

EFFECTIVE FIELD THEORY FOR NEUTRINOLESS DOUBLE BETA DECAY

Jordy de Vries
University of Amsterdam & Nikhef

EFTs and neutrino mass: an old story

- Neutrinos are formally massless in the SM \rightarrow but neutrino oscillations
- Easy fix: Insert gauge-singlet right-handed neutrino ν_R

$$\mathcal{L} = -y_\nu \bar{L} \tilde{H} \nu_R \quad y_\nu \sim 10^{-12} \rightarrow m_\nu \sim 0.1 \text{ eV}$$

- Nothing really wrong with this.... **But nothing forbids a Majorana Mass term**

$$\mathcal{L} = -y_\nu \bar{L} \tilde{H} \nu_R - M_R \nu_R^T C \nu_R$$

'Everything that is not forbidden is compulsory'

EFTs and neutrino mass: an old story

- Neutrinos are formally massless in the SM \rightarrow but neutrino oscillations
- Easy fix: Insert gauge-singlet right-handed neutrino ν_R

$$\mathcal{L} = -y_\nu \bar{L} \tilde{H} \nu_R \quad y_\nu \sim 10^{-12} \rightarrow m_\nu \sim 0.1 \text{ eV}$$

- Nothing really wrong with this.... **But nothing forbids a Majorana Mass term**

$$\mathcal{L} = -y_\nu \bar{L} \tilde{H} \nu_R - M_R \nu_R^T C \nu_R$$

'Everything that is not forbidden is compulsory'

- If M_R is significantly larger than active neutrino masses ($< \text{eV}$) : **see-saw mechanism**

- In case of 1 left and 1 right-handed neutrino: $m_1 \simeq \left| \frac{y_\nu^2 v^2}{m_R} \right| \quad m_2 \simeq m_R$

- The mass eigenstates are Majorana states $\nu_i^c = \nu_i$

- Violation of **lepton number** by two units \rightarrow **neutrinoless double beta decay**

EFT point of view

- Integrating out heavy states leads to local operator

- Obtain the single dimension-5 SMEFT operator

$$\mathcal{L}_5 = \frac{c_5}{\Lambda} (L^T C \tilde{H}) (\tilde{H}^T L)$$

Neutrino Majorana mass

$$\mathcal{L}_5 = c_5 \frac{v^2}{\Lambda} \nu^T C \nu$$

Weinberg '79

$$c_5 = y_\nu^2$$

EFT point of view

- Integrating out heavy states leads to local operator

- Obtain the single dimension-5 SMEFT operator

Neutrino Majorana mass

Weinberg '79

$$\mathcal{L}_5 = \frac{c_5}{\Lambda} (L^T C \tilde{H})(\tilde{H}^T L)$$

$$\mathcal{L}_5 = c_5 \frac{v^2}{\Lambda} \nu^T C \nu$$

$$c_5 = y_\nu^2$$

Dimension-five	Dimension-seven	Dimension-nine
$\mathcal{L}_5 = \frac{c_5}{\Lambda} (L^T C \tilde{H})(\tilde{H}^T L)$ <ul style="list-style-type: none"> One operator Induces Majorana mass 	<p>1: $\psi^2 H^4 + \text{h.c.}$</p> <p>$\mathcal{O}_{LH} \epsilon_{ij} \kappa_{mn} (L^i C L^j)^m H^i H^n (H^i H^j)$</p> <p>3: $\psi^2 H^3 D + \text{h.c.}$</p> <p>$\mathcal{O}_{LHD} \epsilon_{ij} \kappa_{mn} (L^i C \gamma_\mu L^j)^m H^i H^n D^\mu H^m$</p> <p>5: $\psi^4 D + \text{h.c.}$</p> <p>$\mathcal{O}_{LQd}^{(1)} \epsilon_{ij} (\partial_\mu \gamma_\nu) (L^i C D^\mu L^j)$</p> <p>$\mathcal{O}_{LQd}^{(2)} \epsilon_{ij} (\partial_\mu \gamma_\nu) (L^i C \gamma^\mu D_\nu L^j)$</p> <p>$\mathcal{O}_{LQd}^{(3)} (Q C \gamma_\mu d) (\bar{L} D^\mu d)$</p> <p>$\mathcal{O}_{LQd}^{(4)} (L \gamma_\mu Q) (d C D^\mu d)$</p> <p>$\mathcal{O}_{LQd}^{(5)} (\partial_\mu d) (d C D^\mu d)$</p> <p>Lehman '14</p> <p>2: $\psi^2 H^2 X + \text{h.c.}$</p> <p>$\mathcal{O}_{LH}^{(1)} \epsilon_{ij} \kappa_{mn} (L^i C D^\mu L^j)^m H^i H^n (D_\mu H^m)$</p> <p>$\mathcal{O}_{LH}^{(2)} \epsilon_{ij} \kappa_{mn} (L^i C D^\mu L^j)^m H^i H^n (D_\mu H^m)$</p> <p>4: $\psi^2 H^2 X + \text{h.c.}$</p> <p>$\mathcal{O}_{LH} \epsilon_{ij} \kappa_{mn} (L^i C \gamma_\mu L^j)^m H^i H^n D^\mu H^m$</p> <p>$\mathcal{O}_{LHW} \epsilon_{ij} (\gamma^\mu \gamma_\nu) (L^i C \gamma_\mu L^j)^m H^i H^n W^{\nu\rho}$</p> <p>6: $\psi^4 W + \text{h.c.}$</p> <p>$\mathcal{O}_{LQd} \epsilon_{ij} \kappa_{mn} (L^i C L^j)^m H^i H^n D^\mu H^m$</p> <p>$\mathcal{O}_{LQd}^{(1)} \epsilon_{ij} \kappa_{mn} (L^i C L^j)^m H^i H^n D^\mu H^m$</p> <p>$\mathcal{O}_{LQd}^{(2)} \epsilon_{ij} \kappa_{mn} (L^i C L^j)^m H^i H^n D^\mu H^m$</p> <p>$\mathcal{O}_{LQd}^{(3)} \epsilon_{ij} \kappa_{mn} (L^i C L^j)^m H^i H^n D^\mu H^m$</p> <p>$\mathcal{O}_{LQd}^{(4)} \epsilon_{ij} \kappa_{mn} (L^i C L^j)^m H^i H^n D^\mu H^m$</p> <p>$\mathcal{O}_{LQd}^{(5)} \epsilon_{ij} \kappa_{mn} (L^i C L^j)^m H^i H^n D^\mu H^m$</p> <p>$\mathcal{O}_{LQd}^{(6)} \epsilon_{ij} \kappa_{mn} (L^i C L^j)^m H^i H^n D^\mu H^m$</p> <p>$\mathcal{O}_{LQd}^{(7)} \epsilon_{ij} \kappa_{mn} (L^i C L^j)^m H^i H^n D^\mu H^m$</p> <p>$\mathcal{O}_{LQd}^{(8)} \epsilon_{ij} \kappa_{mn} (L^i C L^j)^m H^i H^n D^\mu H^m$</p> <p>$\mathcal{O}_{LQd}^{(9)} \epsilon_{ij} \kappa_{mn} (L^i C L^j)^m H^i H^n D^\mu H^m$</p> <p>$\mathcal{O}_{LQd}^{(10)} \epsilon_{ij} \kappa_{mn} (L^i C L^j)^m H^i H^n D^\mu H^m$</p> <p>$\mathcal{O}_{LQd}^{(11)} \epsilon_{ij} \kappa_{mn} (L^i C L^j)^m H^i H^n D^\mu H^m$</p> <p>$\mathcal{O}_{LQd}^{(12)} \epsilon_{ij} \kappa_{mn} (L^i C L^j)^m H^i H^n D^\mu H^m$</p> <p>• 12 $\Delta L=2$ operators</p>	<p>Li et al '20</p> <p>Many many terms</p> <p>19 4-quark 2-lepton operators after EWSB</p> <p>Graesser et al '17 '18</p>

Applications effective field theory in $0\nu\beta\beta$

- 1. Use EFT to scrutinize and guide nuclear calculations (focus here on Weinberg operator)**
- 2. Investigate non-standard mechanisms (beyond Weinberg term)**
3. Use EFTs in presence of explicit light degrees of freedom (sterile neutrinos)

Leading-order transition currents

- Neutrinos are still degrees of freedom in low-energy chiral EFT
- Leads to 'long-range' $nn \rightarrow pp + ee$

$$V_\nu \sim \frac{m_{\beta\beta}}{\mathbf{q}^2}$$

$$\mathbf{q} \sim k_F \sim m_\pi$$

$$V_\nu = (2G_F^2 m_{\beta\beta}) \tau_1^+ \tau_2^+ \frac{1}{\mathbf{q}^2} \left[(1 + 2g_A^2) + \frac{g_A^2 m_\pi^4}{(\mathbf{q}^2 + m_\pi^2)} \right] \otimes \bar{e}_L e_L^c$$

- Note: the nucleons appear in a bound state and \mathbf{q} is a loop momentum
- Then insert this into nuclear wave functions (from **nuclear many-body** methods)

$$A_\nu \sim \langle \Psi | V_\nu | \Psi \rangle$$

Leading-order transition currents

- Neutrinos are still degrees of freedom in low-energy chiral EFT
- Leads to 'long-range' $nn \rightarrow pp + ee$

$$V_\nu \sim \frac{m_{\beta\beta}}{\mathbf{q}^2}$$

$$\mathbf{q} \sim k_F \sim m_\pi$$

$$V_\nu = (2G_F^2 m_{\beta\beta}) \tau_1^+ \tau_2^+ \frac{1}{\mathbf{q}^2} \left[(1 + 2g_A^2) + \frac{g_A^2 m_\pi^4}{(\mathbf{q}^2 + m_\pi^2)} \right] \otimes \bar{e}_L e_L^c$$

