

# TriggerID Alignment

Siyuan SONG, Francois Lagarde

# Content

- A. Brief Introduction.**
- B. Preliminary findings.**
- C. Strange patterns we  
notice in ECAL TriggerID.**

# Motivation

- 1. Find TriggerID mis-match patterns.**
- 2. Provide debug hints for electronics part colleagues.**
- 3. Align the collected data (Bonus).**

# Strategy

- 1. Find muon-like tracks both in  $e^+$ ,  $\pi^+$  Run files of ECAL and AHCAL.**
- 2. Collect related TriggerIDs separately.**
- 3. Discover shift patterns in these TriggerIDs.**

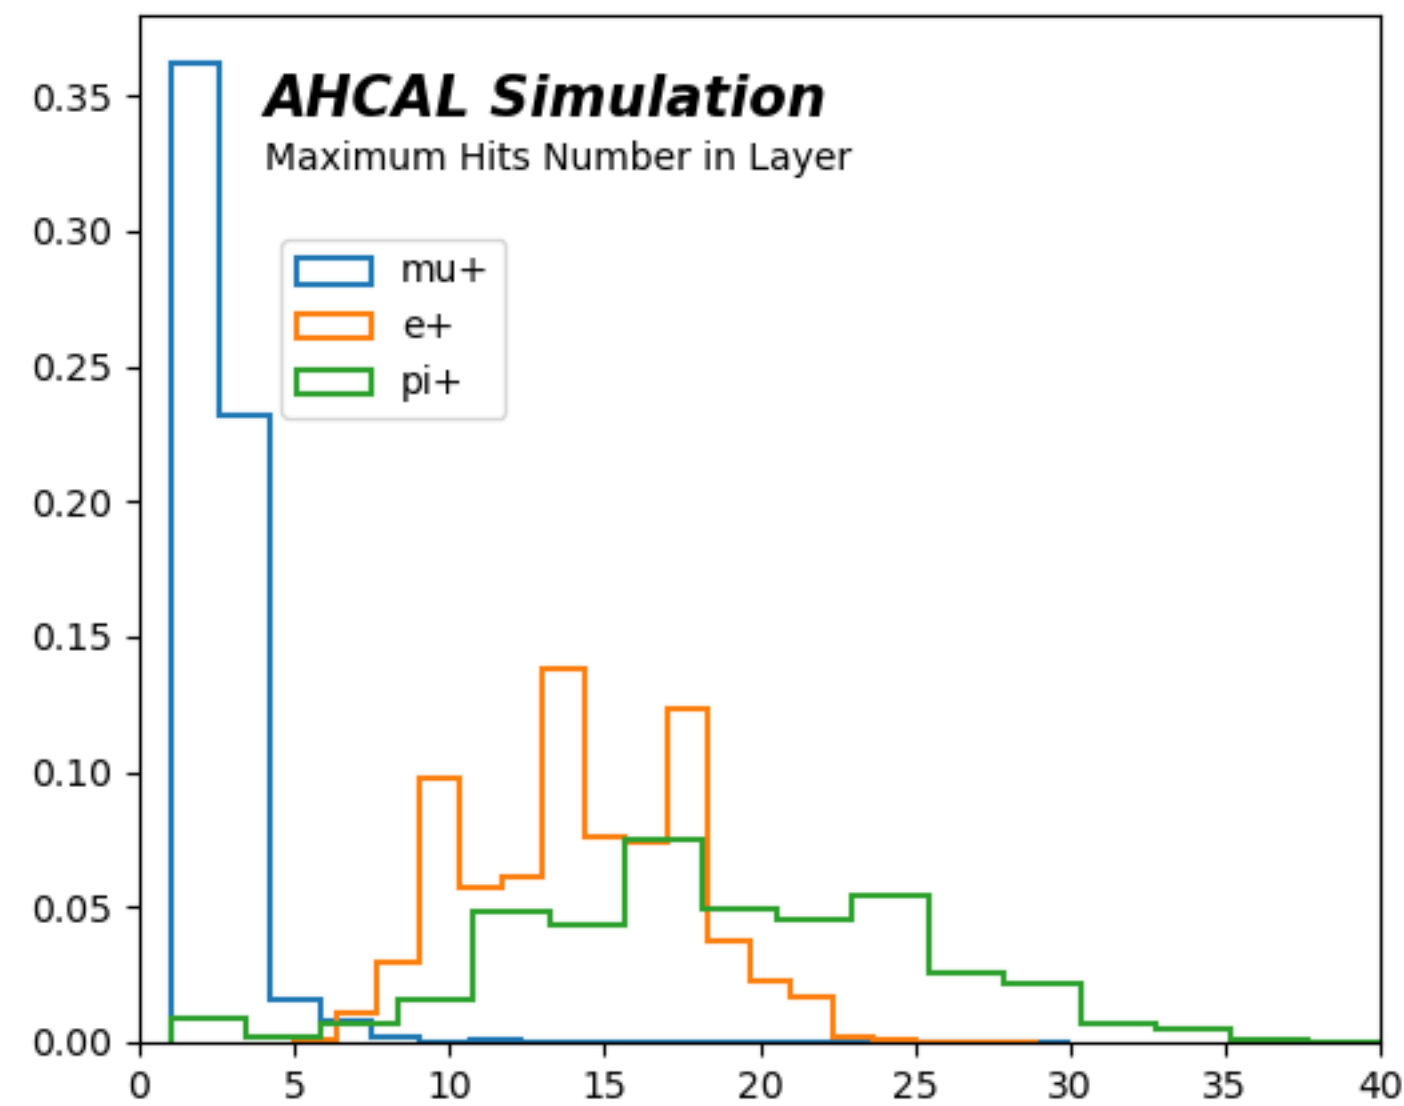

# Find Muon-like Tracks

- A. In the first stage, we would bypass Fancy PID (Quick Selection).**
- B. Three criteria:**
  - 1. Not Shower: fired cells  $< 5$  (tunable) in each layer.**
  - 2. ( Fired cells / Fired Layers )  $< 1.2$  (tunable)**
  - 3. Fired layers  $> 0.8$  (tunable) \* total layers. (ECAL 32, AHCAL 40) .**

```
if notshower and (cells_fired / layers_fired < 1.2) and (layers_fired > (0.8 * layer_num)):  
    trigger_ID_picked.append(trigger_ID[i])
```

