

# Axial current renormalization and non-decoupling mass logarithms

陈龙

山东大学物理学院

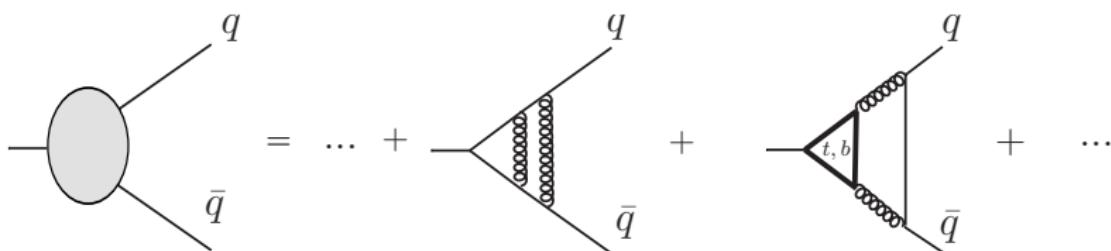

第二届微扰量子场论研讨会

杭州 2022 年 8 月 22 – 24 日

Based on: [LC, M.Czakon 2201.01797, 2112.03795]  
[LC, M.Czakon, M.Niggetiedt 2109.01917]  
[T.Ahmed, LC, M.Czakon 2101.09479]

# Quark form factors in QCD

$$\bar{u}(p_1) \Gamma^\mu v(p_2) = \bar{u}(p_1) (\textcolor{blue}{v}_q F^V \gamma^\mu + \textcolor{red}{a}_q F^A \gamma^\mu \gamma_5) v(p_2)$$

- Important objects in Precision Physics

- $e^+e^- \rightarrow Z/\gamma^* \rightarrow Q\bar{Q} + X, H/Z \rightarrow Q\bar{Q} + X$ , Drell-Yan, DIS etc
- simplest objects to extract certain universal QCD quantities

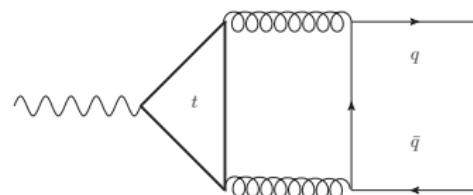

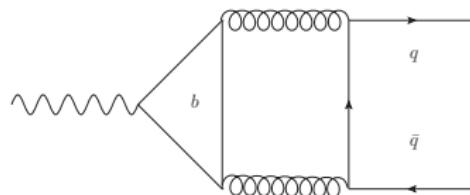

- Start-of-art results in QCD:

- Massless**: 4-loop analytically [Lee, Manteuffel, Schabinger, Smirnov, Smirnov, Steinhauser 22]
- Massive**: Truncated series-expansion at 3-loop [Fael, Lange, Schönwald, Steinhauser 22].

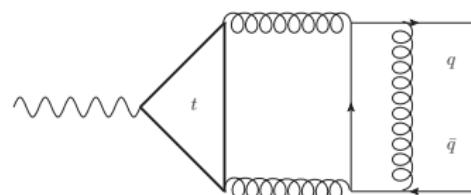

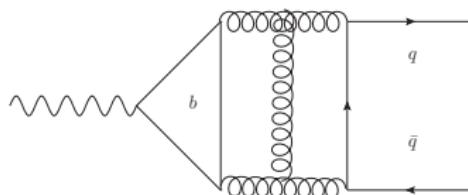

- The **axial** part is not yet complete ...

# Singlet-type contributions

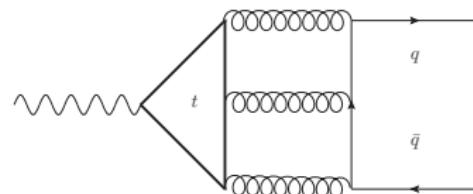

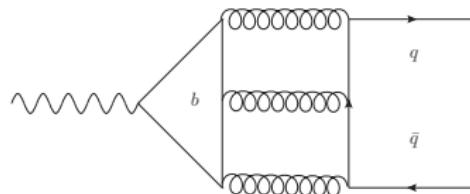

- Axial 2-loop:

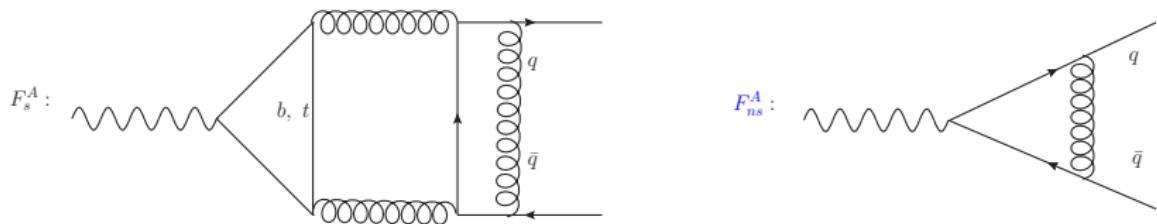

- Axial 3-loop:

- Vector 3-loop:

# UV-renormalization of singlet FFs

UV renormalization for **individual** singlet contributions [Chetyrkin, Kühn 93; LC, Czakon, Niggetiedt 21]

$$F_{s,b}^A(a_s, m_t, \mu) = Z_{ns} Z_2 F_{s,b}^A(\hat{a}_s, \hat{m}_t) + Z_s Z_2 \left( F_{ns}^A(\hat{a}_s, \hat{m}_t) + \sum_{i=1}^{n_f} F_{s,i}^A(\hat{a}_s, \hat{m}_t) \right),$$

$$F_{s,t}^A(a_s, m_t, \mu) = Z_{ns} Z_2 F_{s,t}^A(\hat{a}_s, \hat{m}_t) + Z_s Z_2 \left( F_{ns}^A(\hat{a}_s, \hat{m}_t) + \sum_{i=1}^{n_f} F_{s,i}^A(\hat{a}_s, \hat{m}_t) \right),$$

- $Z_J \bar{\psi} \gamma^\mu \gamma_5 \psi$  with a *non-anticommuting*  $\gamma_5$ :  $Z_J = Z_{ns} + n_j Z_s$ .

For the **total non-anomalous** combination:

$$F_{s,b}^A(a_s, m_t) - F_{s,t}^A(a_s, m_t) = Z_{ns} Z_2 (F_{s,b}^A(\hat{a}_s, \hat{m}_t) - F_{s,t}^A(\hat{a}_s, \hat{m}_t)),$$

# Practical applications of singlet $\bar{\psi}\gamma^\mu\gamma_5\psi$

---

- Quantities related to the *global/external* anomalies  
e.g.  $\pi \rightarrow \gamma\gamma$  decay [Steinberger 49; Sutherland, Veltman 67; Adler 69; Bell, Jackiw 69]
- Treatment of the singlet axial-current operator in heavy-top EFT [Chetyrkin, Kühn 91 93; LC, Czakon, Niggetiedt 21]
- Appearance of the *non-decoupling* heavy-quark-mass logarithms in perturbation theory [Collins, Wilczek, Zee 78; Chetyrkin, Kühn 93; LC, Czakon 22]
- Polarized structure and splitting functions [Matiounine, Smith, Neerven; Moch, Vermaseren, Vogt; Blümlein, Marquard, Schneider, Schönwald; Tarasov, Venugopalan...]
- .....

# The $\gamma_5$ prescription in use

The HV/BM [72,79] prescription of  $\gamma_5$  in dimensional regularization:

$$\gamma_5 = \frac{i}{4!} \epsilon_{\mu\nu\rho\sigma} \gamma^\mu \gamma^\nu \gamma^\rho \gamma^\sigma$$

$$\gamma_\mu \gamma_5 \rightarrow \frac{1}{2} (\gamma_\mu \gamma_5 - \gamma_5 \gamma_\mu) = \frac{i}{6} \epsilon_{\mu\nu\rho\sigma} \gamma^\nu \gamma^\rho \gamma^\sigma,$$

where the  $\epsilon^{\mu\nu\rho\sigma}$  is treated outside the  $R$ -operation formally in D dimensions [Larin, Vermaseren 91; Zijlstra, Neerven 92] (Larin's prescription).