- Contributions from virtual hard neutrinos $\mathbf{q} \sim \Lambda_\chi \sim 1 \text{ GeV}$

- Naive-dimensional analysis tells us this is higher-order

$$V_\nu^{\text{short}} \sim \frac{m_{\beta\beta}}{\Lambda_\chi^2} \ll V_\nu$$

Leading-order transition currents

- Neutrinos are still degrees of freedom in low-energy chiral EFT
- Leads to 'long-range' $nn \rightarrow pp + ee$

$$V_\nu \sim \frac{m_{\beta\beta}}{q^2}$$

$$q \sim k_F \sim m_\pi$$

- More contributions at higher orders in chiral perturbation theory

- Loops at N²LO are divergent: come with counter terms

$$V_\nu^{N^2LO} \sim \left(V_{\text{finite}} + V_{UV} \log \frac{m_\pi^2}{\mu^2} + V_{CT} \right) \otimes \bar{e}_L e_L^c$$

- Divergences absorbed by counter terms

Cirigliano, Dekens, Mereghetti, Walker-Loud '17

- At higher orders also 'closure corrections' and three-body effects

e.g. Engel et al '18

Leading-order transition currents

$$V_\nu = (2G_F^2 m_{\beta\beta}) \tau_1^+ \tau_2^+ \frac{1}{\mathbf{q}^2} \left[(1 + 2g_A^2) + \frac{g_A^2 m_\pi^4}{(\mathbf{q}^2 + m_\pi^2)} \right] \otimes \bar{e}_L e_L^c$$

- Leading-order $0\nu\beta\beta$ current is very simple
- No unknown hadronic input ! Only unknown is $m_{\beta\beta}$

Leading-order transition currents

$$V_\nu = (2G_F^2 m_{\beta\beta}) \tau_1^+ \tau_2^+ \frac{1}{\mathbf{q}^2} \left[(1 + 2g_A^2) + \frac{g_A^2 m_\pi^4}{(\mathbf{q}^2 + m_\pi^2)} \right] \otimes \bar{e}_L e_L^c$$

- Leading-order $0\nu\beta\beta$ current is very simple
- No unknown hadronic input ! Only unknown is $m_{\beta\beta}$
- Many-body methods disagree significantly
- Idea: see what happens for lighter systems
- **Not relevant for experiments but as a theoretical laboratory**

Neutron-Neutron \rightarrow Proton-Proton

- Study simplest nuclear process: $nn \rightarrow pp + ee$

Cirigliano, Dekens, JdV, Graesser, Mereghetti, Pastore van Kolck, PRL '18

Cirigliano, Dekens, JdV, Hoferichter, Mereghetti PRL '21

Neutron-Neutron \rightarrow Proton-Proton

- Study simplest nuclear process: $nn \rightarrow pp + ee$

- Derive wave functions from chiral effective field theory $T = V + V G_0 T$

$$V_{\text{strong}} = C_0 - \frac{g_A^2}{4f_\pi^2} \frac{m_\pi^2}{\mathbf{q}^2 + m_\pi^2}$$

Weinberg 90' 91'

- To solve Schrodinger equation need regulator $V_{\text{strong}} \rightarrow e^{-p^6/\Lambda^6} \times V_{\text{strong}} \times e^{-p'^6/\Lambda^6}$

- **Dim-reg possible** as well but much more complicated.

Neutron-Neutron → Proton-Proton

$$V_{\text{strong}} = C_0 - \frac{g_A^2}{4f_\pi^2} \frac{m_\pi^2}{\mathbf{q}^2 + m_\pi^2}$$

Weinberg 90' 91'

- Fit counter terms to nucleon-nucleon scattering lengths for each Λ
- Predict cross sections (phase shifts) for other energies.

Leading-order transition currents

- Insert long-distance neutrino exchange into scattering states

$$\sim (1 + 2g_A^2) \left(\frac{m_N C_0}{4\pi} \right)^2 \left(\frac{1}{\epsilon} + \log \frac{\mu^2}{p^2} \right)$$

New divergences

Leading-order transition currents

- Insert long-distance neutrino exchange into scattering states

$$\sim (1 + 2g_A^2) \left(\frac{m_N C_0}{4\pi} \right)^2 \left(\frac{1}{\epsilon} + \log \frac{\mu^2}{p^2} \right)$$

New divergences

- **Logarithmic regulator dependence**
- Divergence indicates sensitivity to short-distance physics (hard-neutrino exchange)
- Requires a counter term: a short-range $nn \rightarrow pp + ee$ operator

A new leading-order contribution

‘Long-range’ neutrino-exchange

‘Short-distance’ neutrino exchange required by renormalization of amplitude

- **Short-distance piece depends on unknown QCD matrix element g_ν**

- How to determine the value of this matrix element? Obviously no data!

- **Lattice QCD can do this in the future. But not yet....**

Davoudi, Kadam PRL '21 Briceno et al '19 '20

- But solved already for the ‘toy-problem’

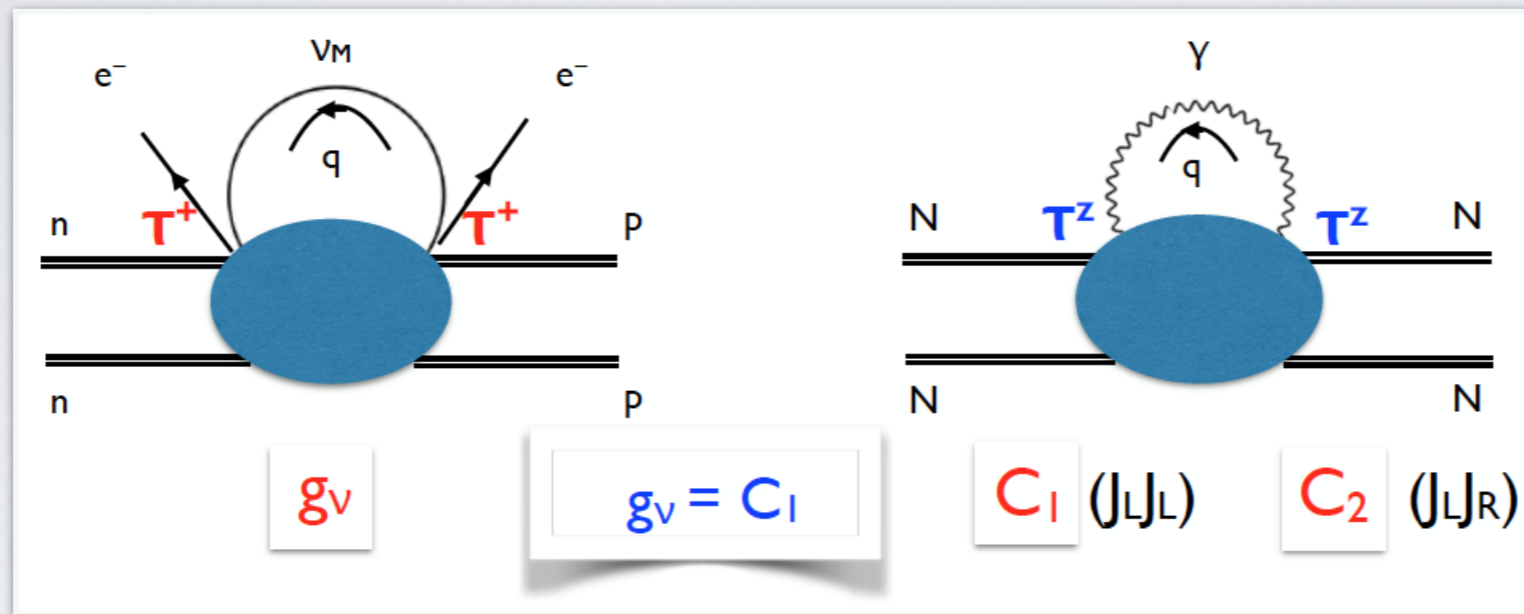

Tremendous progress for the ‘toy-problem’

$$\pi^- + \pi^- \rightarrow e^- + e^-$$

Tuo et al. '19; Detmold, Murphy '20 '22

A connection to electromagnetism

- A neutrino-exchange process looks like a photon-exchange process

Cirigliano et al '19

- Isospin-breaking nucleon-nucleon scattering data determines $C_1 + C_2$
- Electromagnetism conserves parity (L + R) coupling and $g_v \sim C_1$ only

- Large- N_c arguments indicates $C_1 + C_2 \gg C_1 - C_2$ Richardson, Schindler, Pastore, Springer '21

