HAWC γ -ray Observatory

29th International Workshop on Weak Interactions and Neutrinos

Ramiro Torres-Escobedo

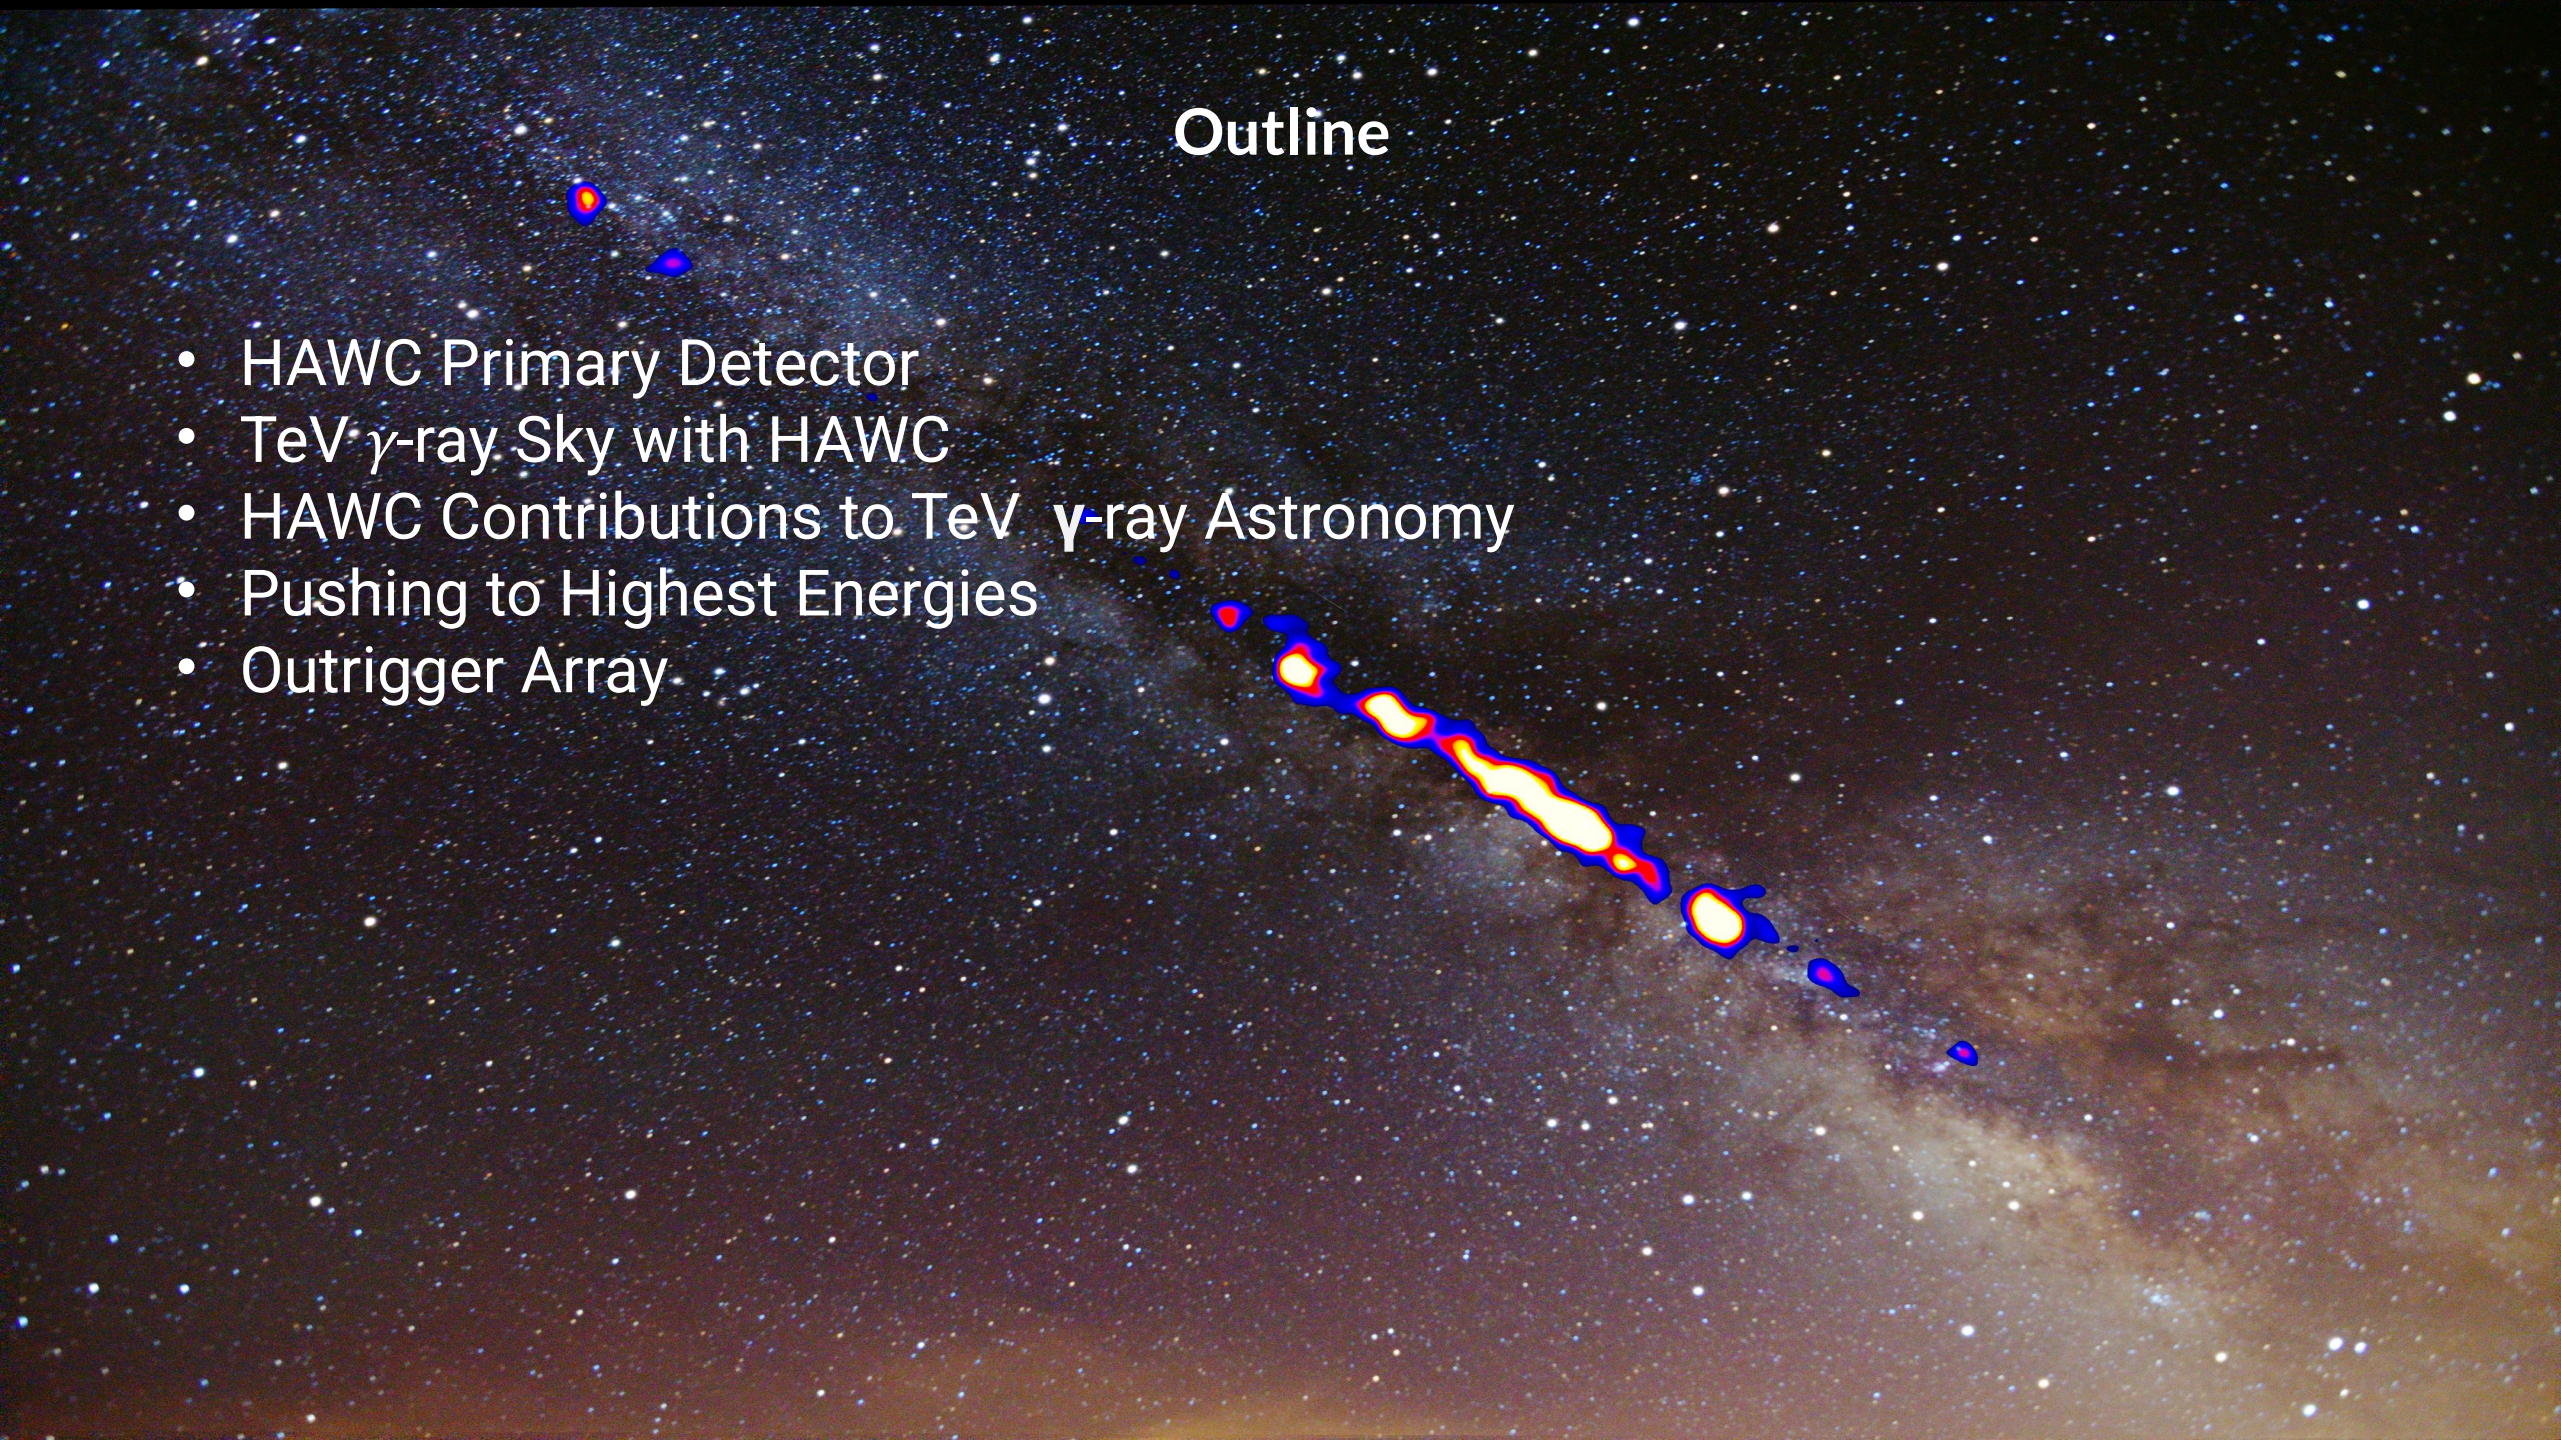

(on behalf of the HAWC collaboration)

July 4, 2023

Outline

- HAWC Primary Detector
- TeV γ -ray Sky with HAWC
- HAWC Contributions to TeV γ -ray Astronomy
- Pushing to Highest Energies
- Outrigger Array

● HAWC Collaboration

• HAWC γ -ray Observatory

- 300 closely spaced isolated water Cherenkov detectors (WCDs)