The properly renormalized singlet axial current reads

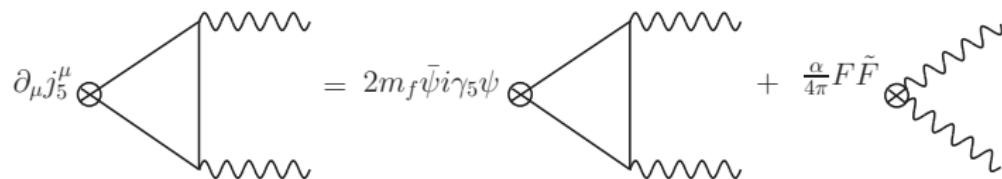

$$\begin{aligned} [J_5^\mu]_R &= Z_J \bar{\psi}_B \gamma^\mu \gamma_5 \psi_B \\ &= Z_5^f Z_5^{ms} \bar{\psi}_B \frac{-i}{3!} \epsilon^{\mu\nu\rho\sigma} \gamma_\nu \gamma_\rho \gamma_\sigma \psi_B \end{aligned}$$

# The Adler-Bell-Jackiw anomaly

The anomalous axial-vector divergence equation [Adler 69; Bell, Jackiw 69]

$$\partial_\mu \bar{\psi} \gamma^\mu \gamma_5 \psi = 2m_f \bar{\psi} i\gamma_5 \psi - \frac{\alpha}{4\pi} \epsilon^{\mu\nu\rho\sigma} F_{\mu\nu} F_{\rho\sigma}.$$

Diagrammatically,

The Adler-Bardeen theorem [Adler, Bardeen 69] : “one-loop” exact

# Operator mixing under renormalization

The all-order axial-anomaly equation [Adler 69; Adler, Bardeen 69]

$$[\partial_\mu J_5^\mu]_R = a_s n_f \text{T}_F [F\tilde{F}]_R$$

with  $F\tilde{F} \equiv -\epsilon^{\mu\nu\rho\sigma} F_{\mu\nu}^a F_{\rho\sigma}^a$  in QCD with  $n_f$  massless quarks.

- The renormalization of the operators involved: [Adler 69; Espriu,Tarrach 82; Breitenlohner,Maison,Stelle 84;  
Bos 92; Larin 93 ... ]

$$\begin{pmatrix} [\partial_\mu J_5^\mu]_R \\ [F\tilde{F}]_R \end{pmatrix} = \begin{pmatrix} Z_J & 0 \\ Z_{F\tilde{F}} & Z_{F\tilde{F}} \end{pmatrix} \cdot \begin{pmatrix} [\partial_\mu J_5^\mu]_B \\ [F\tilde{F}]_B \end{pmatrix}$$

- with the matrix of *anomalous dimensions*:

$$\frac{d}{d \ln \mu^2} \begin{pmatrix} [\partial_\mu J_5^\mu]_R \\ [F\tilde{F}]_R \end{pmatrix} = \begin{pmatrix} \gamma_S & 0 \\ \gamma_{F\tilde{F}} & \gamma_{F\tilde{F}} \end{pmatrix} \cdot \begin{pmatrix} [\partial_\mu J_5^\mu]_R \\ [F\tilde{F}]_R \end{pmatrix}$$

# Vacuum-Gluon matrix element (AVV diagram)

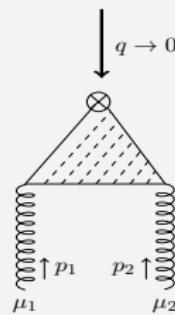

Determine  $Z_5$  via computing the 2-gluon matrix elements of  $[\partial_\mu J_5^\mu]_R = a_s n_f T_F [F\bar{F}]_R$

$$\Gamma_{lhs}^{\mu\mu_1\mu_2}(p_1, p_2) \equiv \int d^4x d^4y e^{-ip_1 \cdot x - iq \cdot y} \langle o | \hat{T} \left[ J_5^\mu(y) A_a^{\mu_1}(x) A_a^{\mu_2}(o) \right] | o \rangle |_{amp}$$

**Form factor decomposition:**

$$\begin{aligned}\Gamma_{lhs}^{\mu\mu_1\mu_2}(p_1, p_2) &= F_1 \epsilon^{\mu\mu_1\mu_2(p_2-p_1)} \\ &+ F_2 (p_1^{\mu_1} \epsilon^{\mu\mu_2 p_1 p_2} - p_2^{\mu_2} \epsilon^{\mu\mu_1 p_1 p_2}) \\ &+ F_3 (p_1^{\mu_2} \epsilon^{\mu\mu_1 p_1 p_2} - p_2^{\mu_1} \epsilon^{\mu\mu_2 p_1 p_2})\end{aligned}$$

$$q_\mu \Gamma_{lhs}^{\mu\mu_1\mu_2}(p_1, p_2) = 2F_1 \epsilon^{\mu_1\mu_2 p_1 p_2}$$

taking into account the odd parity and Bose symmetry w.r.t gluons ( $p_1 \leftrightarrow p_2, \mu_1 \leftrightarrow \mu_2$ ).

