# Outline

- ① B tag shape SF
- ② Validation of b tag shape correction
- ③ Signal region

# Update

- Object removal switched to tight leptons and taus
- HLT SF added
- B tag R remeasured for 2016

# 1tau1l control region definition

# SF and corrections

- Corrections we have considered
  - Prefiring
  - Pileup
  - **HLT SF** : measured for 2016
  - Tau: both TES and ID SF
  - Jet: JES
  - Lepton efficiency SF
  - B jet: b tag shape correction (2016)
- Have not considered
  - JER

Section 1

## **B tag shape SF**

# B tag uncertainty(shape)

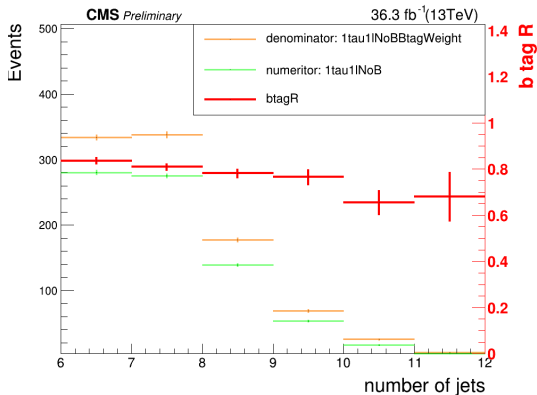

- Need to correct for both shape and yield
  - For both 1tau0l and 1tau1l, we are using the shape of the b tag score
  - $\geq 2$  b jets (medium working points) for SR (both 1tau0l and 1tau1l)
- BTV 1d) Event reweighting using discriminator-dependent scale factors from BTV
  - <https://twiki.cern.ch/twiki/bin/viewauth/CMS/BTagShapeCalibration>
  - $w_{event} = \prod_i^{N_{jets}} SF(D_i, p_{t_i}, \eta_i, flavor_i)$ 
    - $D_i$ : b tag discriminant
    - The difference between working points weight is that SF here is more bins with regard to  $D_i$
  - Effect on event yields
    - the number of events (i.e. the sum of event weights) before and after applying b-tag weights should be identical
    - Measure the sum of event weights before and after applying b-tag event weights, without requiring any b-tag selection in both cases
    - $r = \sum w_{before} / \sum w_{after}$  represents a phase space extrapolation and should be multiplied to the b-tag event weight
    - this extrapolation could in general depend on further variables, most notably the jet multiplicity. Especially in analyses with a large number of jets (e.g.  $t\bar{t}$  or  $t\bar{t}H$ ) one should consider to measure and apply the ratio  $r$  per jet multiplicity bin
    - Measure  $R$  in region without b jet requirement

# B tag R

- Measurement region
  - tau number=1; lepton =1; jet  $\geq 6$ ; (and baseline without b jet requirement: jet  $\geq 6$ ; HT>500; 6jet\_pt $\geq 40$ )
- Should we use all background for R calculation or just tt?
  - Just tt
  - MC correction:  $\text{EVENT\_prefireWeight} * (*\text{PUweight\_}) * (*\text{HLT\_weight}) * (*\text{tauT\_IDSF\_weight\_new}) * (*\text{elesTopMVAT\_weight}) * (*\text{musTopMVAT\_weight})$  (TES no JER)
- Include b tag shape correction when measuring HLT SF in b jet multiplicity, this means the normalization factor R is taken into account in function of b jet multiplicity