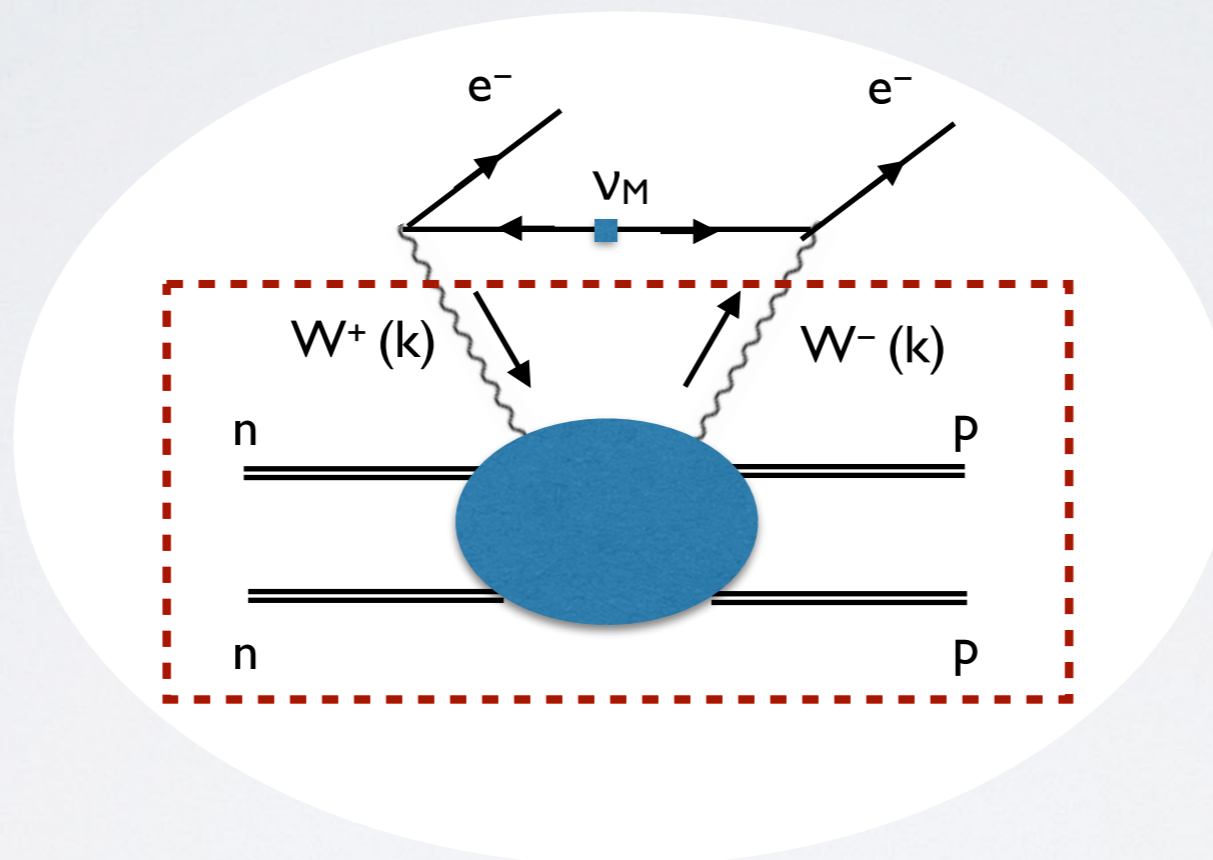

- **In this way, we can extract g_v from data.**

An analytic approach

- The $nn \rightarrow pp + ee$ amplitude can be represented as an integral expression

$$A_\nu \sim G_F^2 \int \frac{d^4k}{(2\pi)^4} \frac{g_{\mu\nu}}{k^2} \int d^4x e^{ik \cdot x} \langle pp | T \{ J_W^\mu(x) J_W^\nu(0) \} | nn \rangle$$

$J_W^\mu =$ weak current (V-A)

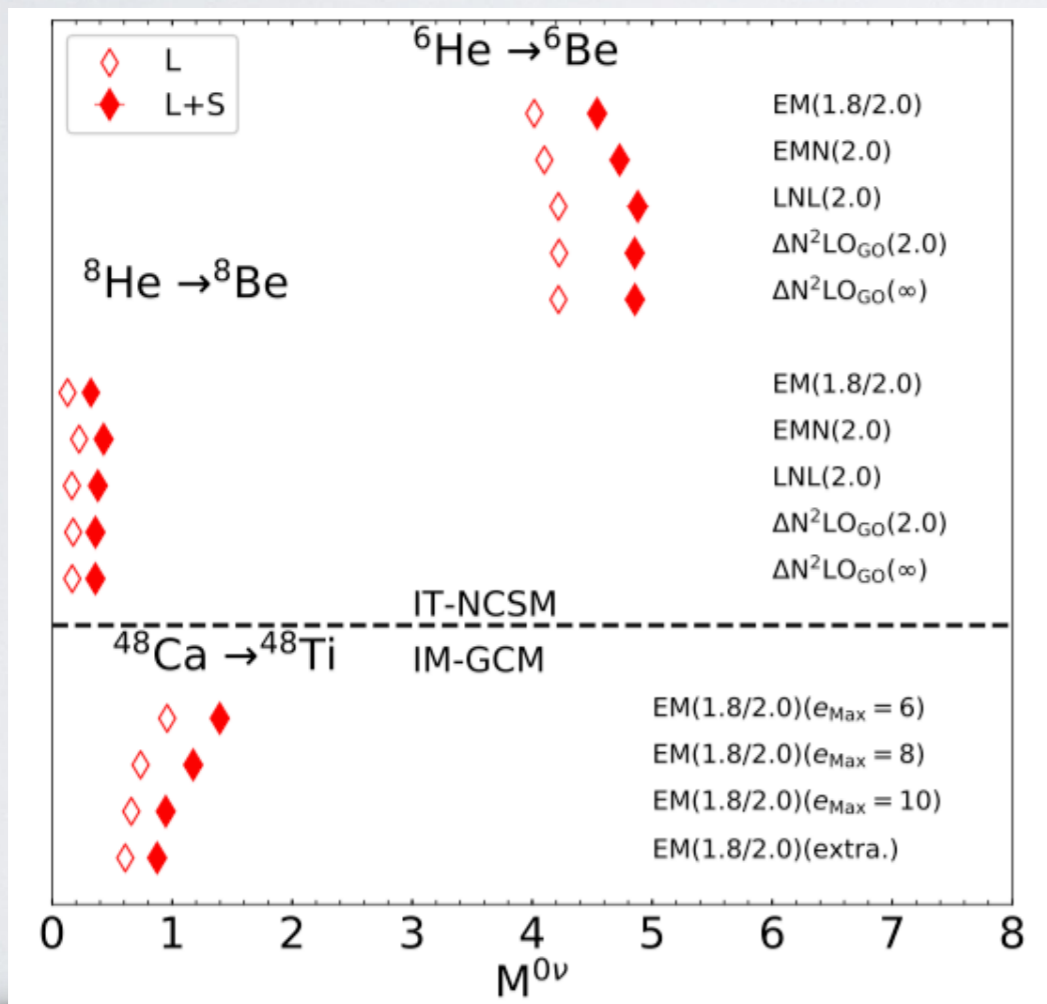

- Can represent the `red box' in regions of the virtual neutrino momentum k
- Skip the details but analysis agree with CIB extraction**

Impact on realistic nucleus

- **First calculations now include this heavier nuclei**
- N3LO chiral nucleon-nucleon potential with certain regulator
- Fit short-distance g_ν to synthetic data
- Similarity Renormalization Group transformation to perform many-body computations

- Bigger effect for $I=2$ transitions due to node
 - $\sim 100\%$ for ${}^8\text{He}$
 - $\sim 60\%$ for ${}^{48}\text{Ca}$

${}^{48}\text{Ca}$ decay rate increases by factor >2

Enhanced sensitivity to neutrino Majorana mass

Similar enhancements found for ${}^{76}\text{Ge}$ and ${}^{136}\text{Xe}$ (Menendez et al '22)

Other mechanism of $0\nu\beta\beta$

- **Many beyond-the-SM model induce different $0\nu\beta\beta$ mechanism**
- Examples: Left-right symmetry, supersymmetry, leptoquarks,

Other mechanism of 0vbb

- **Many beyond-the-SM model induce different 0vbb mechanism**
- Examples: Left-right symmetry, supersymmetry, leptoquarks,

- **If new fields are heavy, can use effective field theory !**

Higher-dimensional operators

- Effective operators appear at odd dimension (5, 7, 9, ...) Kobach '16

Dimension-five	Dimension-seven	Dimension-nine																				
$\mathcal{L}_5 = \frac{c_5}{\Lambda} (L^T C \tilde{H}) (\tilde{H}^T L)$ <ul style="list-style-type: none"> One operator Induces Majorana mass 	<p style="text-align: center;">Lehman '14</p> <p>1: $\psi^2 H^4 + \text{h.c.}$</p> $\mathcal{O}_{LH} \quad \epsilon_{ij} \kappa_{mn} (L^i C L^m) H^j H^n (H^i H)$ <p>3: $\psi^2 H^3 D + \text{h.c.}$</p> $\mathcal{O}_{LHD} \quad \epsilon_{ij} \kappa_{mn} (L^i C \gamma_\mu \epsilon) H^j H^m D^\mu H^n$ <p>5: $\psi^4 D + \text{h.c.}$</p> <table border="0"> <tr> <td>$\mathcal{O}_{LLDD}^{(1)}$</td> <td>$\epsilon_{ij} (\partial_\mu \gamma_\nu) (L^i C D^\mu L^j)$</td> <td>$\mathcal{O}_{LLDD}^{(2)}$</td> <td>$\epsilon_{ij} (\partial_\mu \gamma_\nu) (L^i C D^\mu L^j)$</td> </tr> <tr> <td>$\mathcal{O}_{LLDD}^{(2)}$</td> <td>$\epsilon_{ij} (\partial_\mu \gamma_\nu) (L^i C \partial^\mu D_\nu L^j)$</td> <td>$\mathcal{O}_{LLDD}^{(3)}$</td> <td>$\epsilon_{ij} (\partial_\mu \gamma_\nu) (L^i C \partial^\mu L^j)$</td> </tr> <tr> <td>$\mathcal{O}_{LQDD}^{(1)}$</td> <td>$(Q C \gamma_\mu d) (\tilde{L} D^\mu d)$</td> <td>$\mathcal{O}_{LQDD}^{(2)}$</td> <td>$(Q C \gamma_\mu d) (\tilde{L} D^\mu d)$</td> </tr> <tr> <td>$\mathcal{O}_{LQDD}^{(2)}$</td> <td>$(\tilde{L} \gamma_\mu Q) (d C D^\mu d)$</td> <td>$\mathcal{O}_{LQDD}^{(3)}$</td> <td>$(\tilde{L} \gamma_\mu Q) (d C D^\mu d)$</td> </tr> <tr> <td>$\mathcal{O}_{LQDD}^{(3)}$</td> <td>$(\partial_\mu \gamma_\nu d) (d C D^\mu d)$</td> <td>$\mathcal{O}_{LQDD}^{(4)}$</td> <td>$(\partial_\mu \gamma_\nu d) (d C D^\mu d)$</td> </tr> </table> <p>• 12 $\Delta L=2$ operators</p>	$\mathcal{O}_{LLDD}^{(1)}$	$\epsilon_{ij} (\partial_\mu \gamma_\nu) (L^i C D^\mu L^j)$	$\mathcal{O}_{LLDD}^{(2)}$	$\epsilon_{ij} (\partial_\mu \gamma_\nu) (L^i C D^\mu L^j)$	$\mathcal{O}_{LLDD}^{(2)}$	$\epsilon_{ij} (\partial_\mu \gamma_\nu) (L^i C \partial^\mu D_\nu L^j)$	$\mathcal{O}_{LLDD}^{(3)}$	$\epsilon_{ij} (\partial_\mu \gamma_\nu) (L^i C \partial^\mu L^j)$	$\mathcal{O}_{LQDD}^{(1)}$	$(Q C \gamma_\mu d) (\tilde{L} D^\mu d)$	$\mathcal{O}_{LQDD}^{(2)}$	$(Q C \gamma_\mu d) (\tilde{L} D^\mu d)$	$\mathcal{O}_{LQDD}^{(2)}$	$(\tilde{L} \gamma_\mu Q) (d C D^\mu d)$	$\mathcal{O}_{LQDD}^{(3)}$	$(\tilde{L} \gamma_\mu Q) (d C D^\mu d)$	$\mathcal{O}_{LQDD}^{(3)}$	$(\partial_\mu \gamma_\nu d) (d C D^\mu d)$	$\mathcal{O}_{LQDD}^{(4)}$	$(\partial_\mu \gamma_\nu d) (d C D^\mu d)$	<p>Li et al '20</p> <p>Many many terms</p> <p>19 4-quark 2-lepton operators after EWSB</p> <p>Graesser et al '17 '18</p>
$\mathcal{O}_{LLDD}^{(1)}$	$\epsilon_{ij} (\partial_\mu \gamma_\nu) (L^i C D^\mu L^j)$	$\mathcal{O}_{LLDD}^{(2)}$	$\epsilon_{ij} (\partial_\mu \gamma_\nu) (L^i C D^\mu L^j)$																			
$\mathcal{O}_{LLDD}^{(2)}$	$\epsilon_{ij} (\partial_\mu \gamma_\nu) (L^i C \partial^\mu D_\nu L^j)$	$\mathcal{O}_{LLDD}^{(3)}$	$\epsilon_{ij} (\partial_\mu \gamma_\nu) (L^i C \partial^\mu L^j)$