# The non-Abelian Adler-Bardeen theorem

The equality verified to 4-loop in QCD [Ahmed, LC, Czakon 21]:

$$Z_{F\tilde{F}} = Z_{a_s}$$

The ABJ equation in QCD in terms of the *bare* fields:

$$(Z_J - n_f T_F a_s Z_{FJ}) [\partial_\mu J_5^\mu]_B = \hat{a}_s n_f T_F [F\tilde{F}]_B$$

- In an Abelian theory with Pauli-Villar regularization (with an AC  $\gamma_5$ ), the **coefficient** is 1 to all orders [Adler 69; Adler, Bardeen 69]
- The **coefficient is not 1** with a NAC  $\gamma_5$  in DR in QCD, but the LHS current remains **RG-invariant** (albeit in D=4 limit):

$$\gamma_{F\tilde{F}} = -\mu^2 \frac{d \ln a_s}{d \mu^2} = -\beta, \quad \gamma_S|_{\epsilon=0} = n_f T_F a_s \gamma_{FJ}.$$

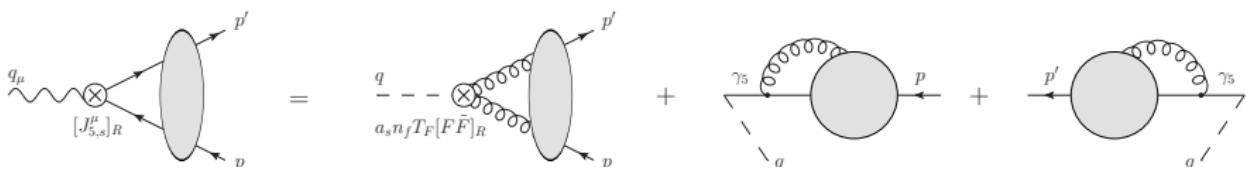

- An all-order argument of the non-Abelian extension was sketched [Breitenlohner, Maison, Stelle 84]; A proof is completed only recently [Lüscher, Weisz 21]
- However,  $Z_J = Z_5^f Z_5^{ms}$  needs to be computed order by order ...  
 $Z_5^f$  at  $\mathcal{O}(a_s^3)$  from 4-loop AVV-amplitude [Ahmed, LC, Czakon 21]

# Vacuum-Quark matrix element and AWTI

Much more efficient to extract  $Z_J$  by using the off-shell Ward-Takahashi identity for an axial current with a non-anticommuting  $\gamma_5$  [LC,Czakon 21]

The anomalous Ward-Takahashi identity:

$$q_\mu \Gamma_{5,s}^\mu(p', p) = -a_s n_f T_F \Lambda(p', p) + \gamma_5 \hat{S}^{-1}(p) + \hat{S}^{-1}(p') \gamma_5,$$

- $q$  can not be 0 to have a non-zero anomaly
- Either  $p'$  or  $p'$  should be 0 to reduce to the propagator-type integrals
- $\gamma_5$  on the RHS does not require any renormalization!

# $Z_5^{ms}$ up to $\mathcal{O}(a_s^5)$ from 4-loop calculations

- The anomalous dimension of  $[J_5^\mu]_R$ :

$$\begin{aligned}\gamma_s &\equiv \frac{d \ln Z_J}{d \ln \mu^2} = \frac{d \ln Z_s^{ms}}{d \ln \mu^2} + \frac{d \ln Z_s^f}{d \ln \mu^2} \\ &= \gamma_s^{ms} + \beta \frac{d \ln Z_s^f}{d \ln a_s} - \epsilon \frac{d \ln Z_s^f}{d \ln a_s}.\end{aligned}$$

- $Z_5^{ms}$  at  $\mathcal{O}(a_s^5)$  using ABJ equation with  $Z_{F\tilde{F}} = Z_{a_s}$

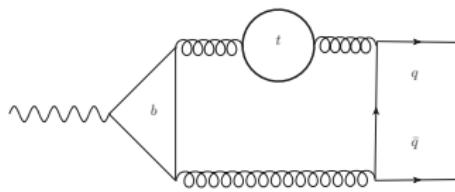

$$\gamma_s^{ms} = a_s n_f T_F \gamma_{FI} - \beta \frac{d \ln Z_s^f}{d \ln a_s}.$$

- $\gamma_s^{ms}$  at  $\mathcal{O}(a_s^5)$  requires only  $\gamma_{FI}$  and  $Z_s^f$  up to 4-loop (from AWTI) [LC, Czakon 21, 22]
- $Z_5^f$  at  $\mathcal{O}(a_s^5)$  not known yet

In this way, the  $\mathcal{O}(a_s^4)$  result for  $Z_s^{ms}$  could have been given in early 90s (along with Larin's  $\mathcal{O}(a_s^3)$  result).