# B tag R vs jet multiplicity

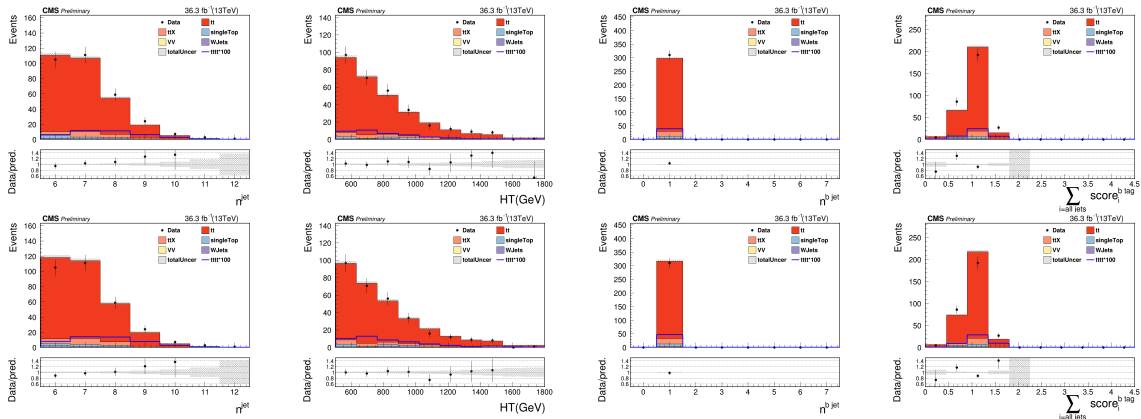

Section 2

## **Validation of b tag shape correction**

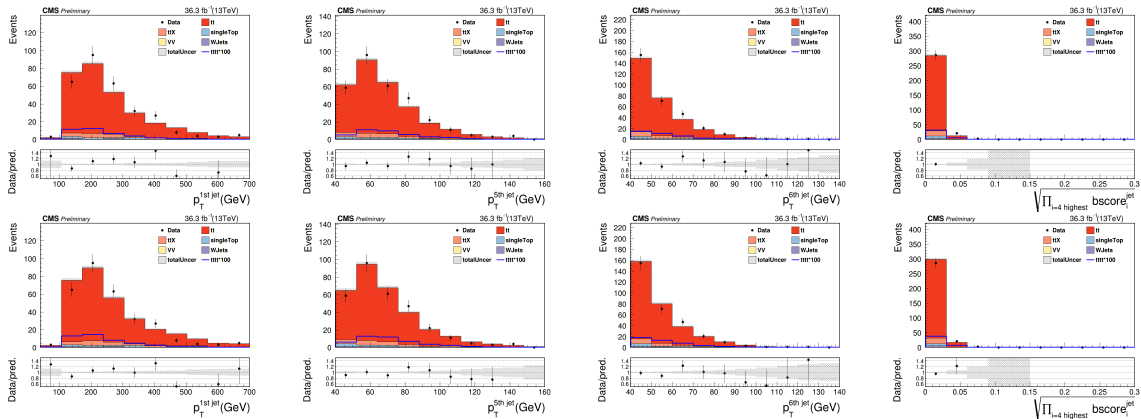

# B tag efficiency correction before and after(CR1)

- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \* JES(no JER)
- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \* **b tag shape correction** \* JES(no JER)

# B tag efficiency correction before and after(CR1)

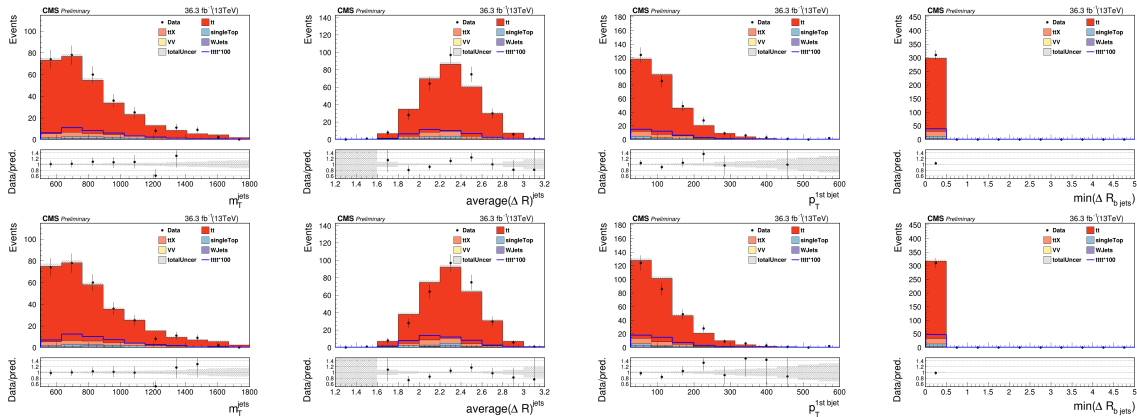

- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \* JES(no JER)
- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \* **b tag shape correction** \* JES(no JER)

