Standard model

Standard Model of Elementary Particles

Very successful describing low energy scale physics

Observation requiring new physics

- Neutrino masses
- Baryon asymmetry of our universe
- Inflation
- Dark matter
- Others(muon $g-2$? W mass?)

today's talk

Inflation

Rapid expansion of the universe in the early time

- Flatness problem
- Horizon problem
- Seeding the primordial anisotropies in CMB

Inflation

Stretching quantum fluctuations to large scale

gravity

$$\frac{\delta T}{T} \sim 10^{-5}$$

Such small fluctuations finally develops the large structure of our universe

Slow-roll inflation

Assume a scalar field, with equation of motion

$$\ddot{\phi} + 3H\dot{\phi} + \frac{\partial V}{\partial \phi} = 0$$

$$H^2 = \frac{1}{3} \left(\frac{1}{2} \dot{\phi}^2 + V(\phi) \right)$$

Slow roll condition $\epsilon_v, |\eta_v| \ll 1$

$$\epsilon_v(\phi) \equiv \frac{M_{\text{pl}}^2}{2} \left(\frac{V_{,\phi}}{V} \right)^2 \quad \eta_v(\phi) \equiv M_{\text{pl}}^2 \frac{V_{,\phi\phi}}{V}$$

$$H^2 \approx \frac{1}{3} V(\phi) \approx \text{const.} \quad \longrightarrow \quad a(t) \sim e^{Ht}$$

$$\Delta_s^2(k) \equiv \frac{k^3}{2\pi^2} \langle \delta\phi(k) \delta\phi(k') \rangle$$

$$n_s - 1 \equiv \frac{d \ln \Delta_s^2}{d \ln k} = 2\eta_v - 6\epsilon_v$$

- Perturbation close to scale invariant

$$n_s \simeq 0.965$$

- Primordial gravitational wave(not observed yet)

Neutrino masses

Neutrino oscillation requiring massive neutrinos

Solar Neutrino oscillations

$$\theta_{12}$$

Atmospheric Neutrino Oscillations

$$\theta_{23}$$

Reactor Neutrino Oscillations

$$\theta_{13}$$

$$\Delta m_{21}^2 \simeq 7.42 \times 10^{-5} \text{ eV}^2$$

$$|\Delta m_{13}^2| \approx |\Delta m_{23}^2| \simeq 2.5 \times 10^{-3} \text{ eV}^2$$

At least a neutrino mass larger or similar to 0.05 eV

Neutrino masses vs other fermion masses

A large hierarchy comparing with other fermion masses

Origin of neutrino masses

Three types of seesaw model(tree level)