# Light quark form factors in the heavy top limit

Appearance of the non-decoupling  $m_t$ -logarithms [Collins, Wilczek, Zee 78; Chetyrkin, Kühn 93]

$$\begin{aligned}\bar{\mathcal{F}}_{s,b}^{A,3}(m_t \rightarrow \infty) &= \bar{\mathcal{F}}_{s,b}^{\bar{A},3}(\mu) + \bar{\mathcal{F}}_{s,b}^{A_{\text{nDC}},3}(m_t, \mu), \\ &= \bar{\mathcal{F}}_{s,b}^{\bar{A},3}(\mu) - \frac{85}{9}C_F + \frac{4}{3}C_F L_\mu - \frac{1}{4}C_F L_\mu^2 + \mathcal{O}(1/m_t^2)\end{aligned}$$

where  $L_\mu \equiv \ln \frac{\mu^2}{m_t^2}$ .

A Wilson coefficient  $C_w(\bar{a}_s, \mu/m_t)$

$$\mathcal{F}_{s,b}^A - \mathcal{F}_{s,t}^A \Big|_{m_t \rightarrow \infty} = \bar{\mathcal{F}}_{s,b}^{\bar{A}}(\bar{a}_s, \mu) - C_w(\bar{a}_s, \mu/m_t) \left( \bar{\mathcal{F}}_{ns}^A(\bar{a}_s, \mu) + \sum_{i=1}^{n_l} \bar{\mathcal{F}}_{s,i}^{\bar{A}}(\bar{a}_s, \mu) \right) + \mathcal{O}(1/m_t^2)$$

The renormalized low-energy effective Lagrangian [Chetyrkin, Kühn 93; LC, Czakon, Nigetiedt 21]

$$\begin{aligned}\delta \mathcal{L}_{\text{eff}}^R &= \left( \textcolor{blue}{Z_{ns}} \sum_{i=1}^{n_l} a_i \bar{\psi}_i^B \gamma^\mu \gamma_5 \psi_i^B + a_b \textcolor{green}{Z_s} [J_5^\mu]_B \right. \longrightarrow \textcolor{blue}{n_l\text{-flavor massless part}} \\ &\quad \left. + a_t C_w(a_s, \mu/m_t) (Z_{ns} + n_l Z_s) [J_5^\mu]_B \right) \textcolor{brown}{Z_\mu},\end{aligned}$$

with  $J_5^\mu = \sum_{i=1}^{n_l} \bar{\psi}_i \gamma^\mu \gamma_5 \psi_i$  and  $\mu^2 \frac{d\textcolor{blue}{Z_{ns}}}{d\mu^2} = 0$  while  $\mu^2 \frac{d\textcolor{green}{Z_s}}{d\mu^2} = \bar{\gamma}_s (\textcolor{blue}{Z_{ns}} + n_l \textcolor{green}{Z_s})$

# Renormalization of $\bar{\psi}_q \gamma^\mu \gamma_5 \psi_q$

What is  $[J_{5,q}^\mu]_R$  as in  $[J_5^\mu]_R = \sum_{i=1}^{n_l} [J_{5,i}^\mu]_R$ ?

$$\begin{aligned}[J_5^\mu]_R &= Z_J J_5^\mu = (Z_{ns} + n_l Z_s) \sum_{i=1}^{n_l} \bar{\psi}_i^B \gamma^\mu \gamma_5 \psi_i^B \\&\quad \Downarrow \\[J_{5,q}^\mu]_R &\neq \cancel{(Z_{ns} + n_l Z_s)} \bar{\psi}_q^B \gamma^\mu \gamma_5 \psi_q^B \\&= \left( Z_{ns} \bar{\psi}_q^B \gamma^\mu \gamma_5 \psi_q^B + Z_s \sum_{i=1}^{n_l} \bar{\psi}_i^B \gamma^\mu \gamma_5 \psi_i^B \right)\end{aligned}$$