- Higher-dimensional terms only relevant if dim-5 operator are suppressed
- Example: in left-right symmetric models

$$c_5 \sim y_e^2 \sim 10^{-10}$$

$$c_7 \sim y_e^1 \sim 10^{-5}$$

$$c_9 \sim y_e^0 \sim 1$$

- If scale is not too high:

$$\frac{v^2}{\Lambda^2} \sim y_e \rightarrow \Lambda \simeq (10 - 100) \text{ TeV}$$

- Dim-7 or dim-9 can dominate low-energy phenomenology !**

Example dim-7 operators

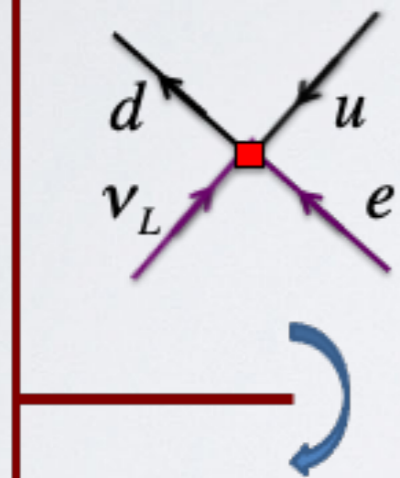

Integrate out heavy SM field and Higgs takes vev

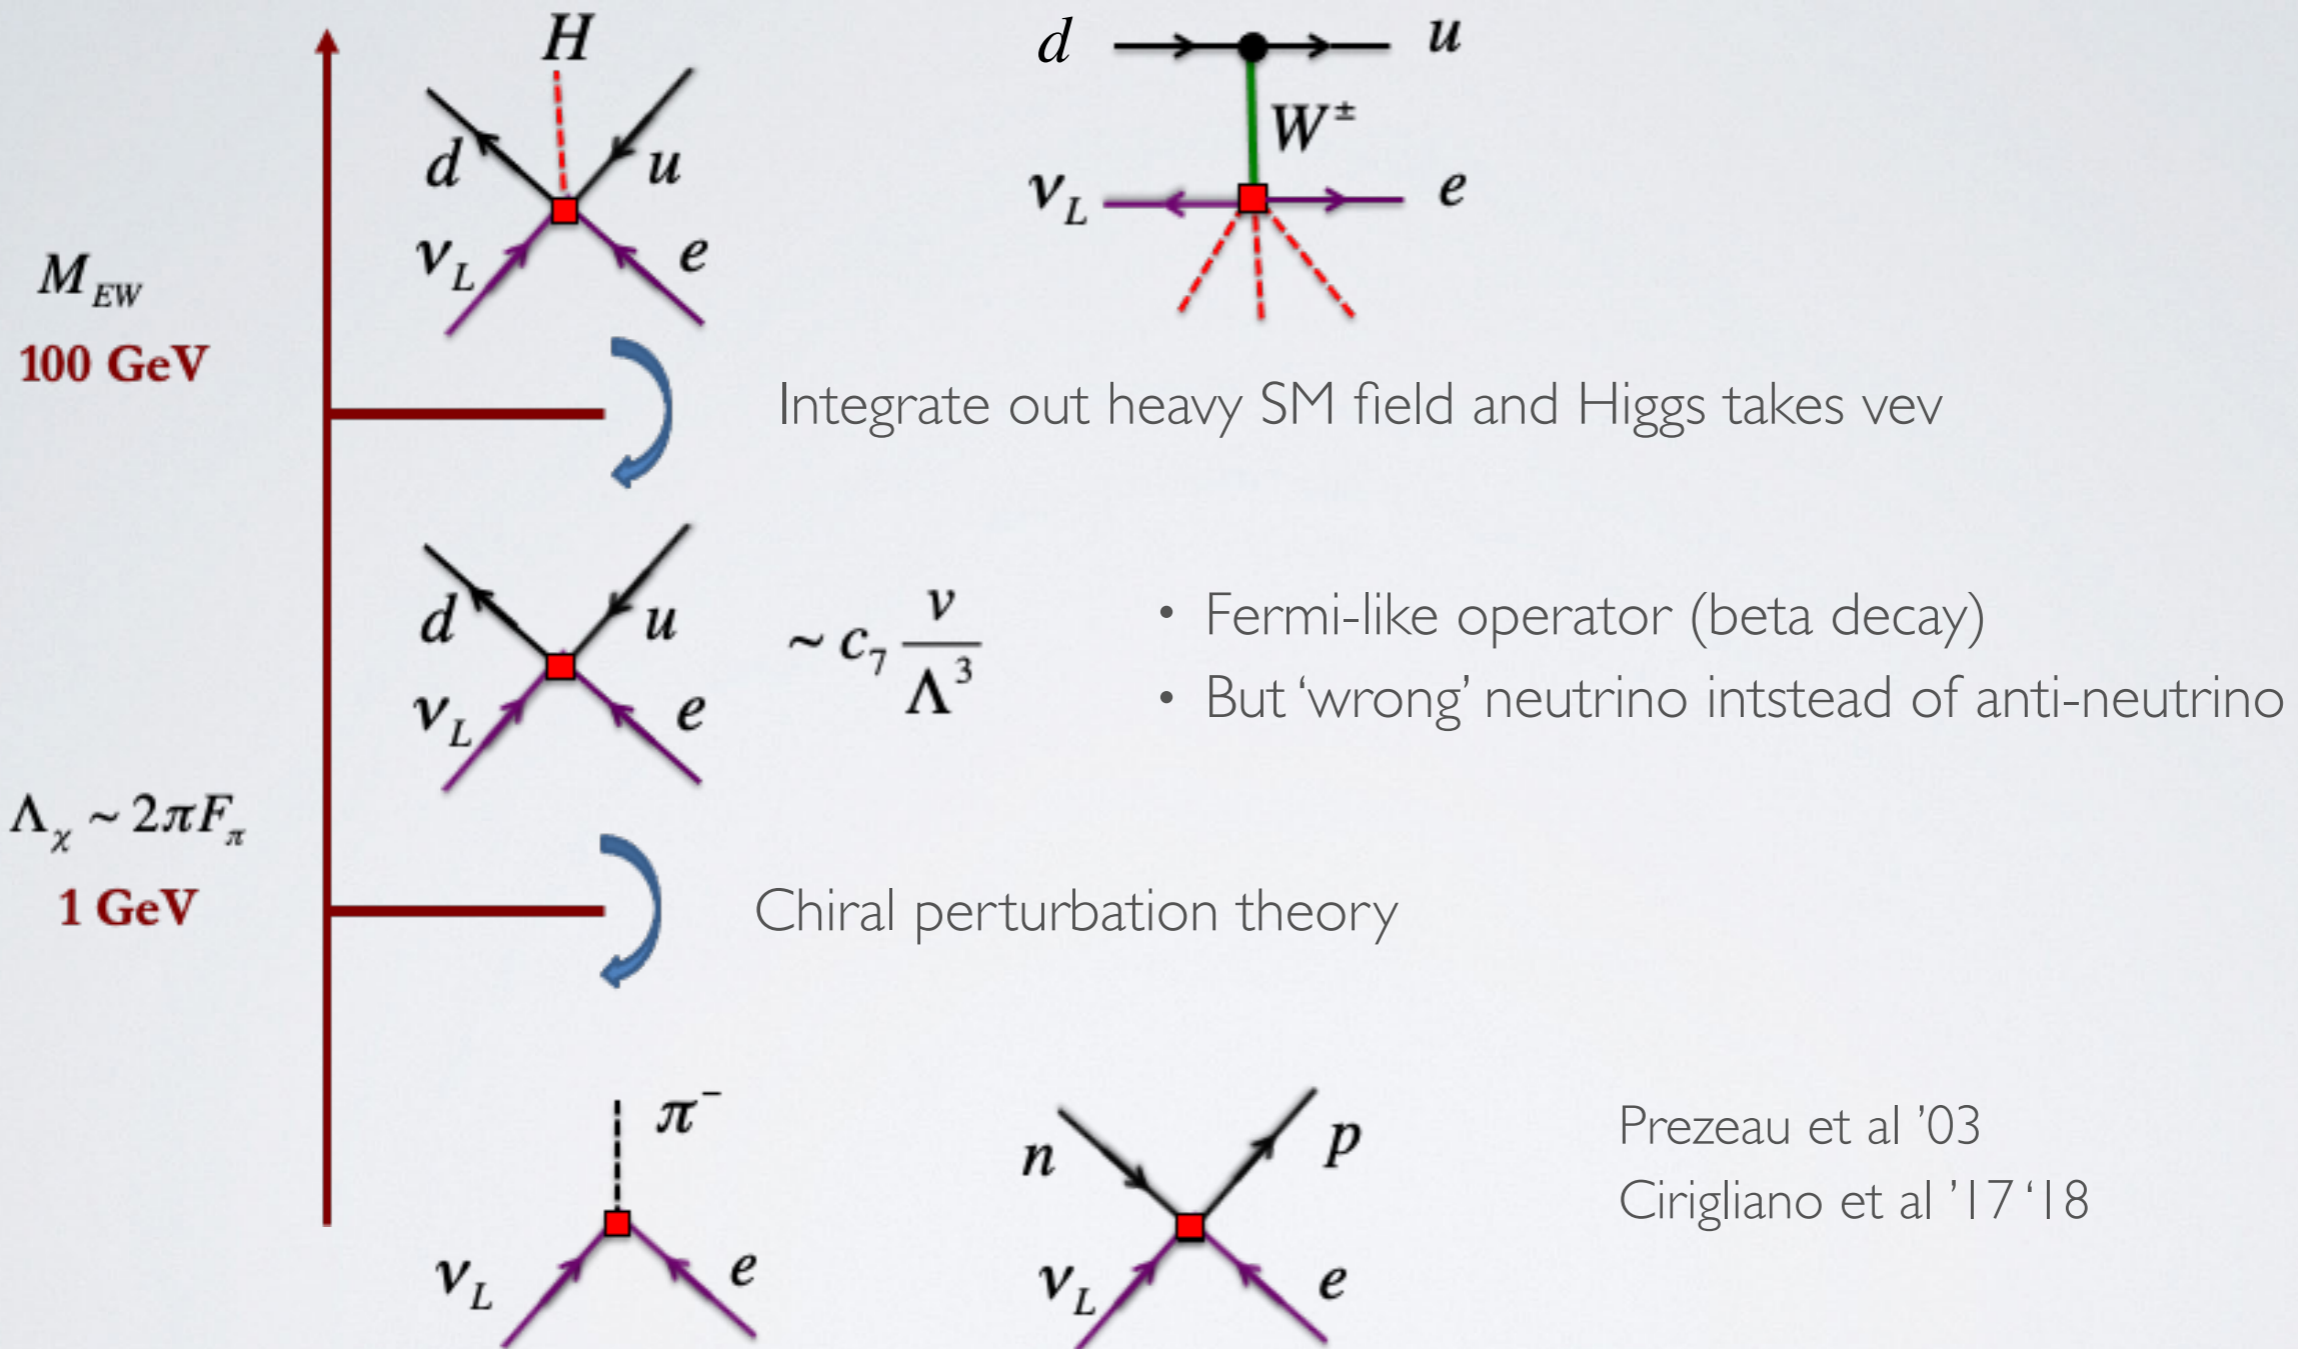

$$\sim c_7 \frac{v}{\Lambda^3}$$

- Fermi-like operator (beta decay)
- But 'wrong' neutrino instead of anti-neutrino

$\Lambda_\chi \sim 2\pi F_\pi$
1 GeV

Example dim-7 operators

Associated low-energy constants well known (nucleon charges $g_{A,S,T,V}$)