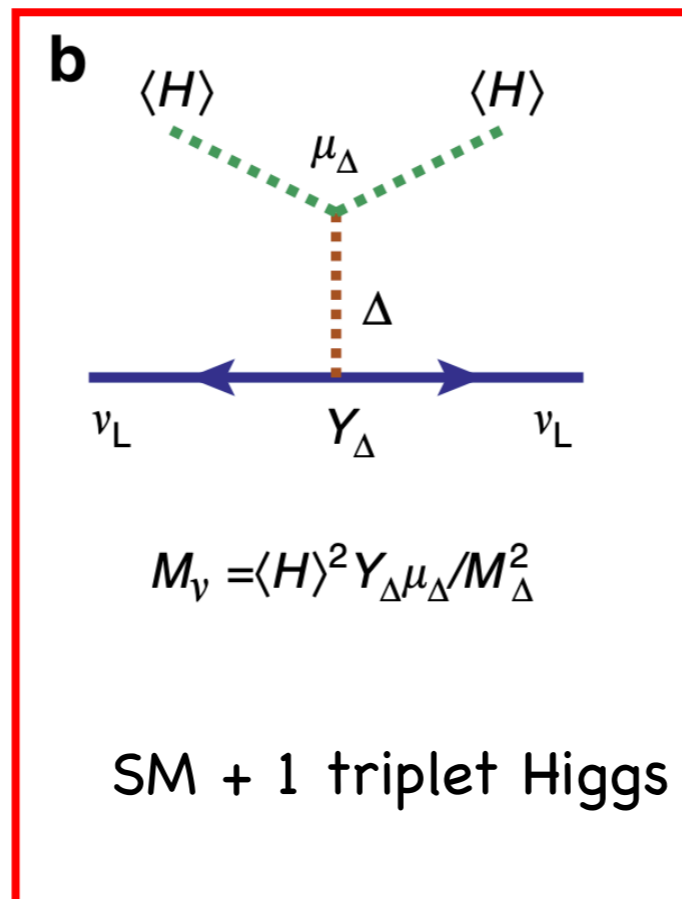

Tommy Ohlsson, Shun Zhou, Nature Commun. 5 (2014) 5153

$$M_\nu = -\langle H \rangle^2 Y_\nu M_R^{-1} Y_\nu^T$$

SM + 3 singlets fermions

Minkowski, Gell-Mann,
Glashow, Yanagida

$$M_\nu = \langle H \rangle^2 Y_\Delta \mu_\Delta / M_\Delta^2$$

SM + 1 triplet Higgs

Magg, Wetterich

$$M_\nu = -\langle H \rangle^2 Y_\Sigma M_\Sigma^{-1} Y_\Sigma^T$$

SM + 3 triplet fermions

Foot, Lew, He, Joshi

scalar

Origin of neutrino masses: type I seesaw

加入三个单态中性右手中微子 $N(1, 1, 0)$

$$\mathcal{L} = \mathcal{L}_{SM} + y_\nu \tilde{H} \bar{L} N - M_R \bar{N}^c N$$

$$M = \begin{pmatrix} 0 & m_D \\ m_D^T & M_R \end{pmatrix}$$

$$m_\nu \sim \frac{m_D^2}{M_R} = \frac{1}{2} \frac{y_\nu^2 \langle H \rangle^2}{M_R}$$

$$M_\nu = -\langle H \rangle^2 Y_\nu M_R^{-1} Y_\nu^T$$

中微子质量被压低!

Origin of neutrino masses: type II seesaw

引入一个希格斯三重态跟中微子直接耦合

$$H(2, 1/2), \Delta(3, 1), L(2, -1/2)$$

$$H = \begin{pmatrix} h^+ \\ h \end{pmatrix}, \quad \Delta = \begin{pmatrix} \Delta^+/\sqrt{2} & \Delta^{++} \\ \Delta^0 & -\Delta^+/\sqrt{2} \end{pmatrix}$$

$$\mathcal{L}_{Yukawa} = \mathcal{L}_{Yukawa}^{\text{SM}} - \frac{1}{2} y_{ij} \bar{L}_i^c \Delta L_j + h.c.$$

$$\frac{1}{2} y_{ij} \Delta^0 \bar{\nu}^c \nu + h.c.$$

- Giving neutrino mass matrix with vev of Delta
- at the same time Delta get a lepton number -2

Origin of neutrino masses: type II seesaw

$$H(2, 1/2), \Delta(3, 1), L(2, -1/2)$$

$$V(H, \Delta) = -m_H^2 H^\dagger H + \lambda_H (H^\dagger H)^2 + m_\Delta^2 \text{Tr}(\Delta^\dagger \Delta) + \lambda_1 (H^\dagger H) \text{Tr}(\Delta^\dagger \Delta) + \lambda_2 (\text{Tr}(\Delta^\dagger \Delta))^2 + \lambda_3 \text{Tr}(\Delta^\dagger \Delta)^2 + \lambda_4 H^\dagger \Delta \Delta^\dagger H + [\mu(H^T i\sigma^2 \Delta^\dagger H) + h.c.] + \dots$$

U(1)_L breaking term

$$\langle \Delta^0 \rangle \simeq \frac{\mu v_{\text{EW}}^2}{2m_\Delta^2}$$

电弱精确测量限制

$$\mathcal{O}(1) \text{ GeV} > |\langle \Delta^0 \rangle| \gtrsim 0.05 \text{ eV}$$