The renormalized singlet contribution featuring EW  $a_b$ :

$$\begin{aligned}\mathbf{F}_{s,b}^A(a_s, m_t, \mu) &= \langle \text{o} | [J_{5,b}^\mu]_R | b\bar{b} \rangle|_{singlet} \\&= \color{blue}{Z_{ns}} Z_2 F_{s,b}^A(\hat{a}_s, \hat{m}_t) + \color{green}{Z_s} Z_2 \left( \color{blue}{F_{ns}^A}(\hat{a}_s, \hat{m}_t) + \sum_{i=1}^{n_l} F_{s,i}^A(\hat{a}_s, \hat{m}_t) \right)\end{aligned}$$

Note  $\mu^2 \frac{d\color{blue}{Z_{ns}}}{d\mu^2} = \text{o}$  while  $\mu^2 \frac{d\color{green}{Z_s}}{d\mu^2} = \color{red}{\tilde{\gamma}_s} (\color{blue}{Z_{ns}} + n_l \color{green}{Z_s})$ .

# Resuming the non-decoupling $m_t$ logarithms

RG equation of the Wilson coefficient  $C_w(\bar{a}_s, \mu/m_t)$  [Chetyrkin, Kühn 93; LC, Czakon, Niggetiedt 21]

$$\mu^2 \frac{d}{d\mu^2} C_w(\bar{a}_s, \mu/m_t) = \bar{\gamma}_s - n_l \bar{\gamma}_s C_w(\bar{a}_s, \mu/m_t),$$

$$\mu^2 \frac{d}{d\mu^2} [J_{5,q}^\mu]_R = \bar{\gamma}_s [J_5^\mu]_R \text{ with } J_5^\mu = \sum_{i=1}^{n_l} = \bar{\psi}_i \gamma^\mu \gamma_5 \psi_i.$$

The solution for  $C_t \equiv -1/n_l + C_w$ :

$$\begin{aligned} \mu^2 \frac{d}{d\mu^2} C_t(\bar{a}_s, \mu/m_t) &= n_l \bar{\gamma}_s C_t(\bar{a}_s, \mu/m_t), \\ C_t(\bar{a}_s(\mu), \mu/m_t) &= C_t(\bar{a}_s(m_t), 1) \exp \left( \int_{\bar{a}_s(m_t)}^{\bar{a}_s(\mu)} \frac{-n_l \bar{\gamma}_s(a_s)}{\beta(a_s)} \frac{da_s}{a_s} \right) \end{aligned}$$

in Larin's scheme.

# Alternative renormalization prescriptions

---

- **MS scheme:**  $Z_5^{ms} [J_5^\mu]_B$

- ▶ The ABJ (AWTI) is not respected
- ▶  $\mathbf{F}_{s,b}^A(a_s, m_t) - \mathbf{F}_{s,t}^A(a_s, m_t)$  is still anomalous

- **Chetyrkin scheme:**  $Z_{ns}^f Z_5^{ms} [J_5^\mu]_B$

- ▶ The ABJ (AWTI) is not respected
- ▶  $\mathbf{F}_{s,b}^A(a_s, m_t) - \mathbf{F}_{s,t}^A(a_s, m_t)$  is non-anomalous (correct)

- **Larin scheme:**  $Z_s^f Z_5^{ms} \partial_\mu [J_5^\mu]_B = a_s n_f T_F (Z_{F\bar{F}} [J_5^\mu]_B + Z_{FI} \partial_\mu [J_5^\mu]_B)$

- ▶ The ABJ (AWTI) is respected and  $\gamma_s \neq 0$
- ▶  $\mathbf{F}_{s,b}^A(a_s, m_t) - \mathbf{F}_{s,t}^A(a_s, m_t)$  is non-anomalous (correct)

- **Renormalization-group invariant (RGI) scheme:**  $Z_{ext}(a_s) \equiv \hat{P}\exp\left(\int_0^{a_s} \frac{-\gamma_S(a)}{\beta(a)} \frac{da}{a}\right)$

- ▶ The ABJ (AWTI) is respected and  $\gamma_s = 0$  (no more running!)
- ▶  $Z_{F\bar{F}}^{\text{RGI}} \neq Z_{\alpha_s}$
- ▶ No more explicit  $\ln(\mu^2/m_t^2)$  when expressed w.r.t  $\alpha_s(\mu = m_t)$  [LC, Czakon 22].