Example dim-9 operators

M_{EW}
100 GeV

$\Lambda_\chi \sim 2\pi F_\pi$
1 GeV

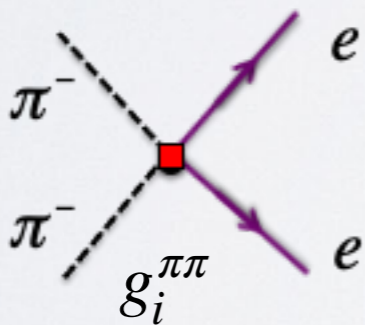

- Four-quark 2-lepton operators
- Neutrinoless interactions

Chiral perturbation theory

Prezeau et al '03

- Often missed in literature which uses factorization methods ($O(100)$ error on decay rate)
- Depend on four-quark matrix elements: great improvements by CalLat and MIT groups

$$g_4^{\pi\pi} = - (1.9 \pm 0.2) \text{ GeV}^2$$

$$g_5^{\pi\pi} = - (8.0 \pm 0.6) \text{ GeV}^2$$

Nicholson et al '18

New 0vbb topologies

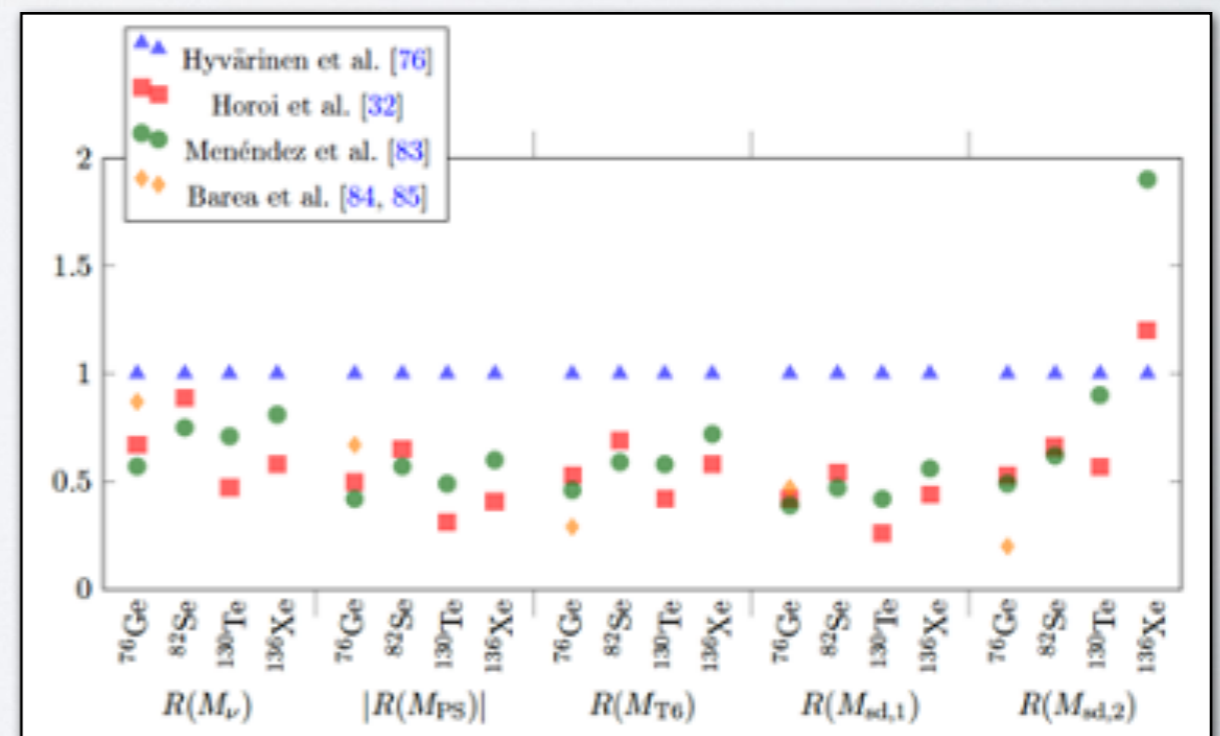

- Straightforward to calculate generalized 0vbb transition current Cirigliano et al '17 '18
- Need additional nuclear matrix elements (NMEs)

