

CEPC Vertex Reconstruction Performance

Yongfeng Zhu

Vertex reconstruction is important for flavor physics and jet flavor tagging.

Sample : $Z \rightarrow c\bar{c}$, full simulation with CEPC baseline detector

vertex reconstruction software : LCFIPLUS

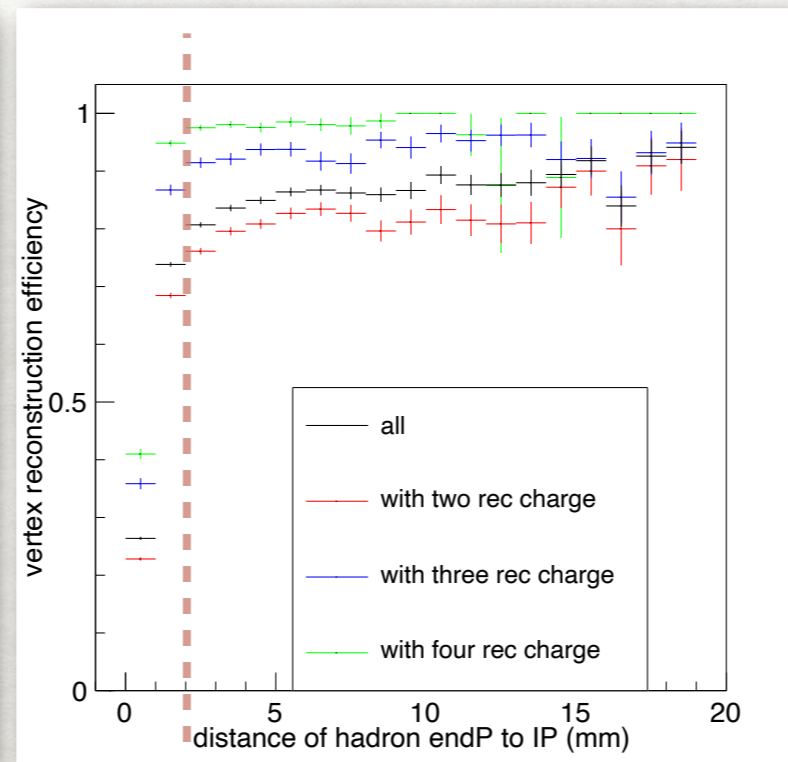