中微子质量要求

$$M_\nu = \langle H \rangle^2 Y_\Delta \mu_\Delta / M_\Delta^2$$

Neutrino masses connecting another
important problem:

Baryon asymmetry of our universe

Baryon asymmetry of our universe

BBN

$$\eta = \frac{n_b - n_{\bar{b}}}{s} \sim 10^{-10}$$

Parameter	Plik best fit	Plik [1]	CamSpec [2]	([2] - [1])/σ ₁	Combined
$\Omega_b h^2$	0.022383	0.02237 ± 0.00015	0.02229 ± 0.00015	-0.5	0.02233 ± 0.0001
$\Omega_c h^2$	0.12011	0.1200 ± 0.0012	0.1197 ± 0.0012	-0.3	0.1198 ± 0.0012

Without baryon asymmetry: too less matter

$$\frac{n_b}{s} = \frac{n_{\bar{b}}}{s} \sim 10^{-20}$$

How to generate baryon asymmetry?

Assuming no baryon asymmetry in the beginning
(if any, diluted by inflation)

Sakharov conditions

1. B number violation
2. C and CP violation
3. Out of thermal equilibrium

SM has (1) (2) but not enough CP violation, (3) does not

Three popular ways to generate baryon asymmetry

- **Electroweak baryogenesis** Rubakov and Shaposhnikov, 1996'
D. E. Morrissey and M. J. Ramsey-Musolf, 2012'
First order phase transition (adding scalars) + additional \cancel{CP}
- **Baryogenesis via thermal leptogenesis** Fukugita and Yanagida, 1986'
Connection to neutrino masses
$$n_B = \frac{28}{79} (\mathcal{B} - \mathcal{L})_i$$
- **Baryogenesis from Affleck-Dine mechanism** Affleck and Dine, 1985'
A well-known mechanism for SUSY society

Baryogenesis via leptogenesis from Type I seesaw

Baryogenesis Without Grand Unification (4000 citations),
Fukugita and Yanagida, 1986'

$$\mathcal{L}_I = \mathcal{L}_{SM} + i\overline{N_{R_i}}\not{\partial}N_{R_i} - \left(\frac{1}{2}M_i\overline{N_{R_i}^c}N_{R_i} + \epsilon_{ab}Y_{\alpha i}\overline{N_{R_i}}\ell_{\alpha}^a H^b + h.c. \right)$$

$$\epsilon_{i\alpha} = \frac{\gamma(N_i \rightarrow l_\alpha H) - \gamma(N_i \rightarrow \bar{l}_\alpha H^*)}{\sum_\alpha \gamma(N_i \rightarrow l_\alpha H) + \gamma(N_i \rightarrow \bar{l}_\alpha H^*)}$$

$$n_B = \frac{28}{79}(\mathcal{B} - \mathcal{L})_i$$

Generally N mass $> 10^7$ GeV, difficult to probe

How about type II seesaw leptogenesis?

Leptogenesis from type II seesaw?

Type II seesaw Neutrino Masses and Leptogenesis with Heavy Higgs Triplets (**500+ citations**)
 E. Ma, U. Sarkar, Phys.Rev.Lett. 80 (1998) 5716-5719

$$M \sim 10^{13} \text{ GeV}$$

$$\delta_i = 2 \left[B(\psi_i^- \rightarrow ll) - B(\psi_i^+ \rightarrow l^c l^c) \right]$$

$$\delta_i = \frac{\text{Im} \left[\mu_1 \mu_2^* \sum_{k,l} y_{1kl} y_{2kl}^* \right]}{8\pi^2 (M_1^2 - M_2^2)} \left[\frac{M_i}{\Gamma_i} \right]$$

At least two triplet Higgs are needed to generate the baryon asymmetry

But one triplet Higgs is enough to give neutrino masses

Leptogenesis from type II seesaw?

Physics Reports

Volume 466, Issues 4–5, September 2008, Pages 105-177

Leptogenesis (1,000+ citations)

Sacha Davidson ^a , Enrico Nardi ^{b, c} , Yosef Nir ^{d, 1}

To calculate ϵ_T , one should use the Lagrangian terms given in eqn (2.15). While a single triplet is enough to produce three light massive neutrinos, there is a problem in leptogenesis if indeed this is the only source of neutrinos masses: The asymmetry is generated only at higher loops and in unacceptably small.