# SJTU AHCAL Simulation

● Include -  $\mu^+$ : 160 GeV,  $e^+$ ,  $\pi^+$ : 20-120 GeV

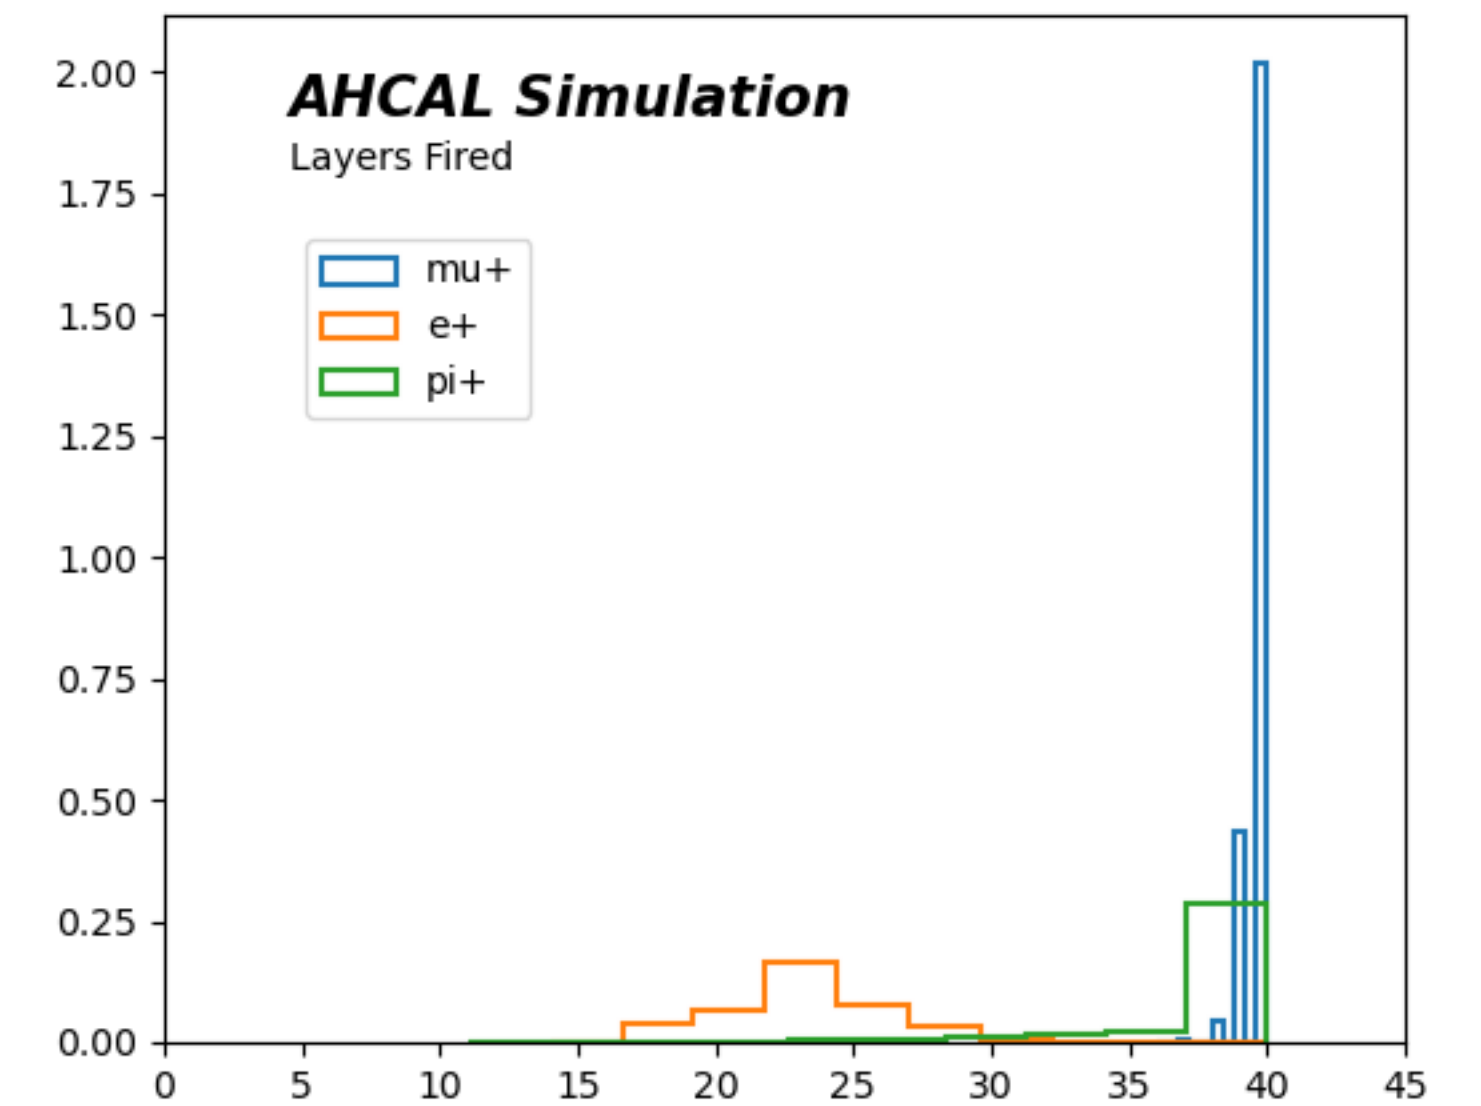

↑  
**Cut: # < 5**

**Not shower**

↑  
**Cut: # < 1.2**

**Cells fired number / Layers fired number**

↑  
**Cut: # > 80%**

**Layers fired**

# Algorithm

- ◆ We collected ECAL and AHCAL TriggerIDs representing muon-like track separately.
- ◆ We calculated all the combinations of the TriggerID shift:
  - ◆  $ECAL_{TriggerID} - AHCAL_{TriggerID}$
- ◆ If there is a shift value appearing most, a constant shift dominates.