New 0νbb topologies

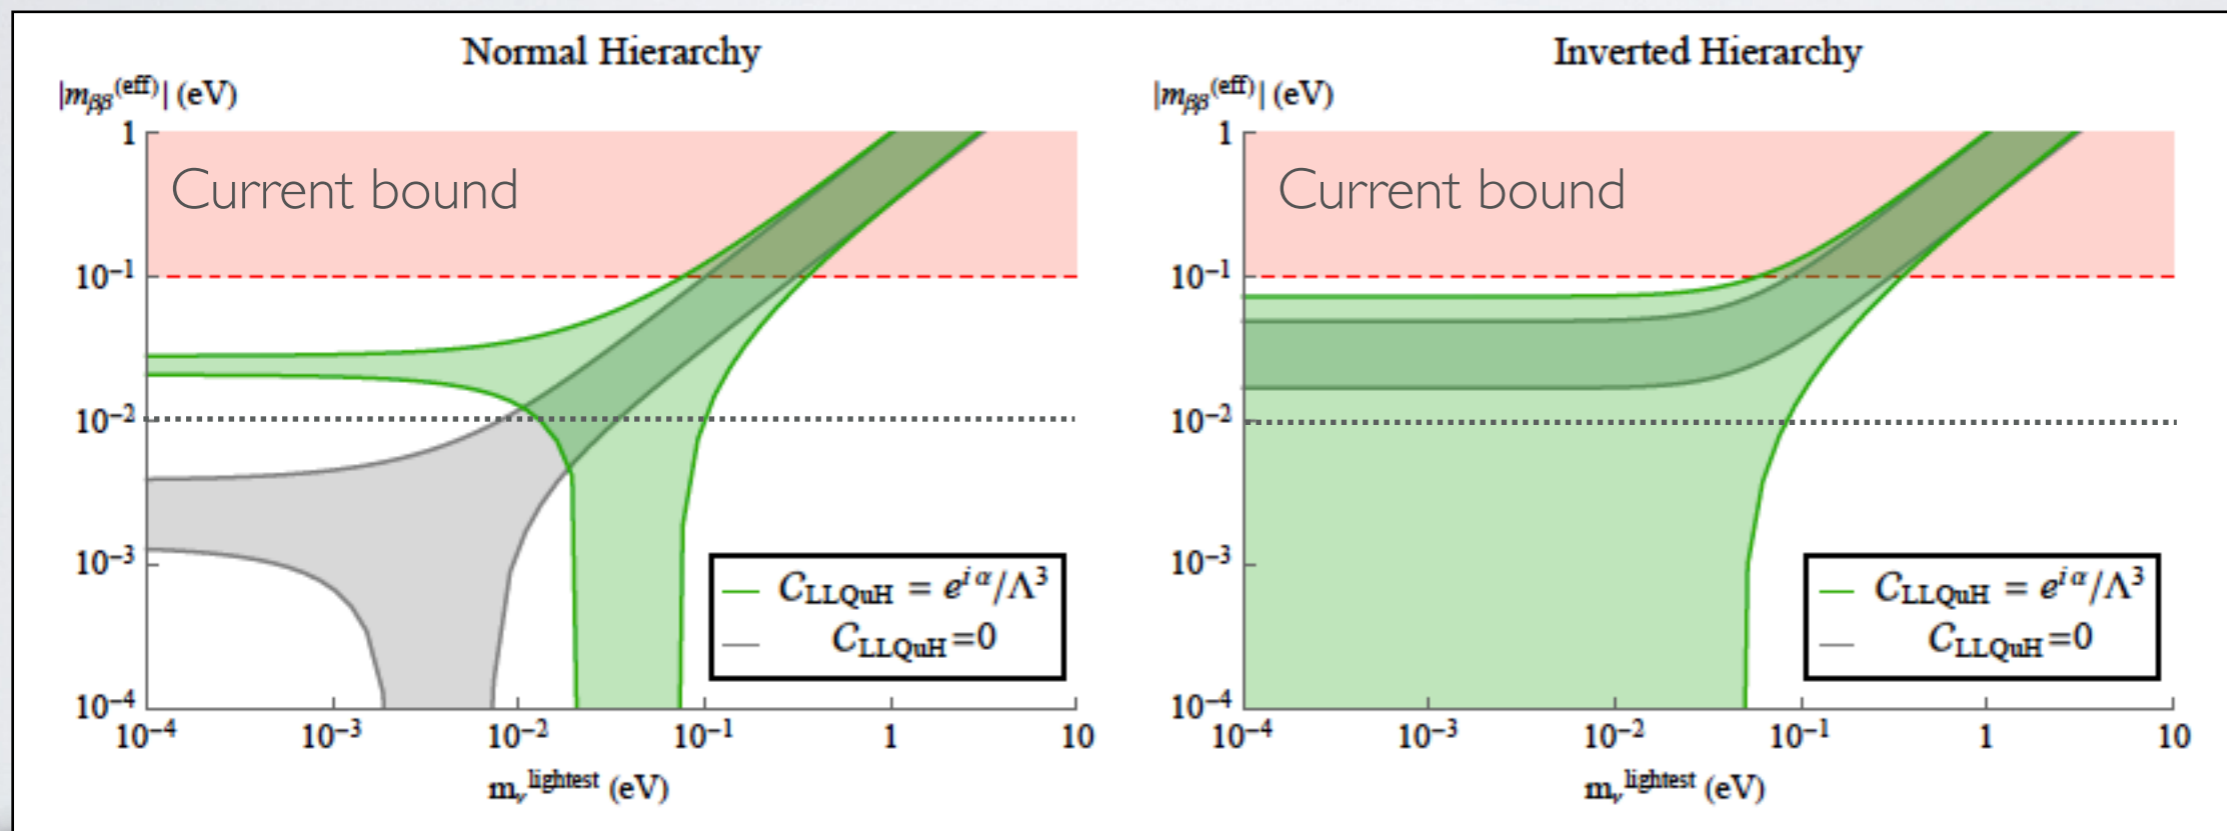

- Straightforward to calculate generalized 0νbb transition current Cirigliano et al '17 '18
- Need additional nuclear matrix elements (NMEs)
- **At leading-order in Chiral-EFT: 15 NMEs (all in literature)**
- Similar uncertainties as before

Using the framework

- Example: a model of heavy leptoquarks (LHC probes ~ 1 TeV leptoquarks roughly)