It is still possible to produce the required lepton asymmetry from a single triplet scalar decays if there are additional sources for the neutrino masses, such as type I, type III, or type II contributions from

One triplet Higgs can not generate leptogenesis, but it is enough to give neutrino masses!

Leptogenesis from type II seesaw

PHYSICAL REVIEW LETTERS **128**, 141801 (2022)

Affleck-Dine Leptogenesis from Higgs Inflation

Neil D. Barrie^{1,*}, Chengcheng Han^{2,†} and Hitoshi Murayama^{3,4,5,‡}

 (Received 19 June 2021; revised 17 January 2022; accepted 9 March 2022; published 6 April 2022)

We find that the triplet Higgs of the type-II seesaw mechanism can simultaneously generate the neutrino masses and observed baryon asymmetry while playing a role in inflation. We survey the allowed parameter space and determine that this is possible for triplet masses as low as a TeV with a preference for a small

Type II Seesaw leptogenesis

Neil D. Barrie,^a Chengcheng Han^b and Hitoshi Murayama^{c,d,e,1}

Affleck-Dine mechanism

Assuming ϕ is a complex scalar with B charge

$$V(\phi) = \frac{1}{2}m^2|\phi|^2 + [c_{n,m}\phi^n(\phi^*)^m + h.c.] \quad m \neq n$$

(B violation)