# Summary and Outlook

---

- We have described a very efficient way for computing the renormalization constants of axial-vector currents in QCD with a non-anticommuting  $\gamma_5$  in dimensional regularization.
- We have verified explicitly up to 4-loop order  $Z_{F\tilde{F}} = Z_{\alpha_s}$  (in the  $\overline{\text{MS}}$  scheme), from which follows  $\gamma_s = a_s n_f T_F \gamma_{FI}$  valid to  $\mathcal{O}(\alpha_s^4)$ .
- A proof of  $Z_{F\tilde{F}} = Z_{\alpha_s}$  in dimensionally regularized QCD to all orders is recently completed [Lüscher, Weisz 21].
- We have extended the result of  $Z_J$  of the flavor-singlet axial-vector current to  $\mathcal{O}(\alpha_s^4)$ , with its  $\overline{\text{MS}}$  part to  $\mathcal{O}(\alpha_s^5)$  by the virtue of ABJ equation
- Needed for resumming the non-decoupling heavy-quark-mass logarithms and in the calculation of polarized splitting functions at high orders...

# Treatment of the operator $F\tilde{F}$

The axial-anomaly (topological-charge density) operator  $F\tilde{F}$  with the Chern-Simons current  $K^\mu$

$$\begin{aligned} F\tilde{F} &= \partial_\mu K^\mu \\ &= \partial_\mu \left( -4 \epsilon^{\mu\nu\rho\sigma} \left( A_\nu^a \partial_\rho A_\sigma^a + g_s \frac{1}{3} f^{abc} A_\nu^a A_\rho^b A_\sigma^c \right) \right) \end{aligned}$$

by the virtue of total antisymmetry of  $\epsilon^{\mu\nu\rho\sigma}$  [Bardeen 74].

Unlike  $J_5^\mu$ , the current  $K^\mu$  is **not** gauge-invariant.

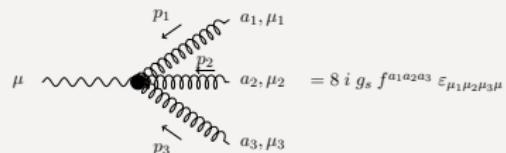

The Feynman Rules in use:

$$\begin{aligned} \Gamma_{rhs}^{\mu\mu_1\mu_2}(p_1, p_2) &\equiv \int d^4x d^4y e^{-ip_1 \cdot x - iq \cdot y} \\ &\quad \langle 0 | \hat{T} [K^\mu(y) A_a^{\mu_1}(x) A_a^{\mu_2}(0)] | 0 \rangle |_{amp} \end{aligned}$$

$$\mathcal{M}_{rhs} = \mathcal{P}_{\mu\mu_1\mu_2} \Gamma_{rhs}^{\mu\mu_1\mu_2}(p_1, -p_1).$$

$$= 4 \delta_{a_1 a_2} \epsilon_{\mu_1 \mu_2 \mu(p_2 - p_1)}$$

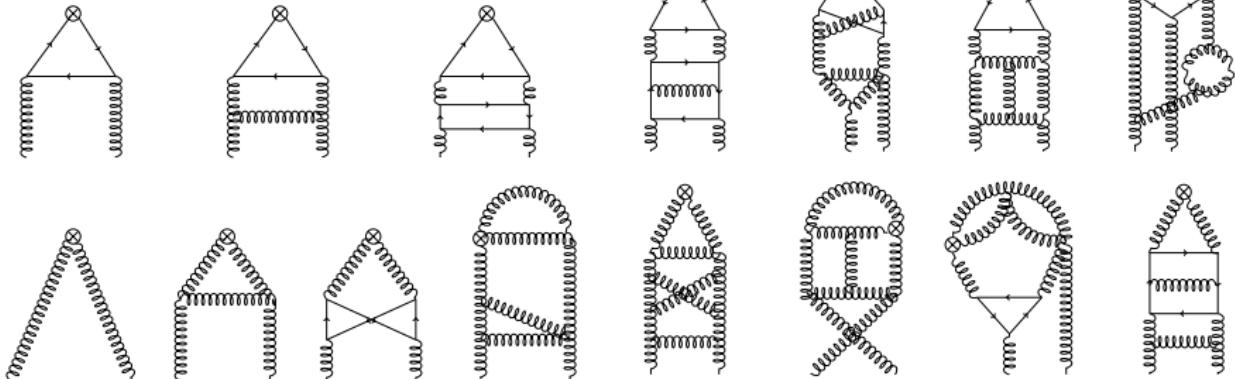

$$= 8 i g_s f^{a_1 a_2 a_3} \epsilon_{\mu_1 \mu_2 \mu_3 \mu}$$

# Feynman diagrams

## The Work Flow:

- ▶ Generating Feynman diagrams  
DiaGen/IdSolver [Czakon]
- ▶ Applying Feynman Rules,  
Dirac/Lorentz algebra, Color algebra
- ▶ IBP reduction of loop integrals [Tkachov 81;  
Chetyrkin,Tkachov 81]
- ▶ Inserting Master integrals