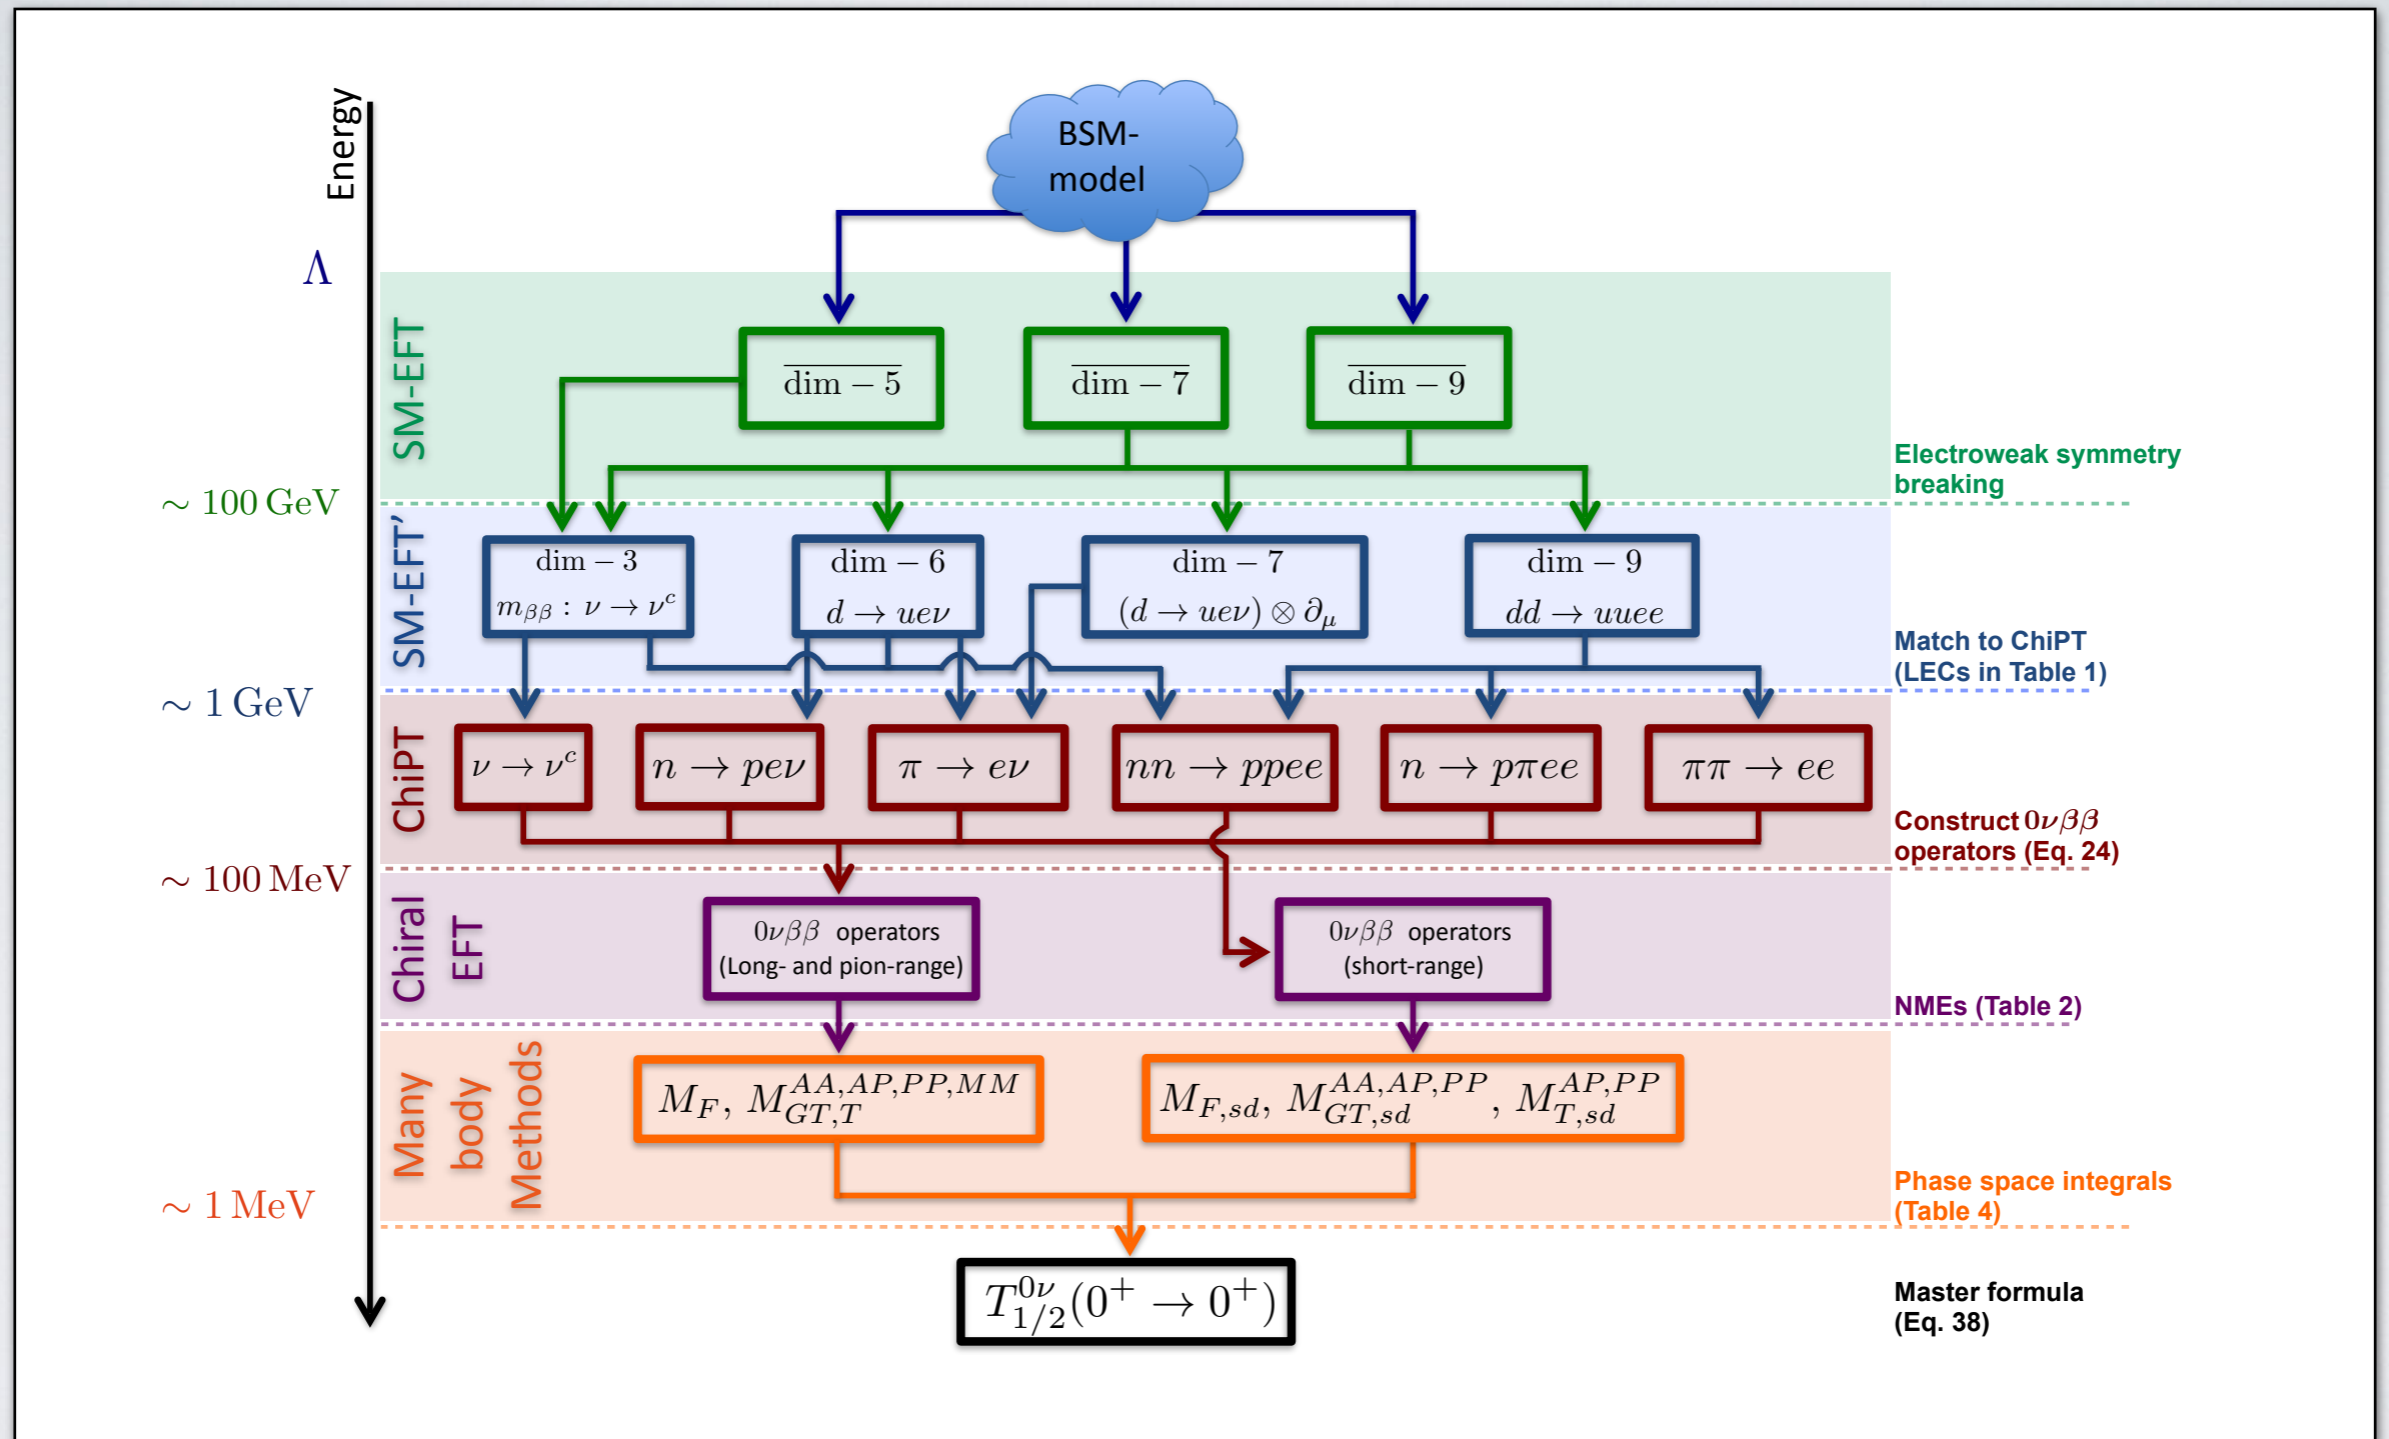

Ton-scale expectations

- Dramatic impact on $0\nu\beta\beta$ phenomenology !
- Sensitivity to 500-TeV new physics scales

The $0\nu\beta\beta$ metro map

Cirigliano, Dekens, JdV, Graesser, Mereghetti'18

- Open-access Python tool almost ready to be submitted (Scholer + Graf + JdV)

NuDoBe

- Open-access Python tool automizes the EFT calculations

[Submitted on 11 Apr 2023]