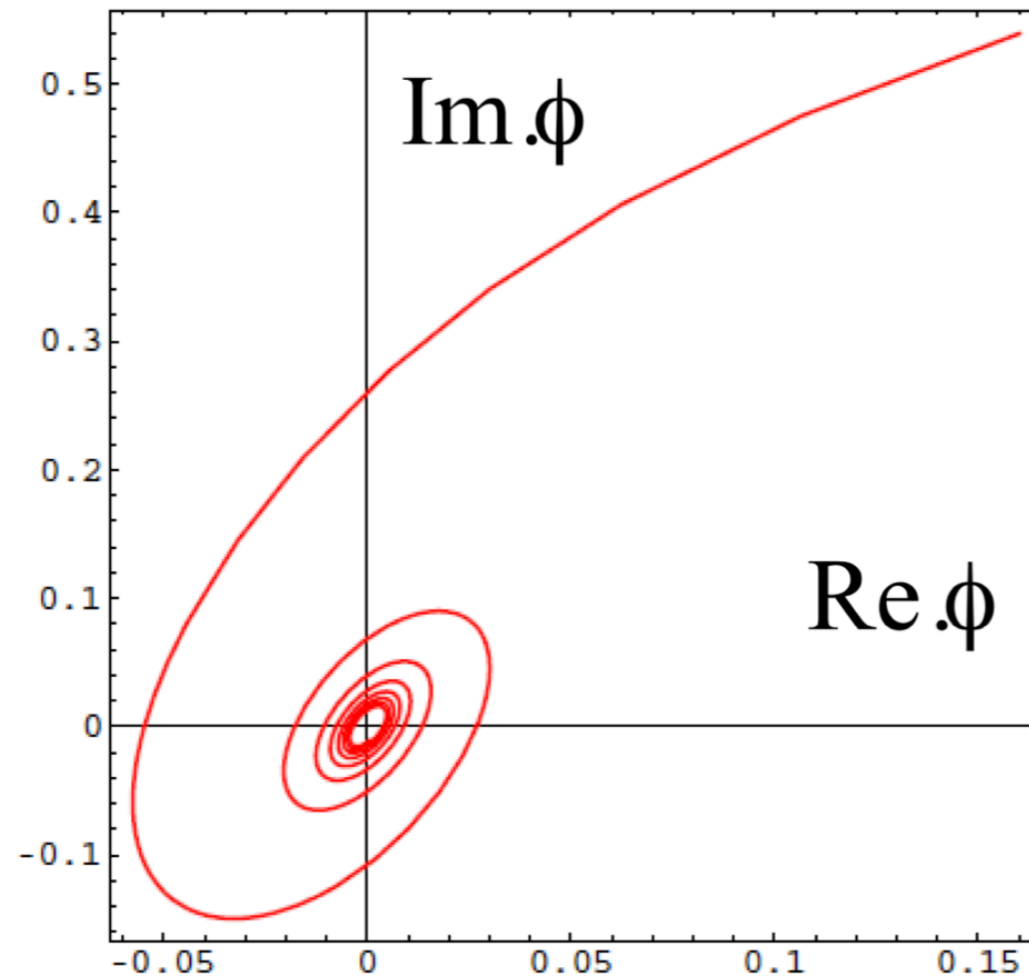

$$j_B^\mu = i(\phi^* \partial^\mu \phi - \phi \partial^\mu \phi^*)$$

ϕ is spatially constant

$$n_B = i(\phi^* \dot{\phi} - \phi \dot{\phi}^*) = \rho_\phi^2 \dot{\theta} \quad \phi = \frac{1}{\sqrt{2}} \rho_\phi e^{i\theta}$$

A motion of θ will generate baryon number

Affleck-Dine mechanism

- Scalar particle taking B/L charge (many candidates in SUSY)
- Small B/L violation term in the potential
- Scalar particle with initial displaced vacuum

Affleck-Dine mechanism for type II seesaw

Three conditions for Affleck-Dine mechanism

	Type II seesaw
● Scalar particle taking B/L charge	✓
● Small B/L violation term in the potential	✓
● Scalar particle with initial displaced vacuum	?

Affleck-Dine mechanism for type II seesaw

Three conditions for Affleck-Dine mechanism

	Type II seesaw
● Scalar particle taking B/L charge	✓
● Small B/L violation term in the potential	✓
● Scalar particle with initial displaced vacuum	✓

If the scalar plays the role of inflation

SM+Type II seesaw

To be consistent with inflation, we need add non-minimal couplings

$$\frac{\mathcal{L}}{\sqrt{-g}} = -\frac{1}{2}M_P^2 R - \boxed{f(H, \Delta)R} - g^{\mu\nu} (D_\mu H)^\dagger (D_\nu H) \\ - g^{\mu\nu} (D_\mu \Delta)^\dagger (D_\nu \Delta) - V(H, \Delta) + \mathcal{L}_{\text{Yukawa}}$$

$$h \equiv \frac{1}{\sqrt{2}}\rho_H e^{i\eta} \quad \Delta^0 \equiv \frac{1}{\sqrt{2}}\rho_\Delta e^{i\theta}$$

$$F(H, \Delta) = \xi_H |h|^2 + \xi_\Delta |\Delta^0|^2 = \frac{1}{2}\xi_H \rho_H^2 + \frac{1}{2}\xi_\Delta \rho_\Delta^2$$

SM+Type II seesaw

During inflation(Oleg Lebedev and Hyun Min Lee, arXiv:1105.2284)

$$\frac{\rho_H}{\rho_\Delta} \equiv \tan \alpha = \sqrt{\frac{2\lambda_\Delta \xi_H - \lambda_{H\Delta} \xi_\Delta}{2\lambda_H \xi_\Delta - \lambda_{H\Delta} \xi_H}}$$

$$\rho_H = \varphi \sin \alpha, \quad \rho_\Delta = \varphi \cos \alpha$$

$$\xi \equiv \xi_H \sin^2 \alpha + \xi_\Delta \cos^2 \alpha$$

Similar to SUSY case, but mixing with a general angle

SM+Type II seesaw

Finally the model can be simplified as

$$\frac{\mathcal{L}}{\sqrt{-g}} = -\frac{M_p^2}{2}R - \frac{\xi}{2}\varphi^2 R - \frac{1}{2}g^{\mu\nu}\partial_\mu\varphi\partial_\nu\varphi - \frac{1}{2}\varphi^2\cos^2\alpha g^{\mu\nu}\partial_\mu\theta\partial_\nu\theta - V(\varphi,\theta)$$

$$V(\varphi,\theta) = \frac{1}{2}m^2\varphi^2 + \frac{\lambda}{4}\varphi^4 + 2\varphi^3\left(\tilde{\mu} + \frac{\tilde{\lambda}_5}{M_p}\varphi^2\right)\cos\theta$$