# Run files checked in this talk

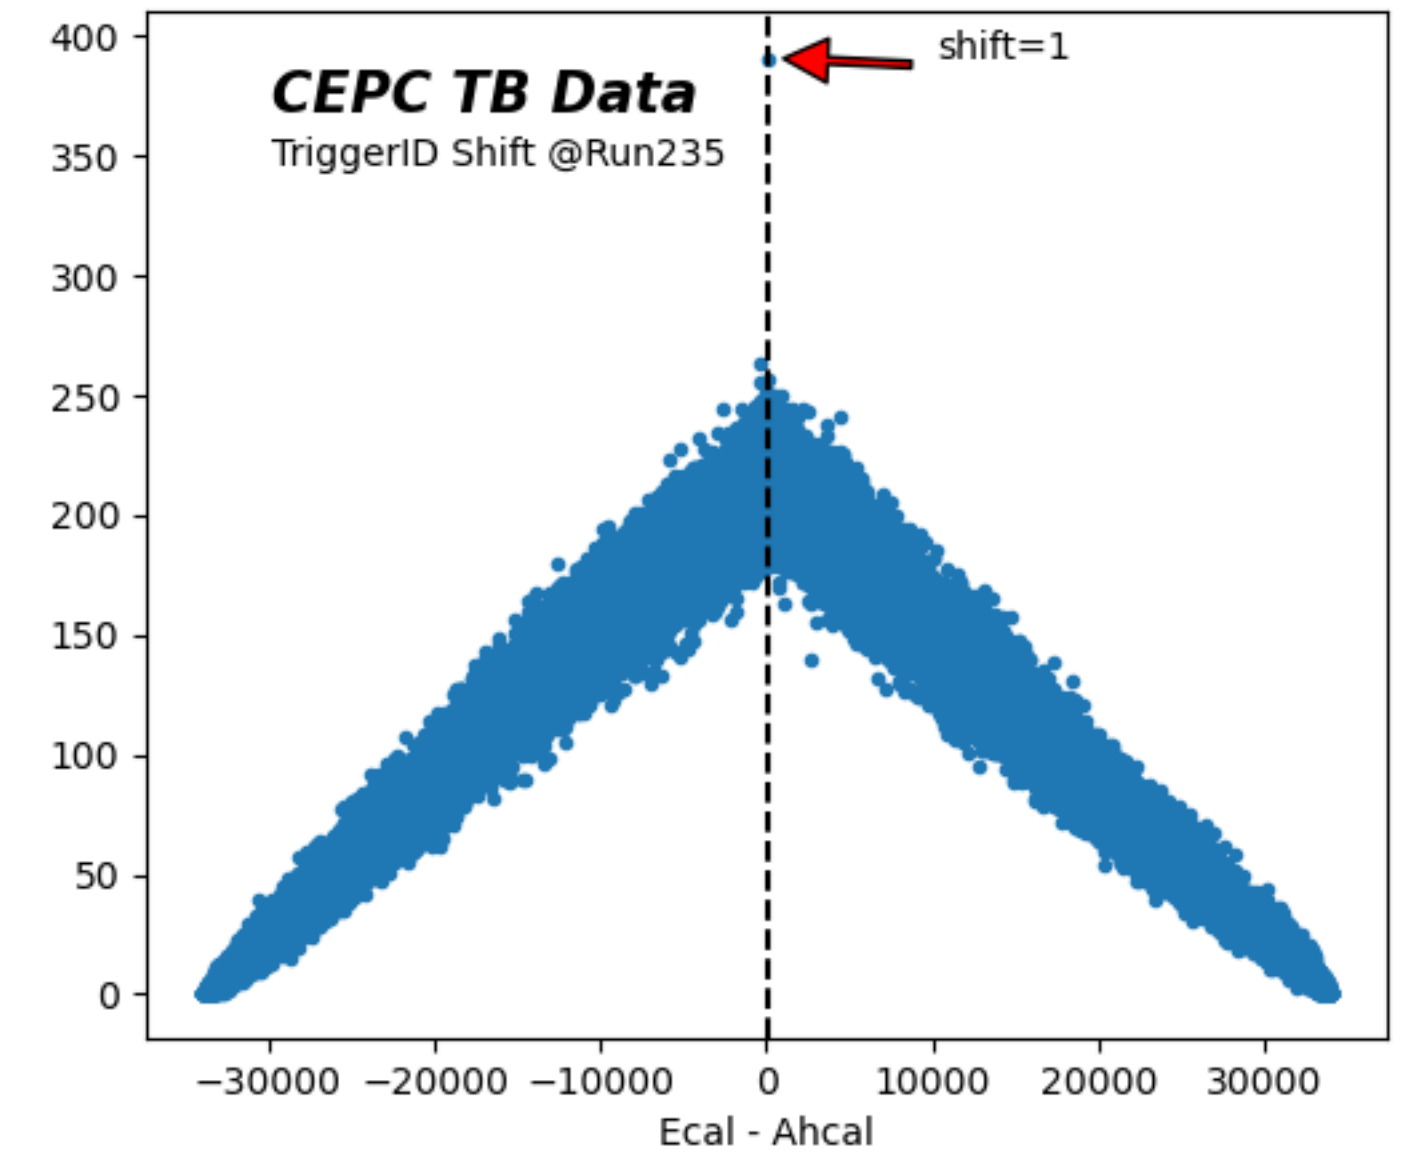

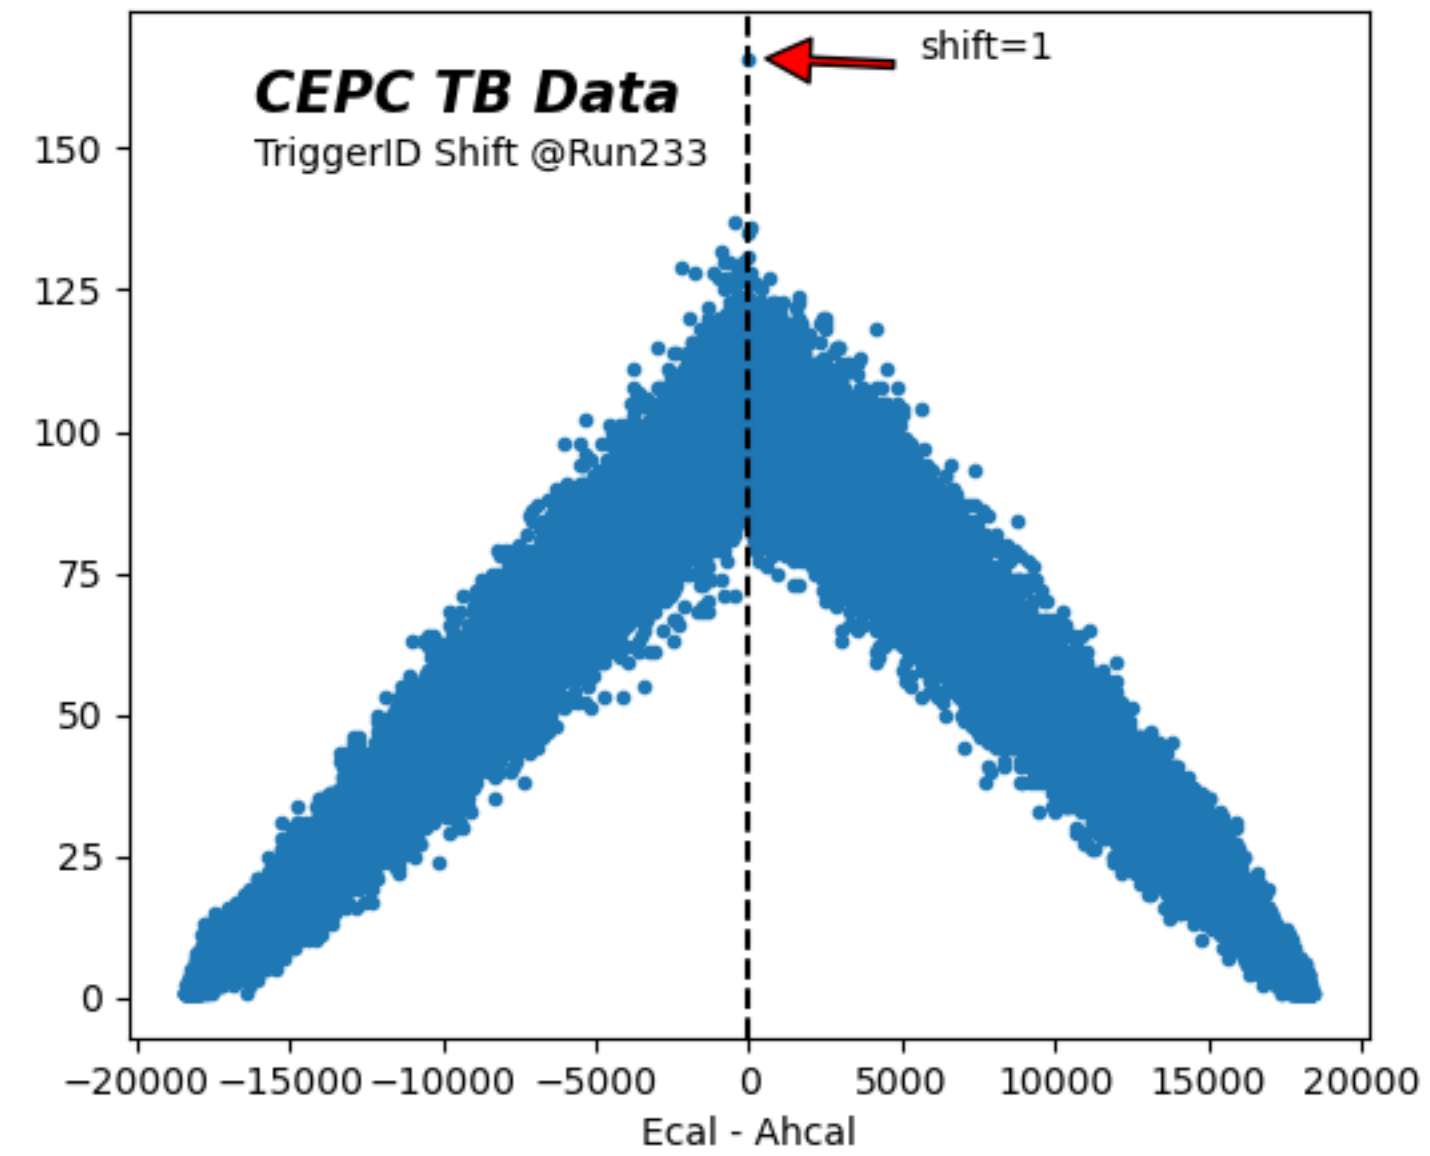

Run #	Type
Run 225	e+ 20GeV
Run 233	e+ 40GeV
Run 235	e+ 40GeV
Run 250	e+ 50GeV
Run 258	pi+ 30GeV
Run 265	pi+ 50GeV
Run 280	Pi+ 100GeV
Run 290	e+ 100GeV