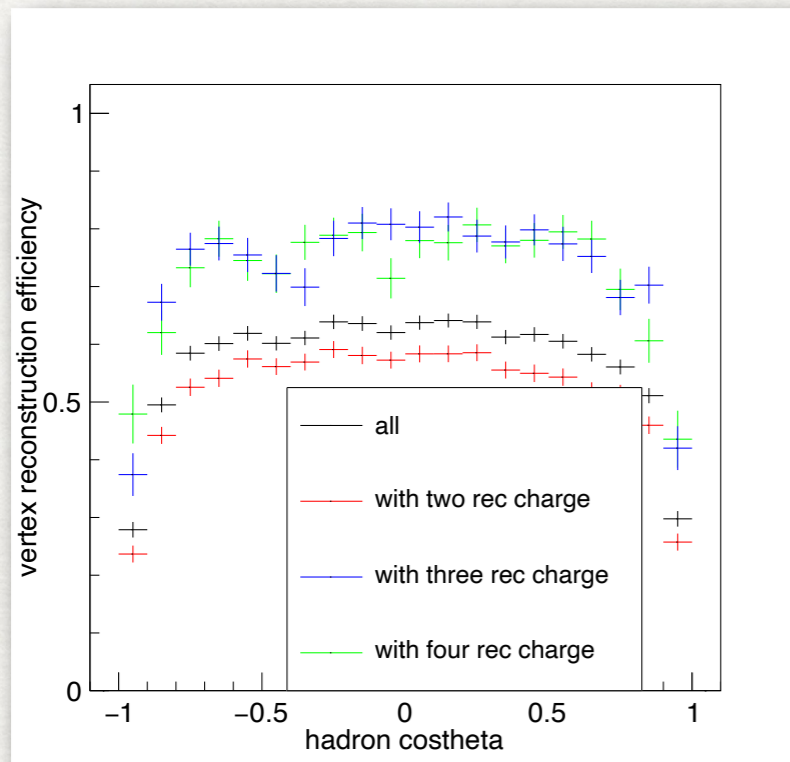

The correlation between secondary vertex reconstruction performance and

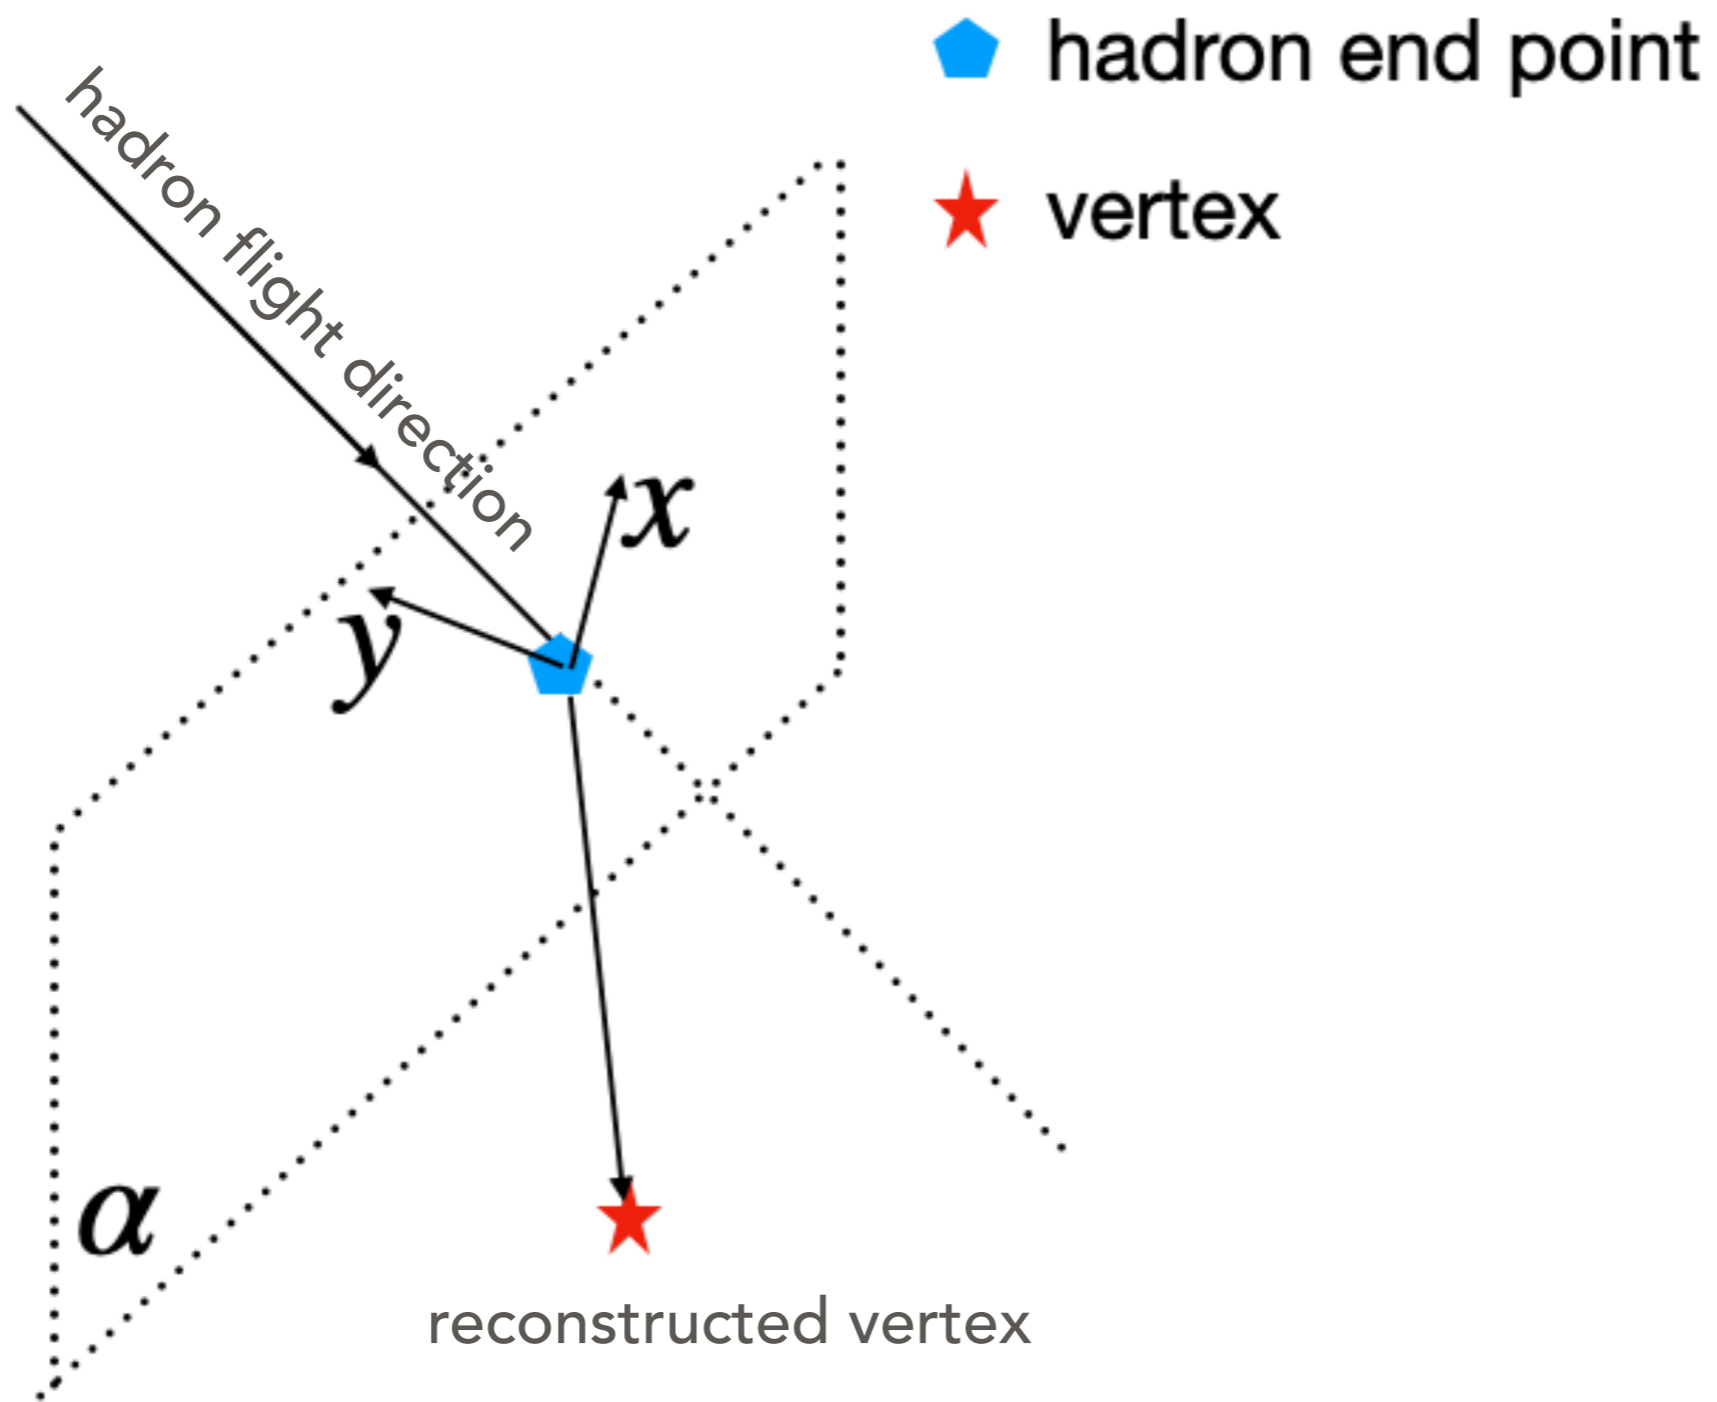

the direction of hadron flight

the energy of hadron

the distance of hadron endpoint to IP

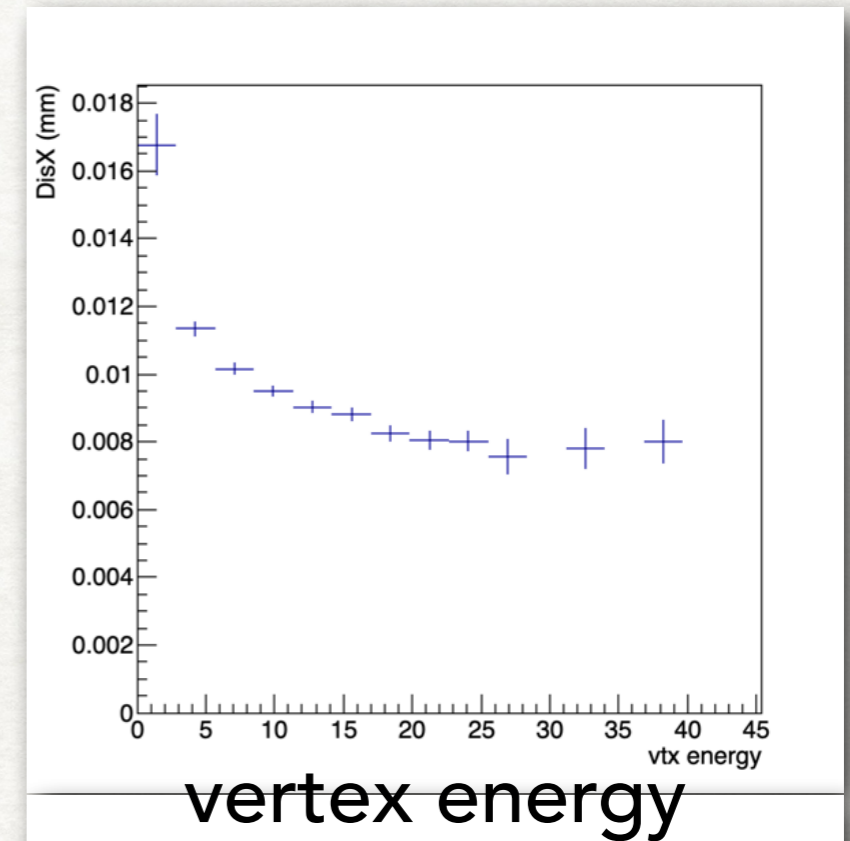