We need keep the theta term, because

$$n_L = Q_L\varphi^2\dot{\theta}\cos^2\alpha$$

Lepton number generation

$$\xi = 300, \lambda = 4.5 \cdot 10^{-5}$$

$$\chi_0 = 6.0M_p, \dot{\chi}_0 = 0, \text{ and } \theta_0 = 0$$

- 暴胀开始轻子数为0
- 轻子数在暴胀过程中产生
- 暴胀结束后轻子数守恒

SM+Type II seesaw

$$T_{\text{reh}} \approx 2.2 \cdot 10^{14} \text{ GeV}$$

$$\eta_B = \left. \frac{n_B}{s} \right|_{\text{reh}} = \eta_B^{\text{obs}} \left(\frac{|n_{L_{\text{end}}}|/M_p^3}{1.3 \cdot 10^{-16}} \right) \left(\frac{g_*}{112.75} \right)^{-\frac{1}{4}}$$

$$\tilde{\lambda}_5 = 7 \cdot 10^{-15} \text{ for } \theta_0 = 0.1$$

Wash out process

$$\frac{\mu^2}{8\pi m_\Delta} < H(m) = \frac{m_\Delta^2}{M_P}$$

$$m_\Delta < 10^{12} \text{ GeV}$$

A small μ term is preferred

SM+Type II seesaw

- Triplet Higgs could be as light as TeV
- Vacuum value $< 10 \text{ keV}$, $y > 10^{-5}$ (traditional type II seesaw $< 1 \text{ GeV}$)