**ECAL:** /cefs/higgs/wangjx/ScECAL/Result\_Diagnose/decode

**AHCAL:** /cefs/higgs/shiyk/Beam\_2022/DataBase/Calib/Particle

**Results for all Run files checked:** /cefs/higgs/siyuansong/Syn/Fig

# Preliminary Findings

**Shift = 1 dominates.**

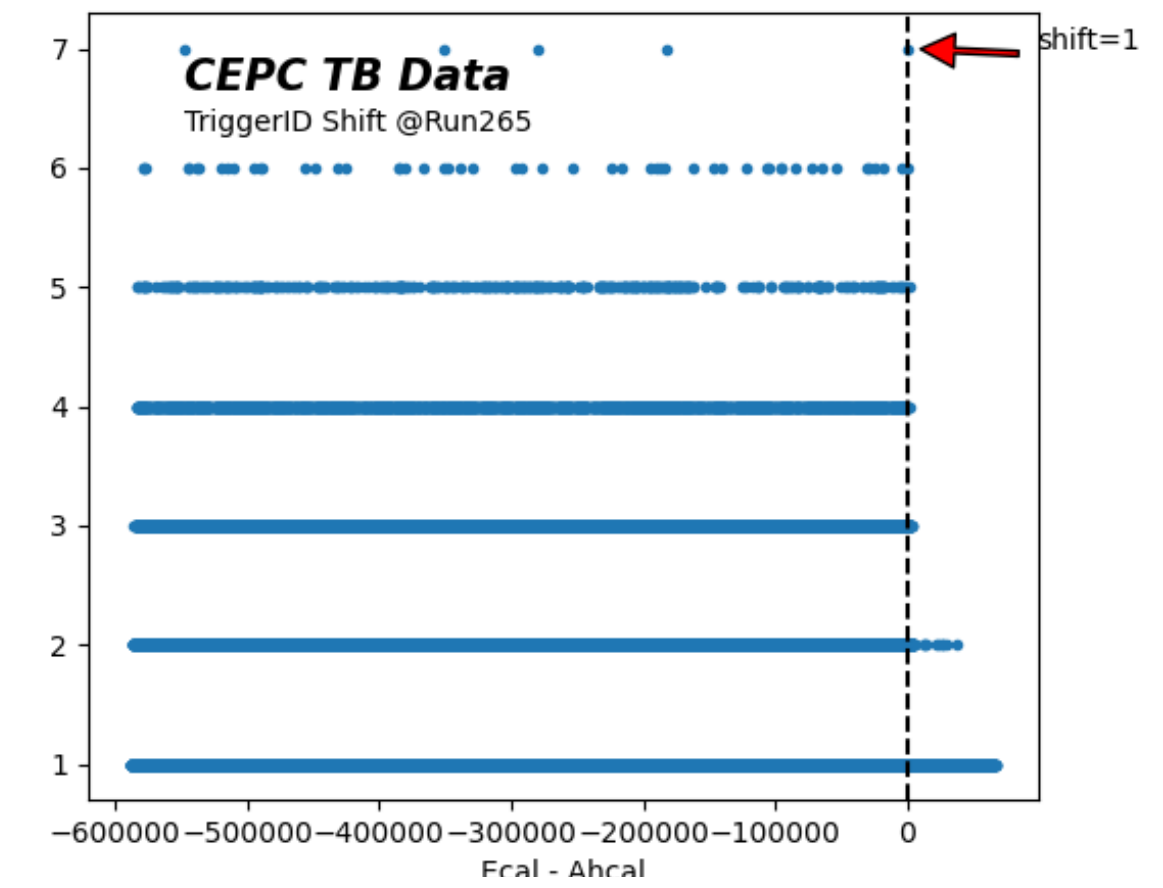

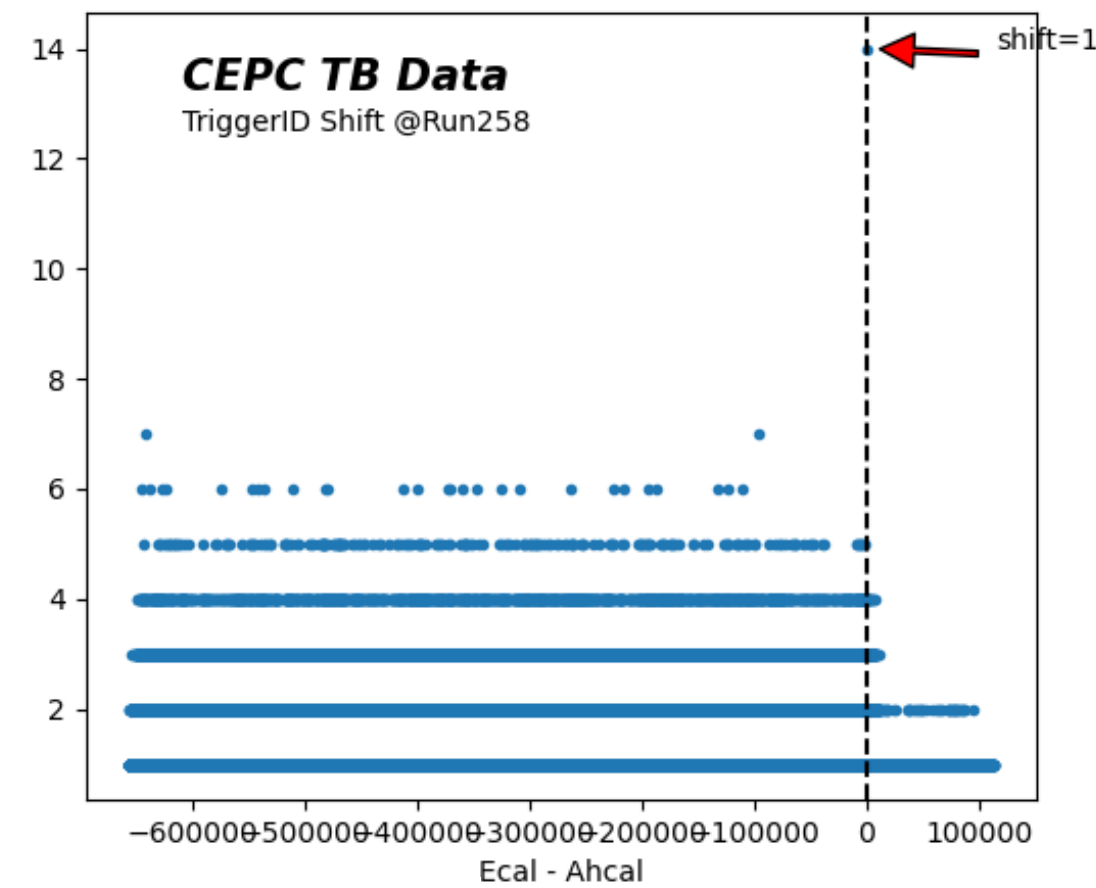

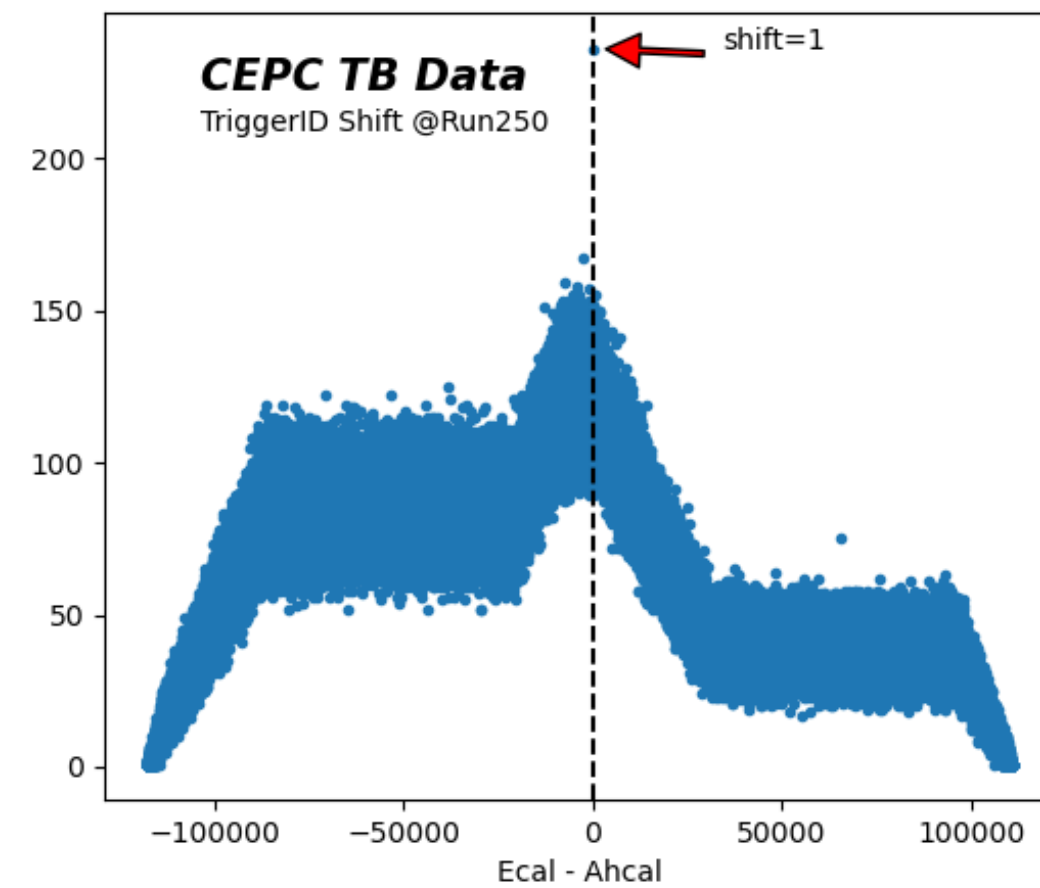

# Preliminary Findings

Check shift from -100 to 100, calculate coincidence number.