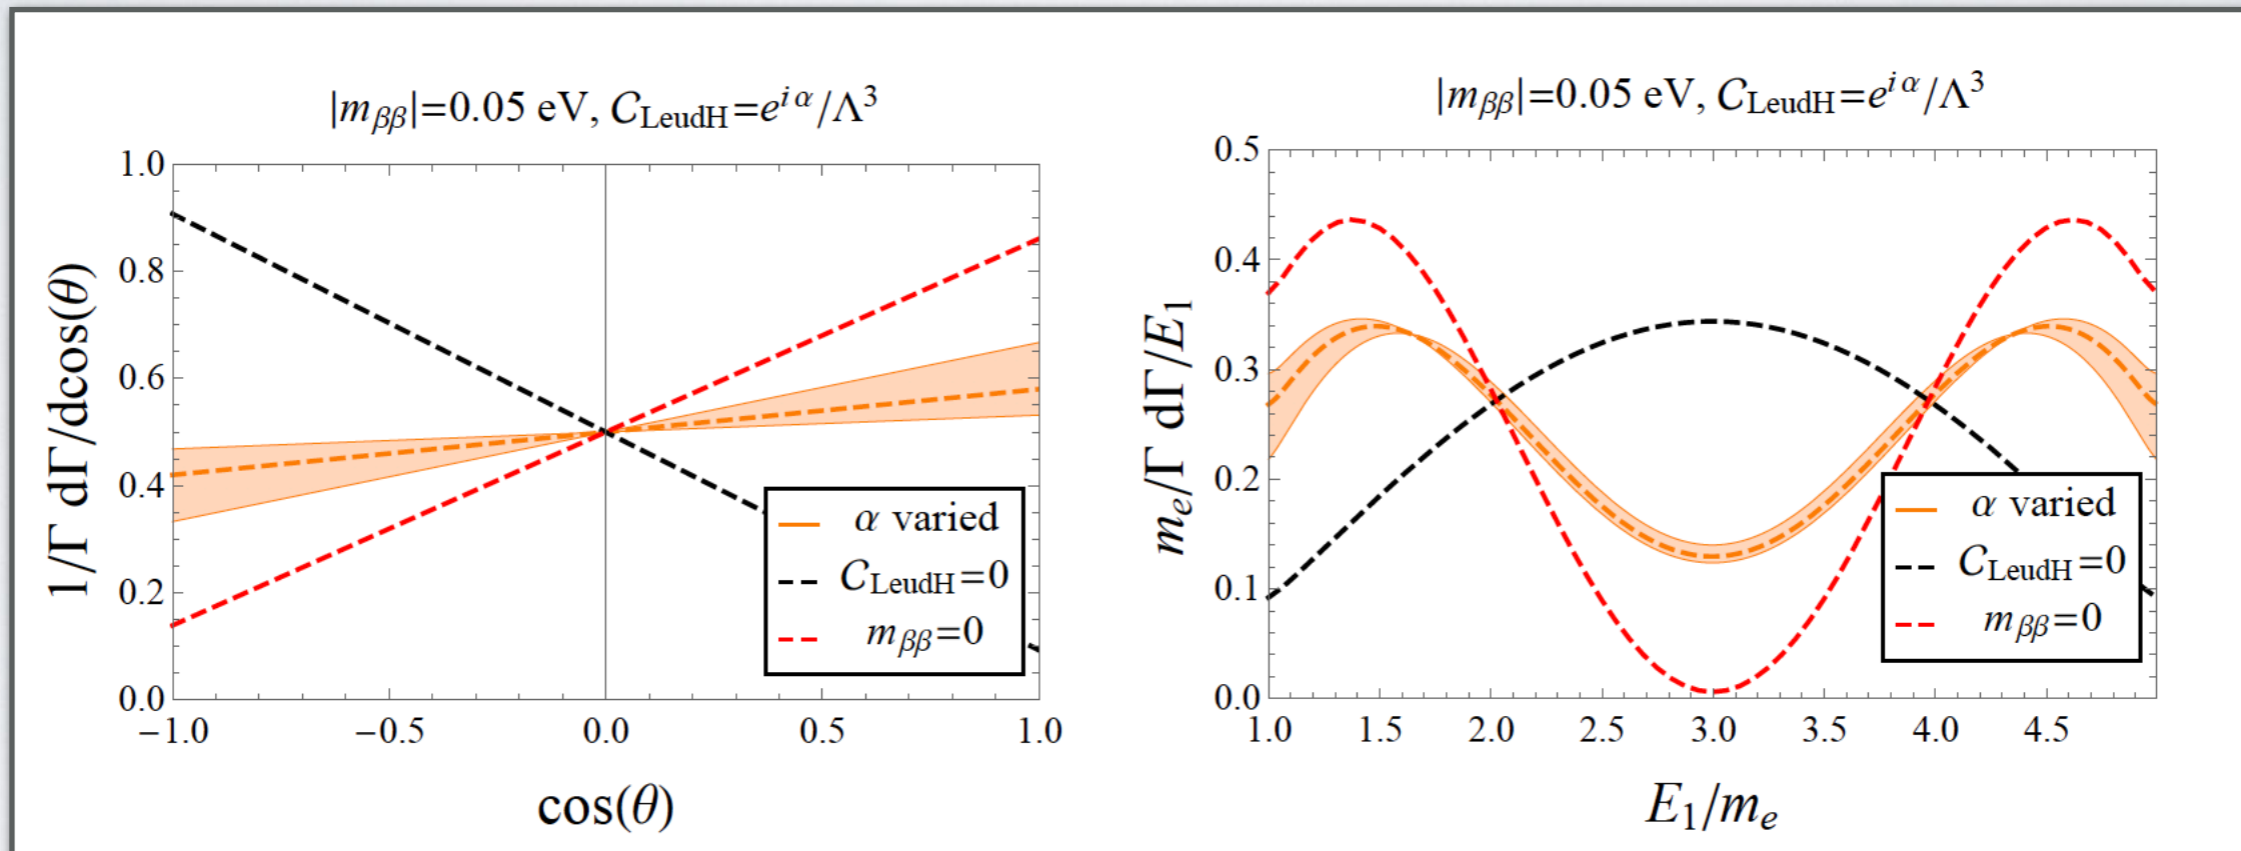

ν DoBe -- A Python Tool for Neutrinoless Double Beta Decay

Oliver Scholer, Jordy de Vries, Lukáš Gráf

- User specifies which SM-EFT LNV operators are turned on at which scale
- Code computes $0\nu\beta\beta$ (differential rates) of all isotopes of interest
- User can vary different results for NMEs/Hadronic LECs etc
- Comes with many built-in plotting options

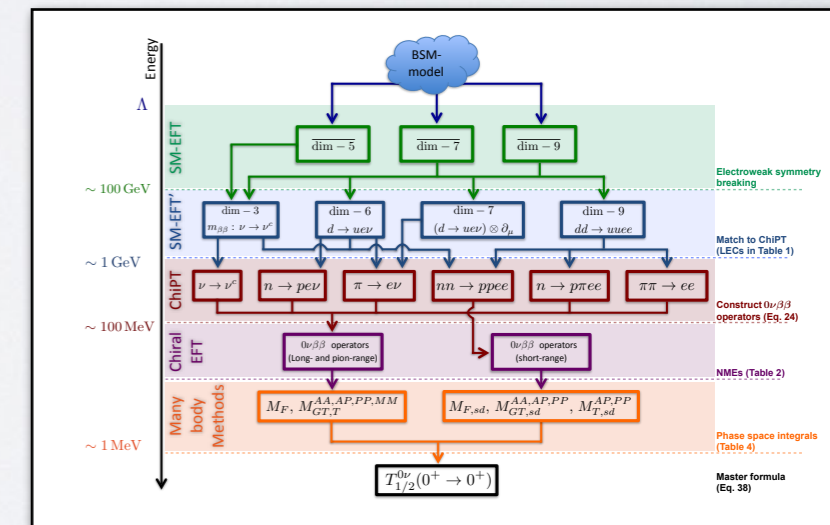

NuDoBe

- Tool also computes angular&energy electron distributions

Concluding remarks

- **Neutrinoless double beta decay best way to determine if neutrinos are Majorana states**
- Heroic experimental effort ! Particle/Hadronic/Nuclear theory needed to interpret data
- Progress from EFT + lattice + nuclear structure
- **New findings:** standard mechanism depends on short-distance physics
Significant impact on NMEs: larger than before.
- End-to-End EFT framework for any LNV source
- Automized with Python Tool: **NuDoBE**
- Not discussed today: light sterile neutrinos and EFT

An analytic approach

- The $nn \rightarrow pp + ee$ amplitude can be represented as an integral expression

$$A_\nu \sim G_F^2 \int \frac{d^4k}{(2\pi)^4} \frac{g_{\mu\nu}}{k^2} \int d^4x e^{ik \cdot x} \langle pp | T\{J_W^\mu(x) J_W^\nu(0)\} | nn \rangle$$

- At small virtual momentum: NLO chiral EFT
- Intermediate momentum: (**model-dependent**) resonance contributions to nucleon form factors and to NN scattering
- Large momentum: Perturbative QCD + Operator Product Expansion

Small dependence on local 4-quark matrix elements

- Analytic and CIB approach within uncertainties (~30-40%)**
- Analytic approach agrees with nucleon-nucleon CIB data

Current procedure in literature

- Compute nuclear matrix element computations for different neutrino masses

$$M(m_4) \sim \frac{1}{\langle p^2 \rangle + m_4^2}$$

$$\langle p^2 \rangle \simeq (100 \text{ MeV})^2$$

$$A_\nu \sim \sum_{i=1}^3 U_{ei}^2 m_i \frac{1}{\langle p^2 \rangle} + U_{e4}^2 m_4 \frac{1}{\langle p^2 \rangle + m_4^2}$$

$m_4 \gg 100 \text{ MeV}$

$$A_\nu \sim \sum_{i=1}^3 U_{ei}^2 m_i \frac{1}{\langle p^2 \rangle} + \frac{U_{e4}^2}{m_4}$$

$m_4 \ll 100 \text{ MeV}$

$$A_\nu \sim \sum_{i=1}^4 U_{ei}^2 m_i \frac{1}{\langle p^2 \rangle}$$

Revisit the light regime

$$A_\nu \sim \sum_{i=1}^3 U_{ei}^2 m_i \frac{1}{\langle p^2 \rangle} + U_{e4}^2 m_4 \frac{1}{\langle p^2 \rangle + m_4^2} \xrightarrow{m_4 \ll 100 \text{ MeV}} A_\nu \sim \sum_{i=1}^4 U_{ei}^2 m_i \frac{1}{\langle p^2 \rangle} + \mathcal{O}\left(\frac{m_i^3}{\langle p^2 \rangle^2}\right)$$

- The first term depends on $\sum_{i=1}^4 U_{ei}^2 m_i = M_{ee} = 0$ $M = \begin{pmatrix} 0 & \nu y_\nu \\ \nu y_\nu & M_R \end{pmatrix}$

- The 'GIM' mechanism for neutrinos !** (only valid if all steriles are light)

- The amplitude is strongly suppressed $A_\nu \sim \sum_{i=1}^4 U_{ei}^2 m_i^3$ Blennow et al '10 JHEP

- Example in 3+1 model

- Cancellation between light + sterile contributions leads to

$$\tau_{1/2} \sim m_4^4$$

Light extra neutrinos

- Is there a way to avoid the GIM mechanism ?
- There are additional contributions from 'ultra-soft' neutrinos

$$\sum_n \langle f | J_\mu | n \rangle \langle f | J^\mu | i \rangle \times \int \frac{d^3k}{(2\pi)^3} \frac{1}{E_\nu [E_\nu + (E_n - E_0) - i\epsilon]} \quad E_\nu = \sqrt{k^2 + m_i^2}$$

- Depends on nuclear excited states. Normally these are tiny effects (5%)
- But become dominant in the GIM mechanism ! $\sim U_{ei}^2 m_i^3$
- For $m_i \sim \text{MeV}$ we get new contributions $\sim U_{ei}^2 m_i^2$
- For $m_i \ll \text{MeV}$ we get new contributions $\sim U_{ei}^2 m_i^3 \log \frac{(E_n - E_0)^2}{m_i^2}$
- These effects are not considered in any analysis of neutrinoless double beta decay
- Javier Menendez computed for us the necessary matrix elements

Light extra neutrinos

- Is there a way to avoid the GIM mechanism ?
- There are additional contributions from 'ultra-soft' neutrinos

$$\sum_n \langle f | J_\mu | n \rangle \langle f | J^\mu | i \rangle \times \int \frac{d^3k}{(2\pi)^3} \frac{1}{E_\nu [E_\nu + (E_n - E_0) - i\epsilon]} \quad E_\nu = \sqrt{k^2 + m_i^2}$$

100x larger decay rates
Still small ;)

- These effects are not considered in any analysis of neutrinoless double beta decay
- **Work in progress: compute these corrections for realistic models**
- Other issues (not today) $g_\nu^{NN}(m_i)$? NME's don't make sense for $m_i \gg \text{GeV} \dots$