Loop order \ Generator	DiaGen		Qgraf	
	l.h.s.	r.h.s.	l.h.s.	r.h.s.
1	2	3	2	4
2	20	57	21	64
3	429	1361	447	1488
4	11302	37730	11714	40564

# IBP reduction and master integrals

---

Loop integrals in diagrams, reduced by IBP [Tkachov 81; Chetyrkin,Tkachov 81];

Analytic results of  $p$ -master integrals, up to 4 loop [Baikov, Chetyrkin 10; Lee, Smirnov,Smirnov 12].

- DiaGen/IdSolver [Czakon] + Forcer [Ruijl,Ueda,Vermaseren]
  - ▶ **Amplitude projection:** about  $3 + 6$  days @ 24 cores (Intel® Xeon® Silver 4116)
  - ▶ **Forcer (pre-solved IBP):** about  $12 + 24$  hours @ 8 cores (Intel® Xeon® E3-1275 V2)
- QGRAF [Nogueira] + FORM [Vermaseren] + Reduze 2 [Manteuffel, Studerus] + FIRE [Smirnov] combined with LiteRed [Lee]
  - ▶ **IBP (by Laporta):** about one month @ 32 cores (Intel® Xeon® Silver 4216)
  - ▶ a few hundred GB RAM

At 4-loop:  $\sim 10^5$  loop integrals in Feynman amplitudes reduced to **28** masters.

The analytical results were found to be identical between the two set-ups.

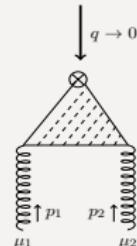

# The zero momentum insertion limit

Evaluating  $\mathcal{M}$  at  $q = 0$  with off-shell gluon momenta  $p_1^2 \neq 0$ :

$$\Gamma_{lhs}^{\mu\mu_1\mu_2}(p_1, -p_1) = -2F_1 \epsilon^{\mu\mu_1\mu_2 p_1},$$

$$\mathcal{P}_{\mu\mu_1\mu_2} = -\frac{1}{6p_1 \cdot p_1} \epsilon_{\mu\mu_1\mu_2\nu} p_1^\nu,$$

[Ahmed, LC, Czakon 21]

$$\frac{1}{(6-11D+6D^2-D^3)p_1 \cdot p_1} \epsilon_{\mu\mu_1\mu_2 p_1} \xrightarrow{-1} \frac{-1}{6p_1 \cdot p_1} \epsilon_{\mu\mu_1\mu_2 p_1} \text{ albeit with indices in } D \quad [\text{LC 19}]$$

- possible IR divergences nullified owing to the *IR-rearrangement* [Vladimirov 79]
- 4-loop massless *propagator-type* master integrals available [Smirnov, Tentyukov 10, Baikov, Chetyrkin 10; Lee, Smirnov, Smirnov 11]
- gauge-dependent  $\mathcal{M} \implies$  UV renormalization of *gauge parameter*  $\xi$  !

## From [Baikov, Chetyrkin, Kühn, Rittinger, arXiv:1201.5804]

The decay rate of the  $Z$ -boson into hadrons in massless QCD up to  $\mathcal{O}(\alpha_s^4)$ :

$$\begin{aligned}\Gamma_Z = \Gamma_0 R^{\text{nc}} &= \frac{G_F M_Z^3}{24\pi\sqrt{2}} R^{\text{nc}} \\ R^{\text{nc}} &= 20.1945 + 20.1945 \alpha_s \\ &\quad + (28.4587 - 13.0575 + o) \alpha_s^2 \\ &\quad + (-257.825 - 52.8736 - 2.12068) \alpha_s^3 \\ &\quad + (-1615.17 + 262.656 - 25.5814) \alpha_s^4,\end{aligned}$$

The three terms in the brackets display separately non-singlet, axial singlet and vector singlet contributions.