# B tag efficiency correction before and after(CR1)

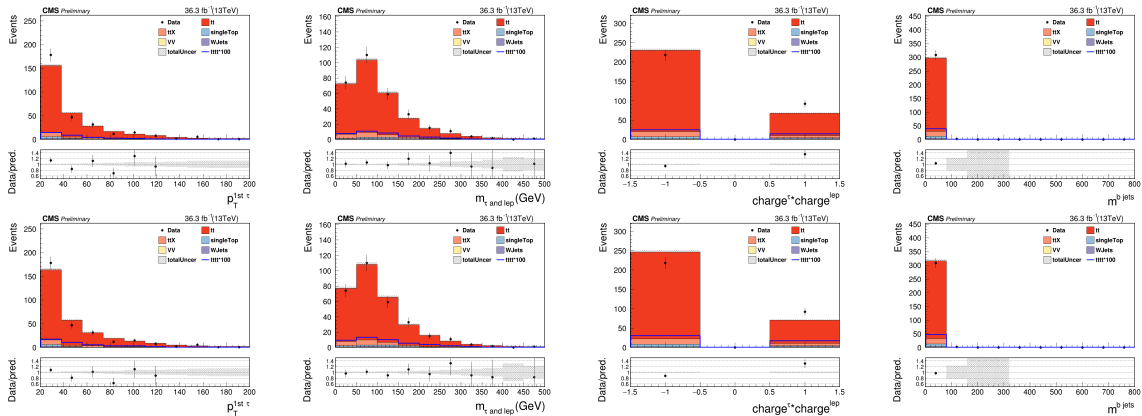

- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \* JES(no JER)
- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \* **b tag shape correction** \* JES(no JER)

# B tag efficiency correction before and after(CR1)

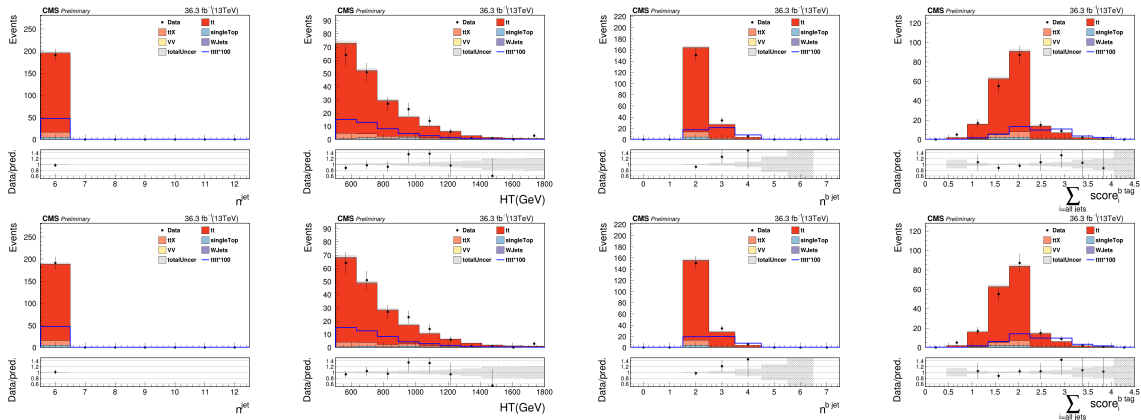

- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \* JES(no JER)
- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \* **b tag shape correction** \* JES(no JER)

# B tag efficiency correction before and after(CR1)

- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \* JES(no JER)
- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \* **b tag shape correction** \* JES(no JER)