- Launched into full operations since March 2015
- >95% duty cycle
- Instantaneous FOV $\sim 2\text{sr}$ and can observe 2/3 of sky everyday
- ~ 5 billion triggers to date (~ 7 Pb of data)
- Optimized for energies 100 GeV - 100 TeV

Mapping the Northern Sky in High-Energy Gamma Rays

HAWC Observatory

HAWC operates day and night, providing a large field of view for the observation of the highest energy gamma rays.

Pico de Orizaba (5,626 m)

HAWC is located at 4,100 m above sea level, covering an area of 20,000 m².

Water Cherenkov tank

HAWC comprises an array of 300 tanks that record the particles created in gamma-ray and cosmic-ray showers.

Gamma rays vs cosmic rays

HAWC selects gamma rays from among a much more abundant background of cosmic rays.

gamma-ray shower

"hot" spots concentrate around the core

cosmic-ray shower

"hot" spots are more dispersed

● HAWC γ -ray TeV Sky (2090 Days)

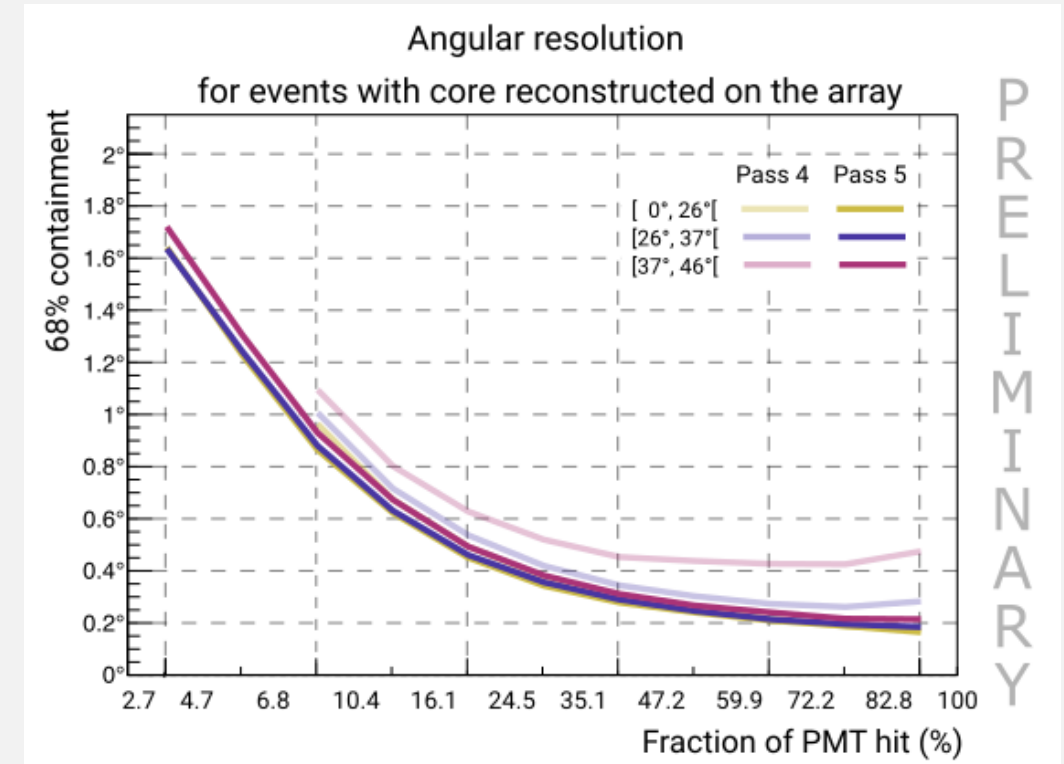

● HAWC γ -ray TeV Sky Survey (2090 Days)