**Shift = 1 dominates.**

# Preliminary Findings

Reasoning in the next page.  
Although Shift = 1 dominates, shapes seem strange.

# Reasoning

$ECAL_{TriggerID}$  Picked Number  $\ll$   $AHCAL_{TriggerID}$  Picked Number

1	ECAL: 467
2	<u>AHCAL: 20233</u>

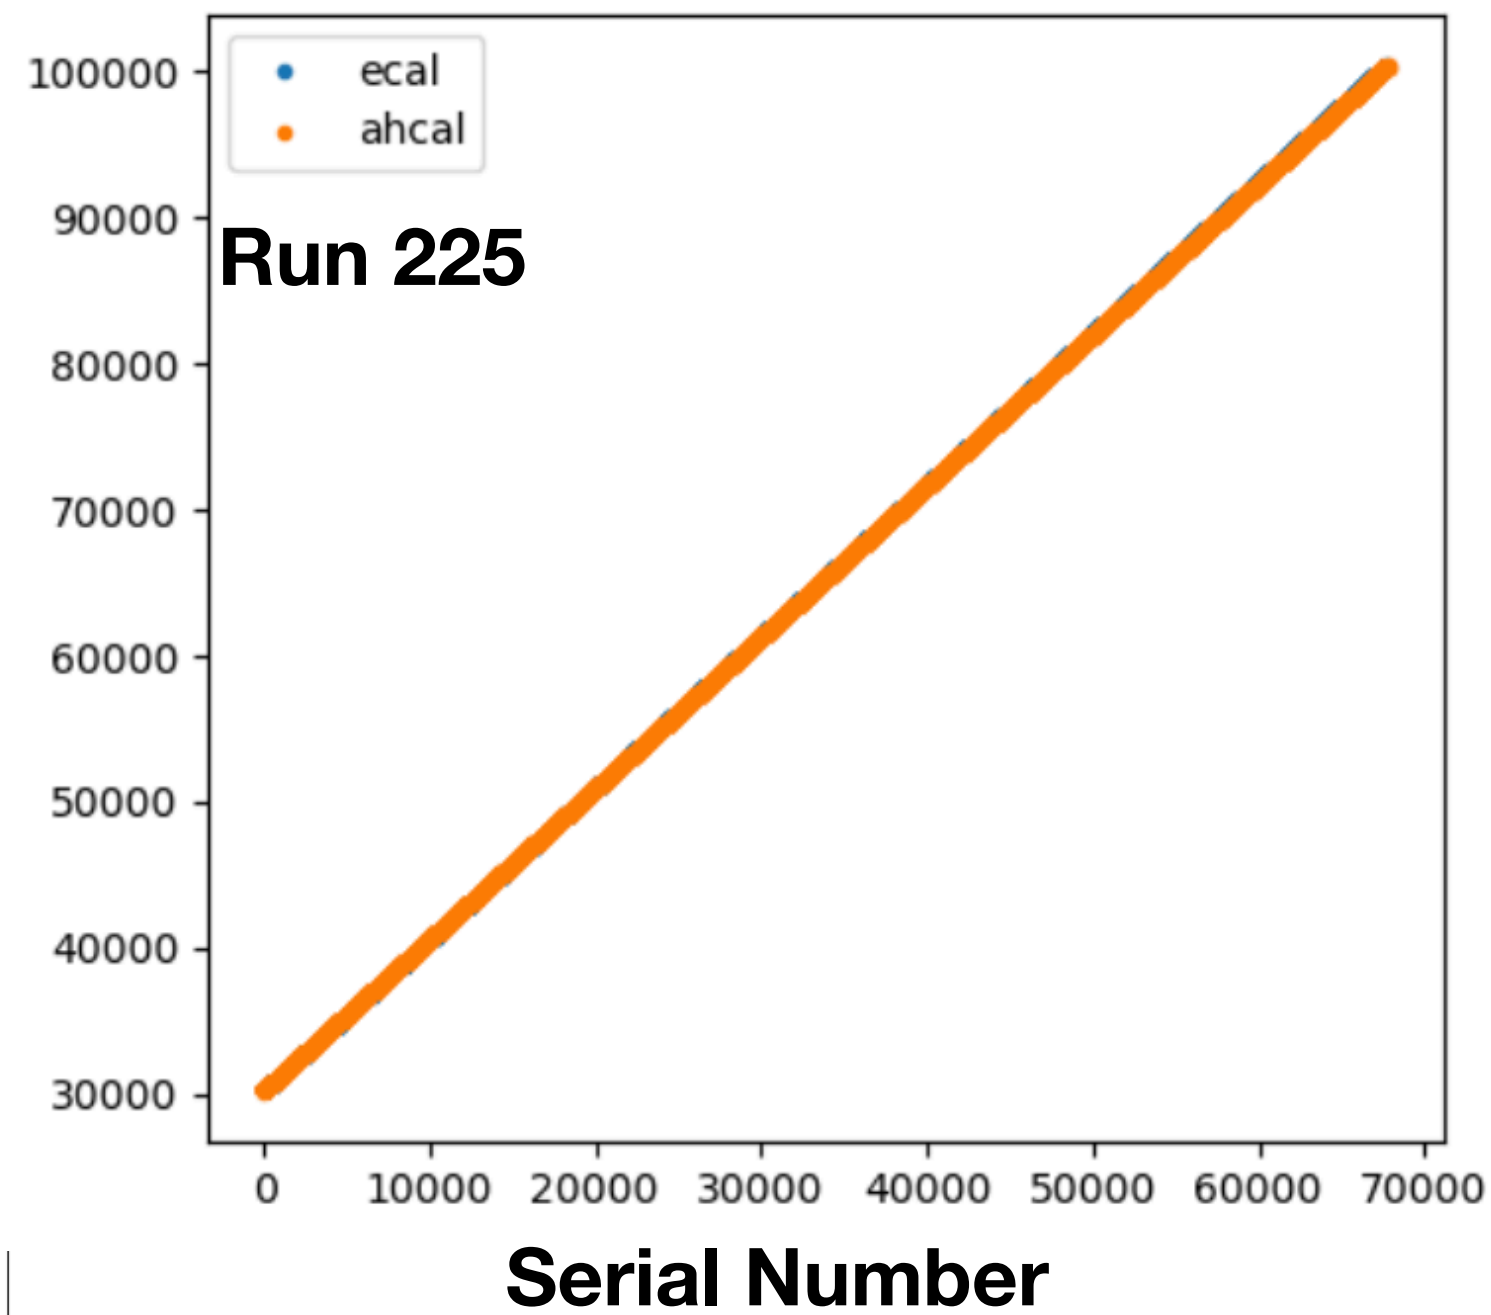

I dropped ECAL TriggerIDs much larger than AHCAL TriggerIDs