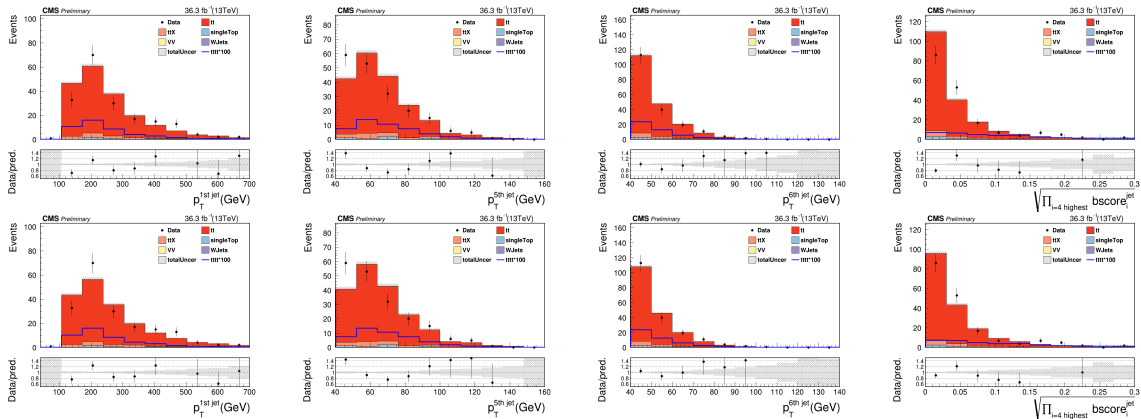

# B tag efficiency correction before and after(CR2)

- MC correction:  $\text{prefireWeight} * \text{pileup reweighting} * \text{HLT SF} * \text{tau efficiency SF and energy scale} * \text{lepton efficiency SF} * \text{JES(no JER)}$
- MC correction:  $\text{prefireWeight} * \text{pileup reweighting} * \text{HLT SF} * \text{tau efficiency SF and energy scale} * \text{lepton efficiency SF} * \text{b tag shape correction} * \text{JES(no JER)}$

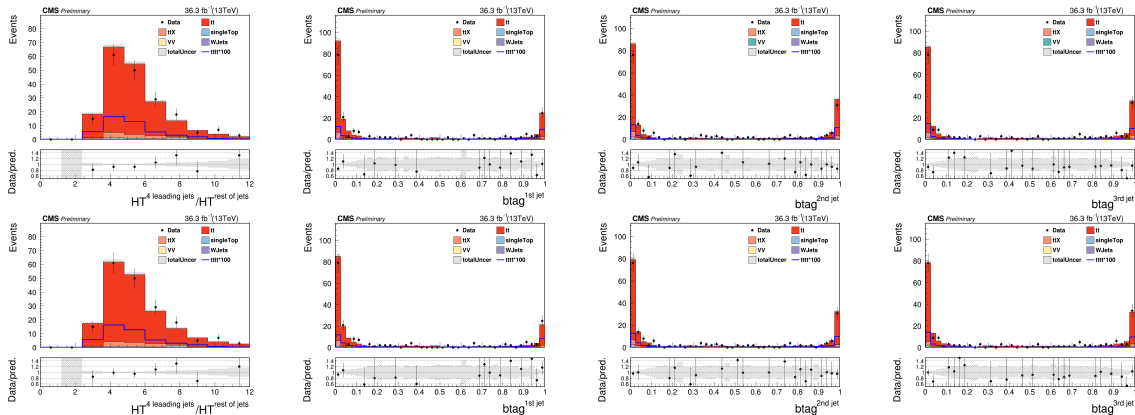

# B tag efficiency correction before and after(CR2)

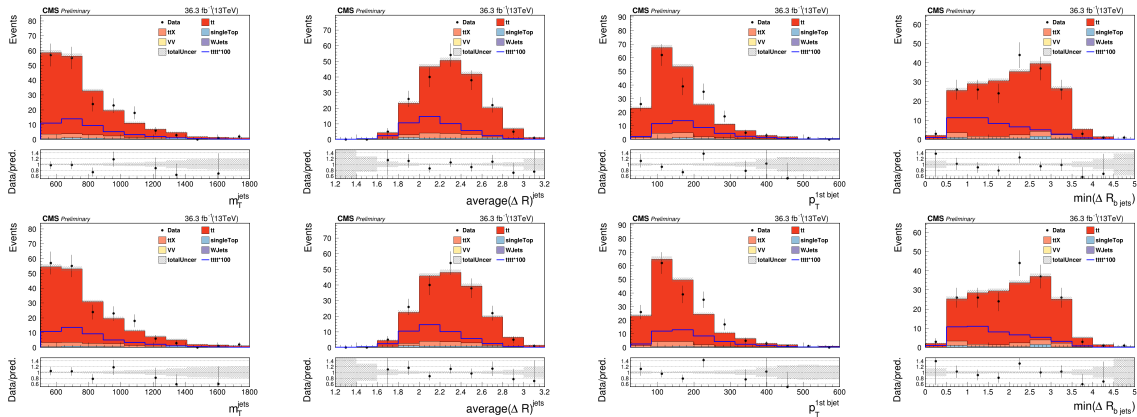

- MC correction:  $prefireWeight * pileup\ reweighting * HLT\ SF * \tau\ efficiency\ SF\ and\ energy\ scale * lepton\ efficiency\ SF * JES(no\ JER)$
- MC correction:  $prefireWeight * pileup\ reweighting * HLT\ SF * \tau\ efficiency\ SF\ and\ energy\ scale * lepton\ efficiency\ SF * b\ tag\ shape\ correction * JES(no\ JER)$