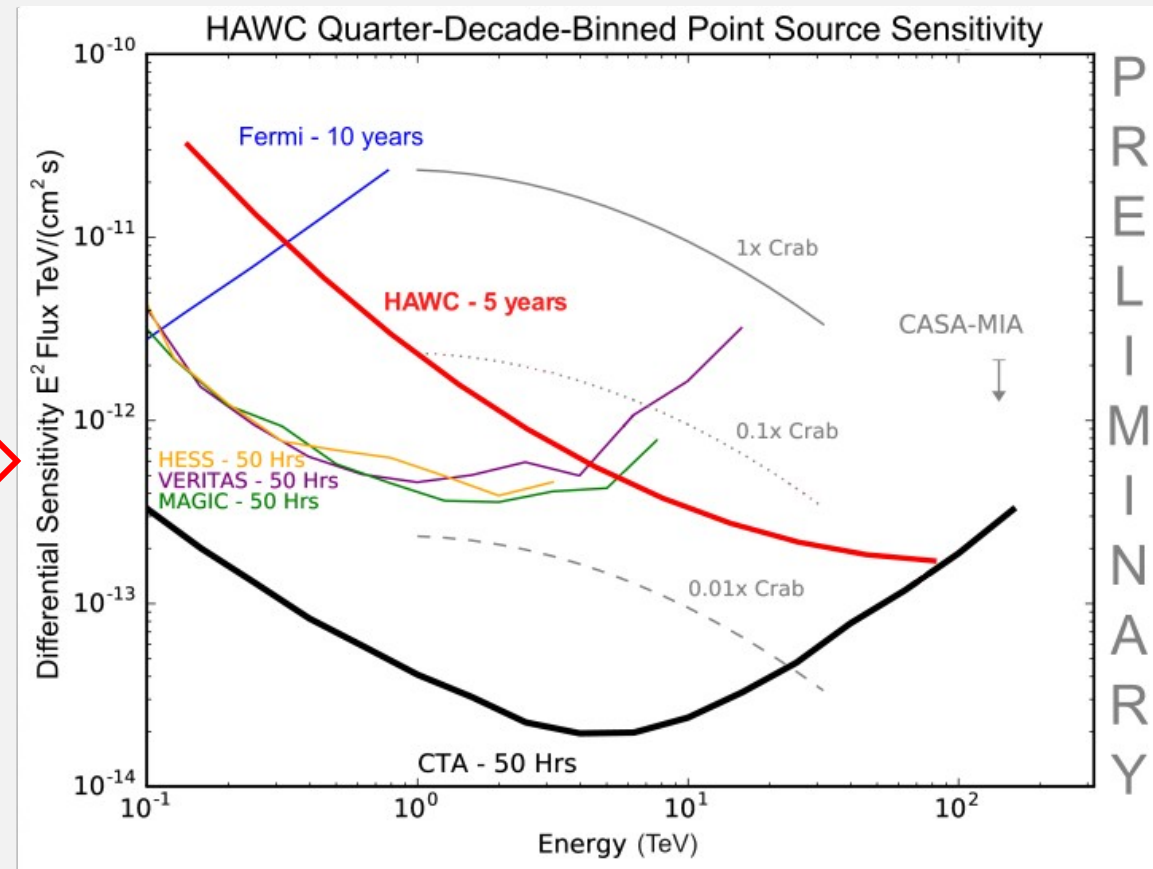

● Pass 5 – Improved Reconstruction:

- Improved background rejection for large events
- Improved angular resolution - does not degrade for high zenith angles
- Wider FOV increases from 45° to 60°

Pass 5 – Improved Reconstruction:

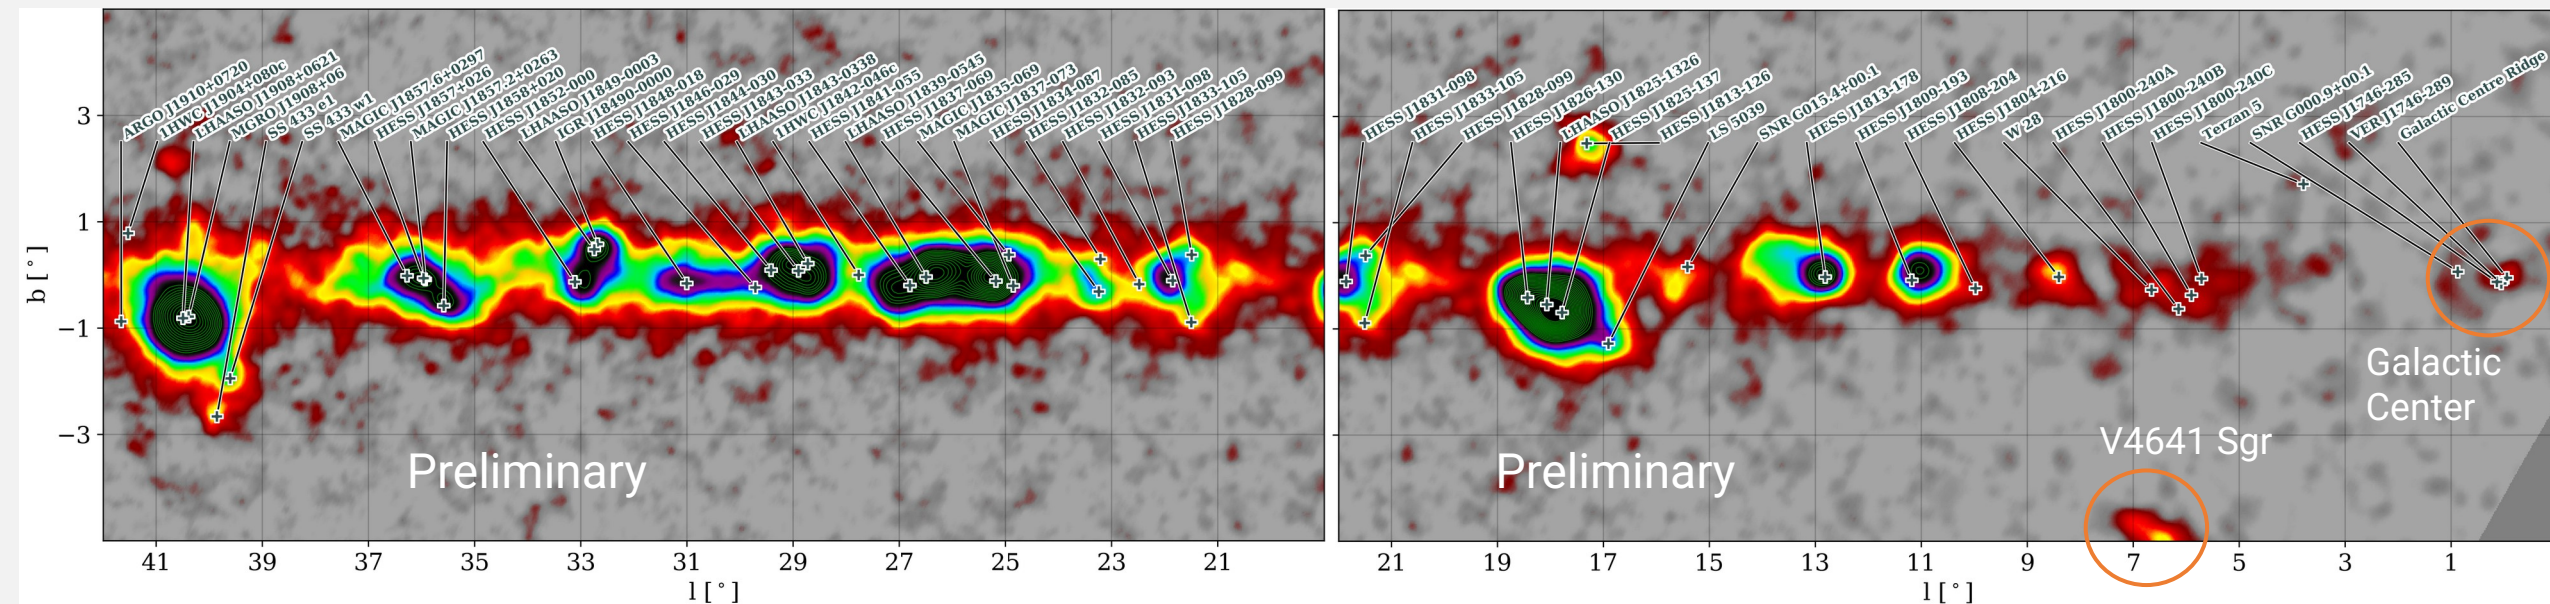

Comparison Pass 4 (1523 days) to Pass 5 (2090 days)