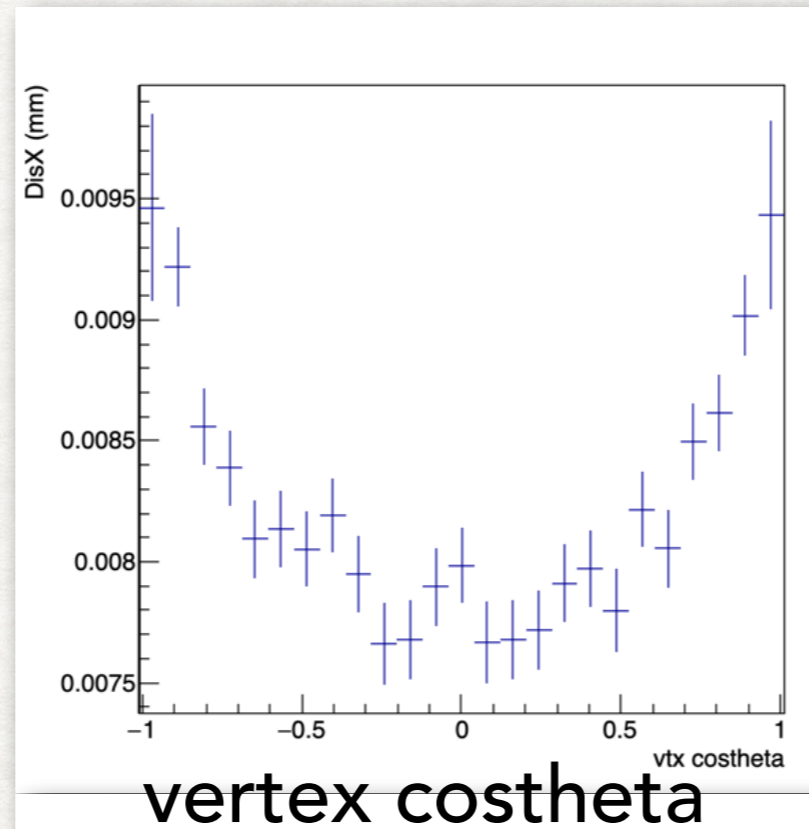

red : two charged particles
blue : three charged particles
green : four charged particles
black : all conditions

reconstructed vertex position precision

perpendicular to hadron
flight direction

~ 0.008 mm

parallel to hadron
flight direction