# B tag efficiency correction before and after(CR2)

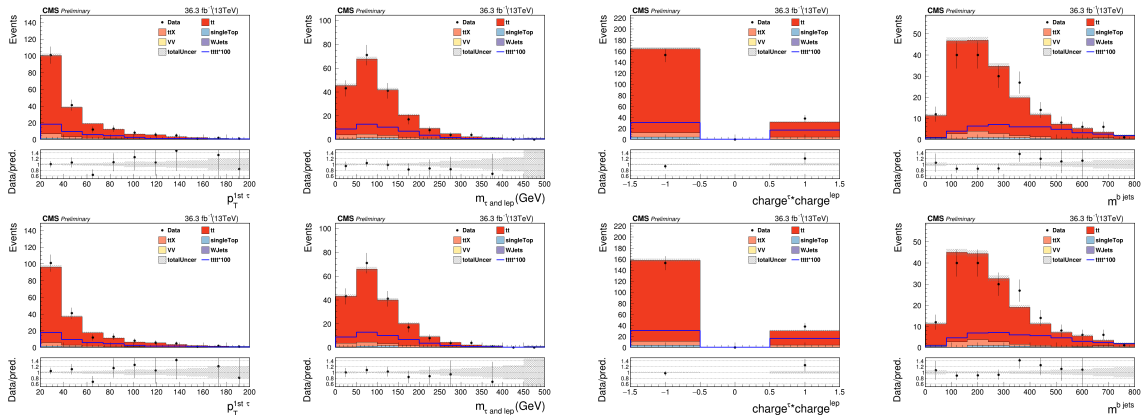

- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \* JES(no JER)
- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \* **b tag shape correction** \* JES(no JER)

# B tag efficiency correction before and after(CR2)

- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \* JES(no JER)
- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \* **b tag shape correction** \* JES(no JER)

# B tag efficiency correction before and after(CR2)

- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \* JES(no JER)
- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \* **b tag shape correction** \* JES(no JER)

Section 3

## **Signal region**

# 1tau1l SR

- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \* b tag shape correction \* JES(no JER)

# 1tau1l SR

- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \*
- \* b tag shape correction \* JES(no JER)

# 1tau1l SR

- MC correction: prefireWeight \* pileup reweighting \* HLT SF \* tau efficiency SF and energy scale \* lepton efficiency SF \* b tag shape correction \* JES(no JER)

Section 4

- 1tau1lNoB: b tag R measurement region

## B tag efficiency SF(yield)

- $SF = \frac{\epsilon_{data}}{\epsilon_{MC}}$
- Only using working points
  - $P(MC) = \prod_{i=tagged} \epsilon_i \prod_{j=nottagged} \epsilon_j$  ?
  - $P(Data) = \prod_{i=tagged} SF_i \epsilon_i \prod_{j=nottagged} SF_j \epsilon_j$  ?
  - $w = \frac{P_{data}}{P_{MC}}$
- If we ask 2 b tagged jets
  - the probability for jets to have such configuration is as above
- <https://twiki.cern.ch/twiki/bin/viewauth/CMS/BTagSFMethods>
- $\epsilon = \frac{N_{btagged}}{N_{total}}$

# Questions

- How is our btag sf different than object SF?
  - object efficiency SF
    - electron efficiency means the probability of **true electron?** passing selection criteria
    - the efficiency means passing or not efficiency. Correct for event yield, after the electron selection
    - Does the event weight impact the shape of other variables?
    - efficiency means the probability of **true** lepton passing selection, how about non-true object passing selection criteria?
  - For electron and muon, the efficiency is high and close to 1, the 1-efficiency is close to 0 so we don't need to consider the arrangement of true leptons not passing but non-true passing
- How to consider the uncertainty of measured R?