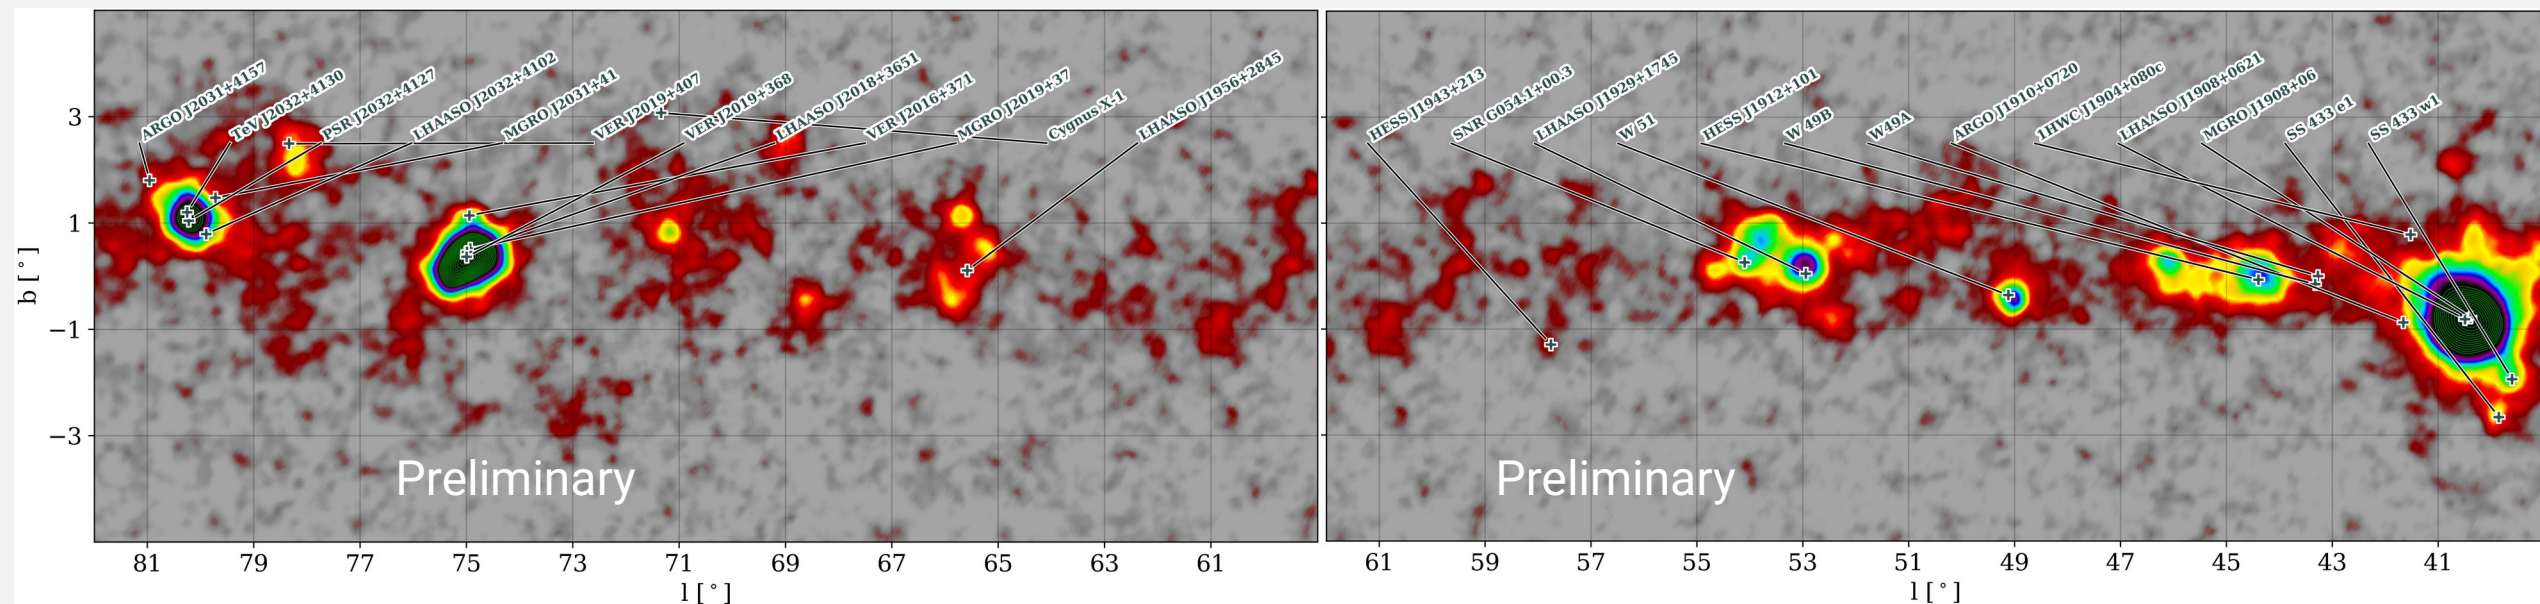

A. Albert et al 2020 *ApJ* **905** 76

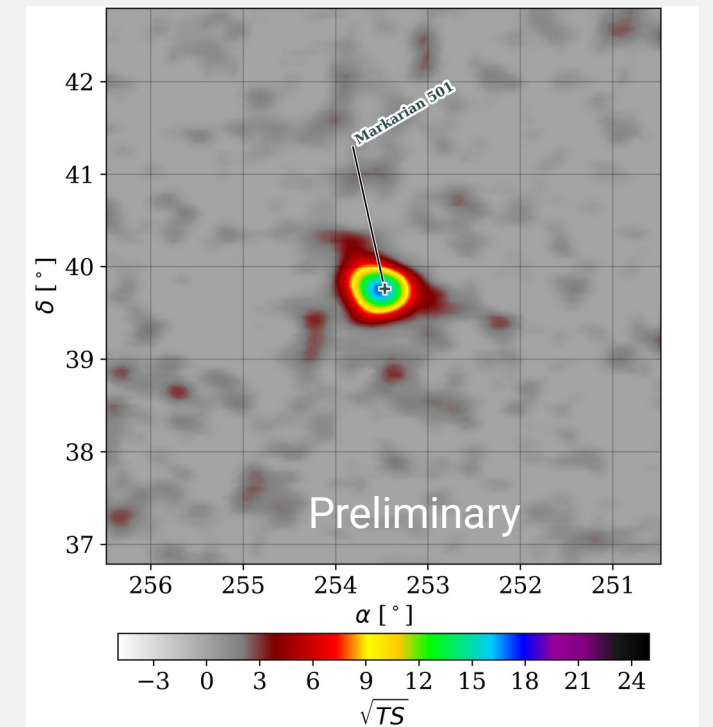

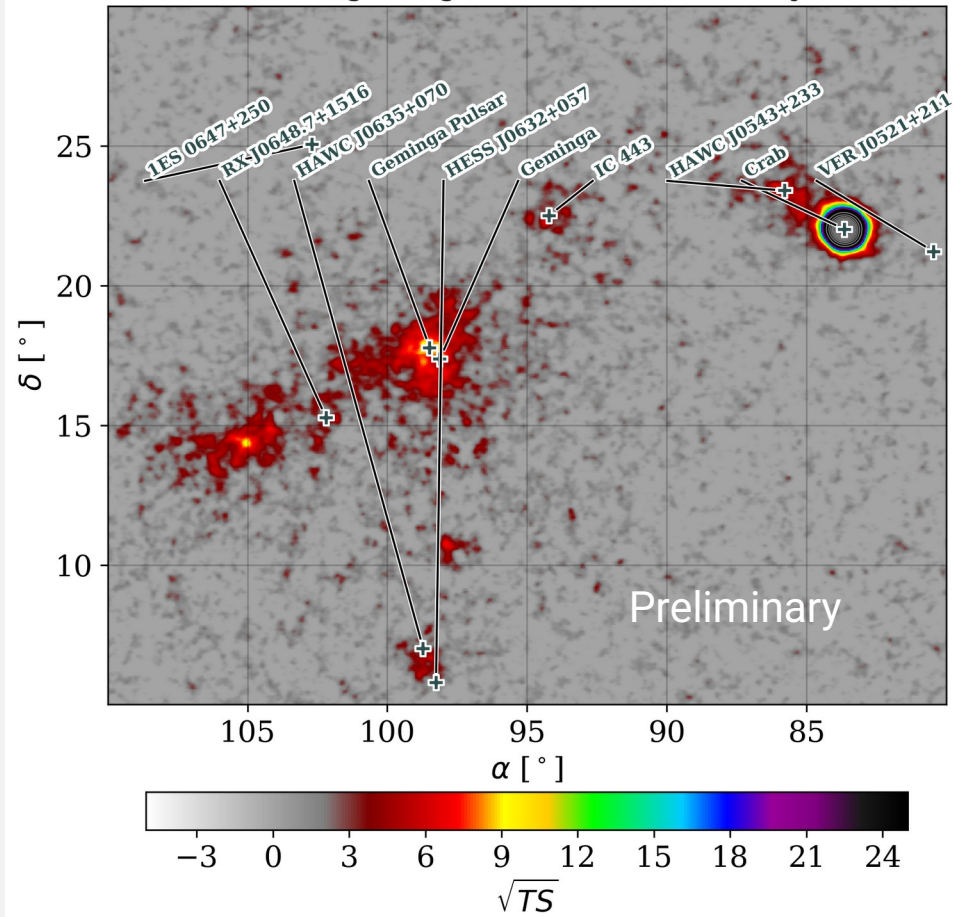

HAWC's TeV Sky—Galactic Plane (2090 days)

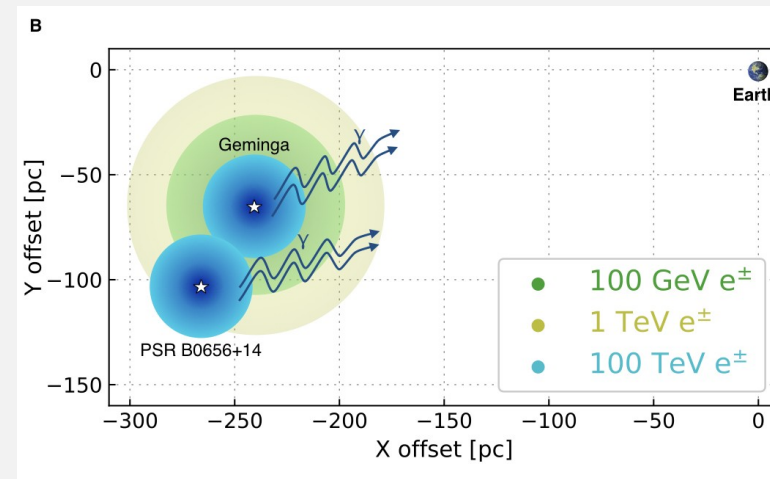

HAWC's TeV Sky—Galactic Plane (2090 days)

HAWC's TeV Sky – Off Galactic Plane (2090 days)

Science 2017 Vol 358, Issue 6365 pp. 911-914
[DOI: 10.1126/science.aan4880](https://doi.org/10.1126/science.aan4880)

