory**

Charge conjugation invariance

$$\mathcal{L} = \bar{b}\gamma_\mu(\kappa_V g_V - \kappa_A g_A \gamma_5)bZ_\mu$$

➡ Only **axial-vector components** contribute to the cross section

Isospin symmetry

➡ Massless quark doublet will vanish, only **top and bottom** quarks can contribute to the scattering

Goldstone boson equivalence theorem

➡ The **polarization of Z boson** is different from quark initial state

Bottom quark's contribution is comparable to the top quark, i.e. $\sigma(b)/\sigma(t) \simeq 1.1$

Break the Zbb coupling degeneracy

Current Zh data could break the degeneracy

$$\mathcal{L} = \frac{g_W}{2c_W} \bar{b} \gamma_\mu (\kappa_v^b g_V^{b,SM} - \kappa_a^b g_A^{b,SM} \gamma_5) b Z_\mu$$

Summary

- A. We proposed four different new methods to probe the Zbb coupling at the LHC and ep colliders;
- B. The **Zh data** at the 13 TeV LHC can **resolve the apparent degeneracy** of the Zbb coupling;
- C. Zh cross section, exclusive Z boson decay at the **LHC** and WSSA at the **EIC** depend on the **axial-vector** Zbb coupling, while the SSA in **HERA or EIC** is sensitive to **the vector** Zbb coupling;
- D. It is hopeful to **verify or exclude** the LEP measurement by those new methods.

Thank you!