Phenomenology implications I: collider physics

Decay of the doubly-charged Higgs

$$\Delta M = m_{\Delta^{++}} - m_{\Delta^+}$$

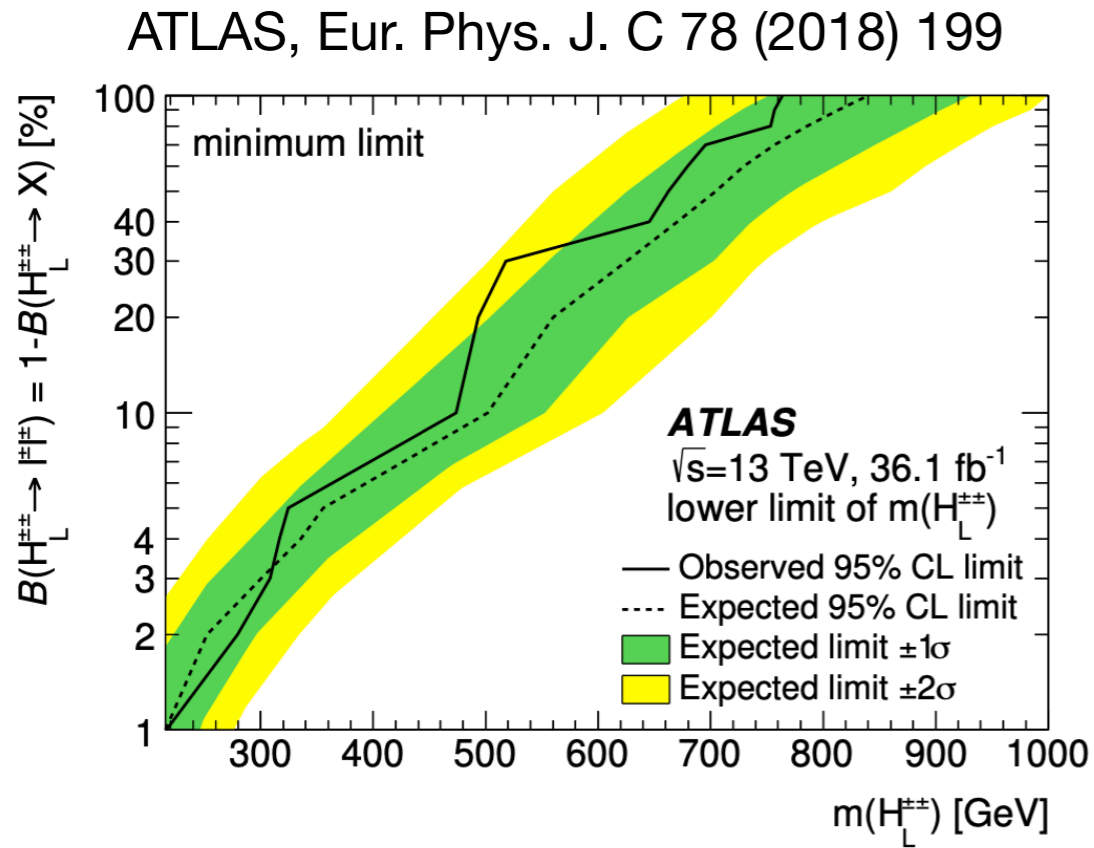

For $v > 1$ MeV, mainly decay gauge bosons

For $v < 0.1$ MeV, mainly decay leptons

Phenomenology implications I: collider physics

Current limit from LHC

Unitary problem for Higgs inflation

Cut-off grows with the field background

Jordan frame

Einstein frame

Relation between cut-offs in different frames:

$$\Lambda_{\text{Jordan}} = \Lambda_{\text{Einstein}} \Omega$$

Reheating temperature $M_P/\xi < T_{\text{reheating}} < M_P/\sqrt{\xi}$

Problems during reheating

Relevant scales at inflation

Hubble scale $H \sim \lambda^{1/2} \frac{M_P}{\xi}$

Energy density at inflation

$$V^{1/4} \sim \lambda^{1/4} \frac{M_P}{\sqrt{\xi}}$$

Instanton, sphaleron process

Effective for $T > 100 \text{ GeV}$

$$\exp\left(-\frac{M_{sph}(T)}{T}\right) \sim \exp\left(-2\pi \frac{M_W(T)}{\alpha_w T}\right)$$

$$\Gamma \propto \exp\left(-\frac{4\pi}{\alpha}\right)$$

Instanton, sphaleron

Baryon asymmetry via leptogenesis

1. the sphaleron interactions themselves:

$$\sum_i (3\mu_{q_i} + \mu_{\ell_i}) = 0$$

2. a similar relation for QCD sphalerons:

$$\sum_i (2\mu_{q_i} - \mu_{u_i} - \mu_{d_i}) = 0.$$

3. vanishing of the total hypercharge of the universe:

$$\sum_i (\mu_{q_i} - 2\mu_{\bar{u}_i} + \mu_{\bar{d}_i} - \mu_{\ell_i} + \mu_{\bar{e}_i}) + \frac{2}{N}\mu_H = 0$$

4. the quark and lepton Yukawa couplings give relations:

$$\mu_{q_i} - \mu_\phi - \mu_{d_j} = 0, \quad \mu_{q_i} - \mu_\phi - \mu_{u_j} = 0, \quad \mu_{\ell_i} - \mu_\phi - \mu_{e_j} = 0.$$

$$B = \frac{8N + 4}{22N + 13} (\mathcal{B} - \mathcal{L})_i$$

Adding non-minimal coupling

Similar idea of Higgs inflation

Bezrukov and Shaposhnikov, Phys.Lett.B 659 (2008) 703-706

$$S_J = \int d^4x \sqrt{-g_J} \left[\frac{M_P^2}{2} \left(1 + \frac{\xi \phi^2}{M_P^2} \right) R_J - \frac{1}{2} |\partial_\mu \phi|^2 - V_J(\phi) \right]$$

Weyl transformation

$$g_{\mu\nu} = \Omega(\phi)^2 g_{J\mu\nu} \quad \Omega^2 = 1 + \frac{\xi \phi^2}{M_P^2}$$