SS433 Microquasar

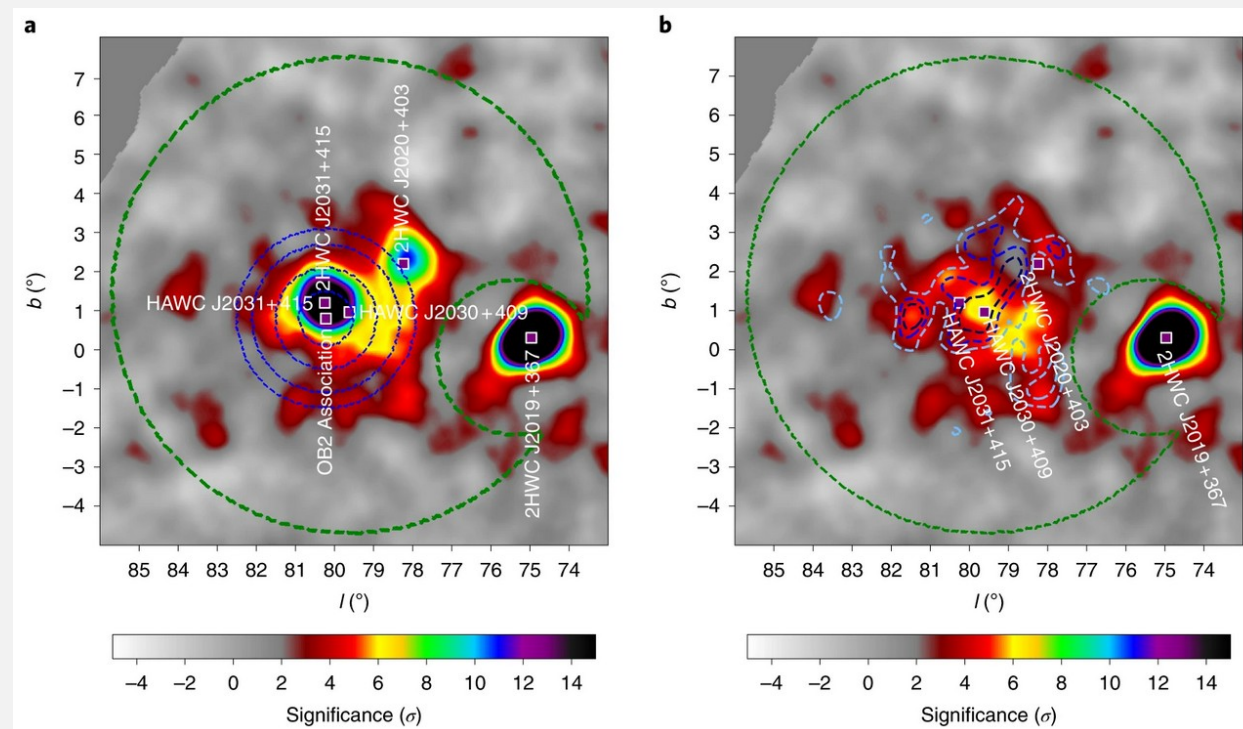

- HAWC detects TeV emission from microquasar SS433
- Binary system (Supergiant star) and compact object (black hole or neutron star)
- First evidence of TeV γ -ray emission coming from the lobes
- TeV emission can provide information about the nature of SS433

[Nature](https://doi.org/10.1038/s41586-018-0565-5) volume 562, pages 82–85 (2018)
<https://doi.org/10.1038/s41586-018-0565-5>

● Cocoon Region

- First observations of γ -rays emission at energies 1–100 TeV
- These γ -rays are likely emitted from freshly accelerated cosmic-rays with 10 TeV–1 PeV
- Cygnus cocoon bubble coinciding with star formation region Cyg OB2

Nature, volume 5, pages 465–471 (2021)
<https://doi.org/10.1038/s41550-021-01318-y>

● HAWC's Sky > 56 TeV (2400 days)

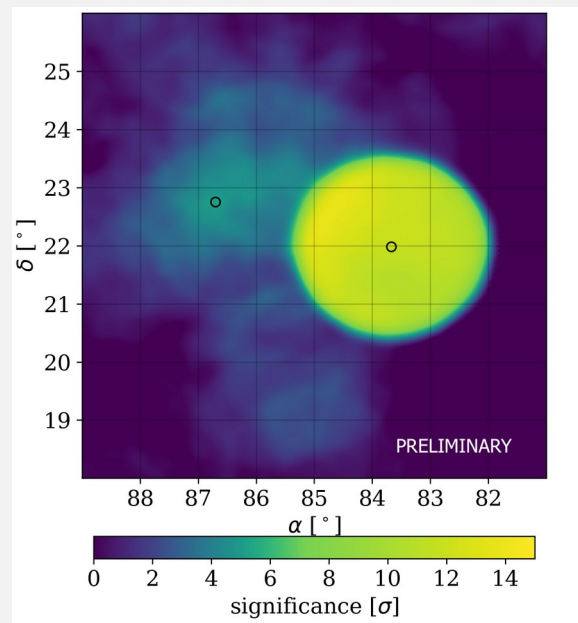

- Pass 5: 25 sources > 56 TeV
- Compared to 9 in Pass 4 (A. U. Abeysekara *et al.* Phys. Rev. Lett. 124, 021102)
- Most high energy sources appear to be extended

● HAWC's Sky > 56 TeV Off Plane (2400 days)

Crab

Crab "on fire" - emission from TeV J0543+234

Geminga

Boomerang

HAWC's Sky > 100 TeV (2400 days)

- Pass 5: 18 sources > 100 TeV (compared to 3 in Pass 4)
- Most high energy sources appear to be extended
- Crab appears point-like

Ext 0.5 Deg

● HAWC's Sky > 177 TeV (2400 days)

- Pass 5: 4 sources > 177 TeV (compared to 0 in Pass 4)
- Possible detection for PeVatrons
- Most high energy sources appear to be extended

● HAWC Outrigger Array

- Outrigger array upgrade fully operational since 2018
- Sparsely spaced OR array of 345 smaller WCDs
- Expected to increase sensitivity by 4 times
- Increase detection area up 100,000 m²
- Essential for detection of TeV halos & PeVatrons