~ 0.18 mm

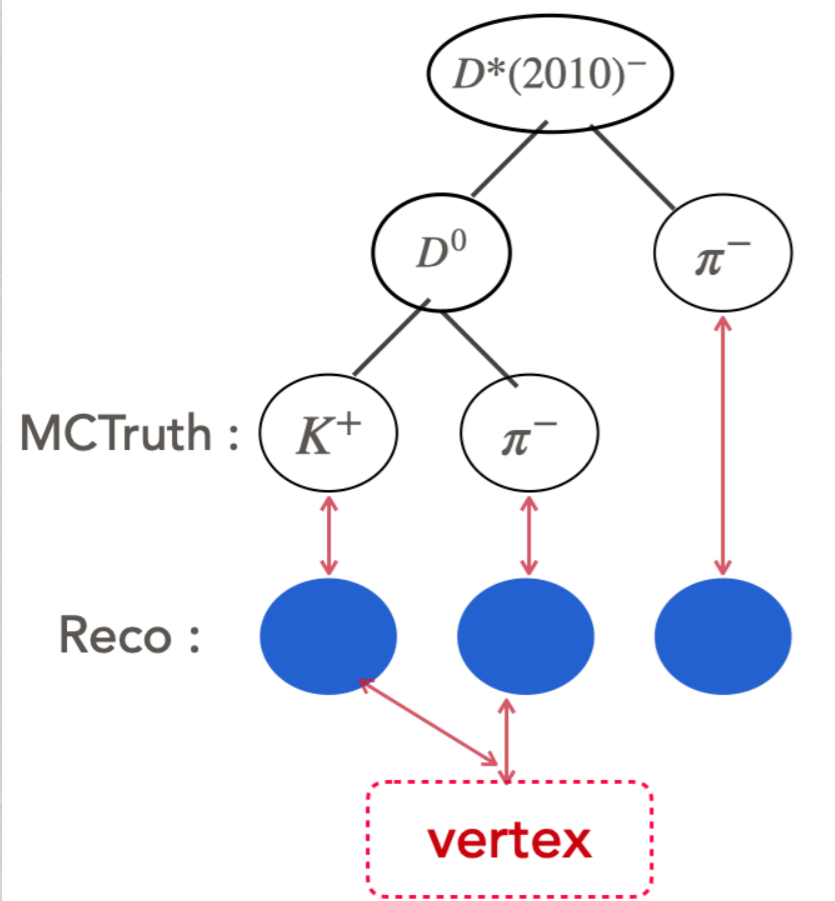

The results need to be verified in a further step.

Conclusion :

- The secondary vertex reconstruction performance are relies to the hadron flight direction, the distance of hadron endpoint to IP, the energy of hadron.
- If the distance of hadron endpoint to IP is larger than 2mm, the overall reconstruction efficiency can be larger than 80%.
- Next, we will compare these conditions with $Z \rightarrow b\bar{b}$ samples and explore more vertex reconstruction methods (cluster, Topological vertex finding).

Many thanks!