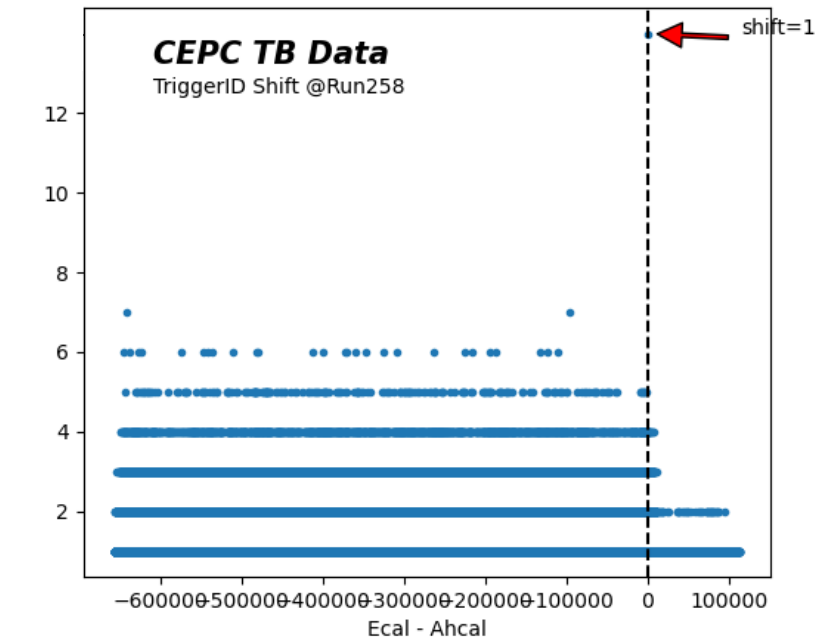

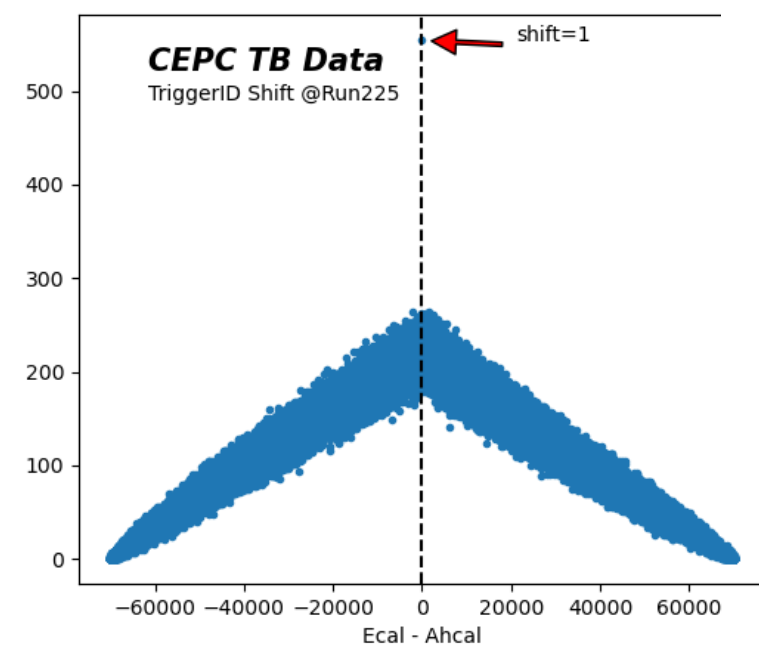

ECAL TriggerIDs sometimes become extremely large

# Abnormal ECAL TriggerID

TriggerID

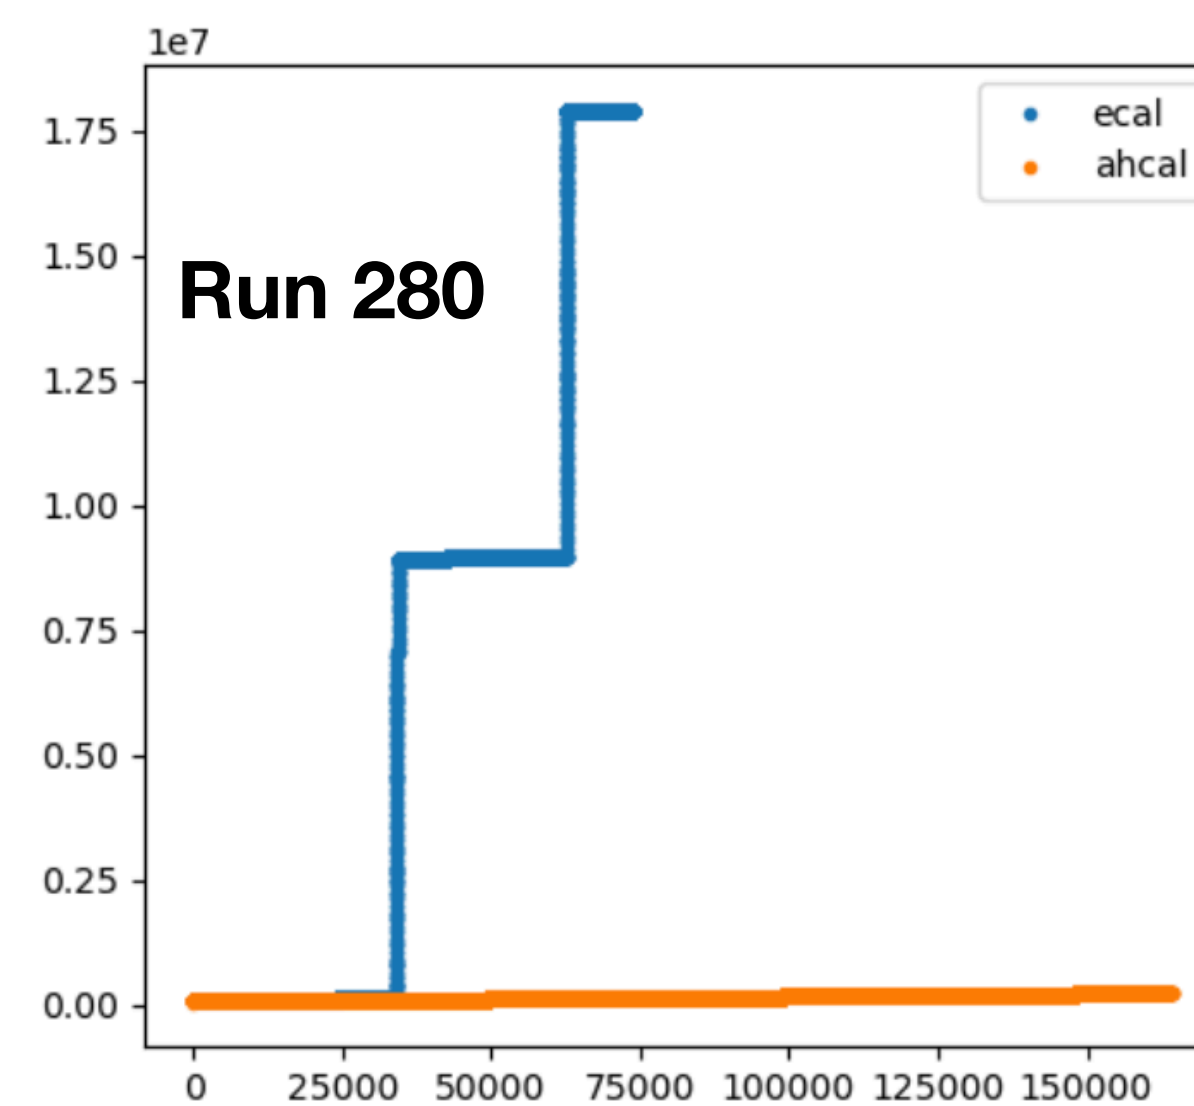

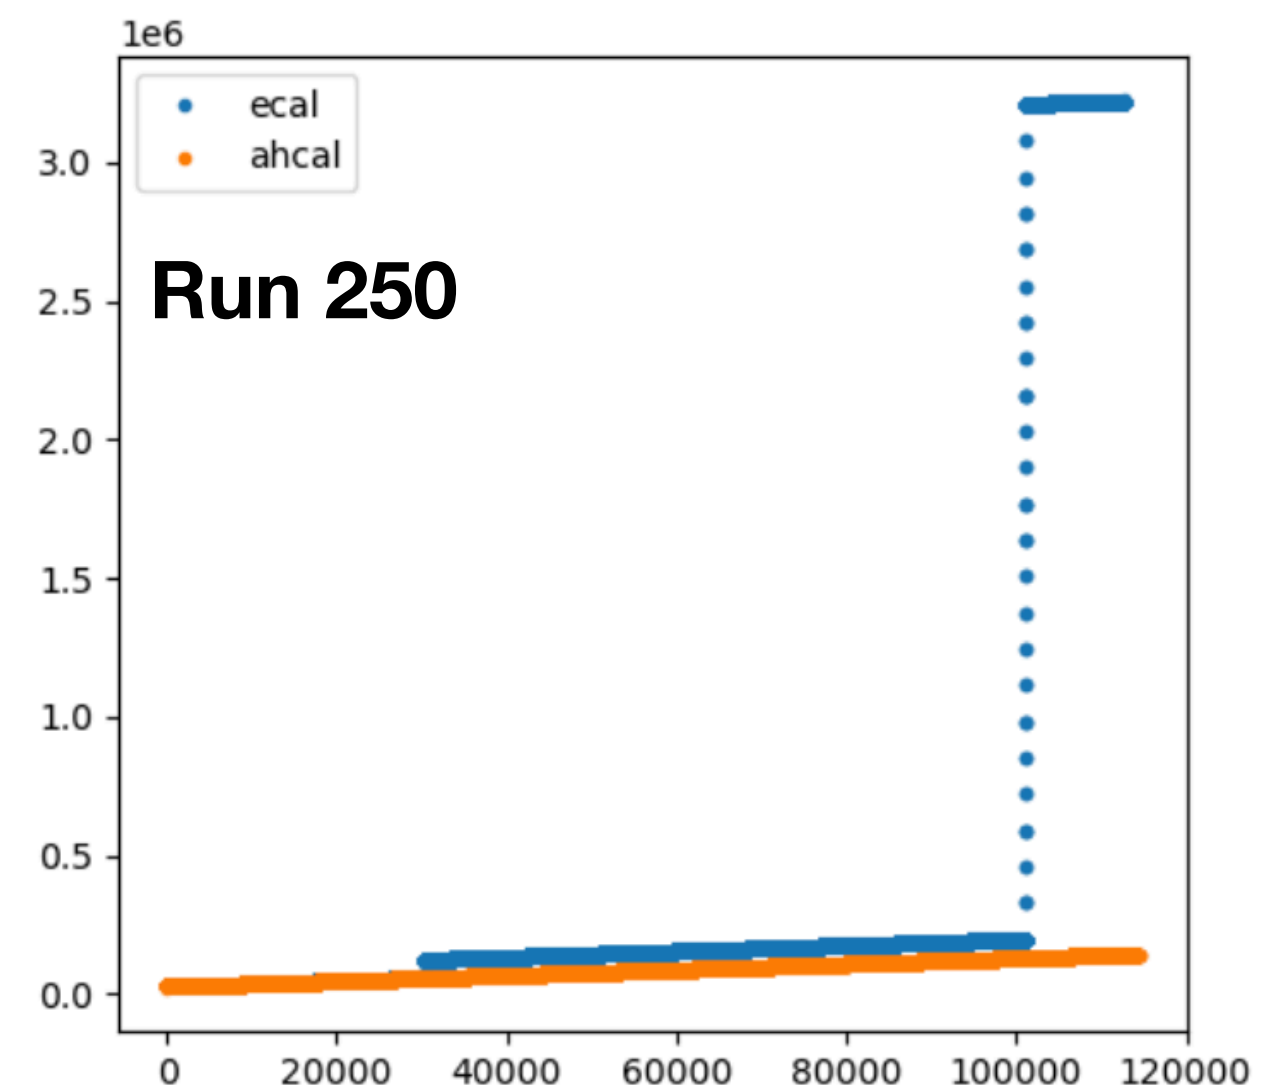

TriggerID

ECAL TriggerIDs in Run 225 look acceptable, but in Run 265, they increase quickly.

# Abnormal ECAL TriggerID

# Conclusion

**A.Shift=1 dominates in all files I randomly selected, consistent with findings using EventDisplay in December.**

**B.ECAL TriggerIDs are abnormal in many Run files.**

**C.I understand algorithm when decoding .dat files leads to these extremely large ECAL TriggerIDs, so errors root in .dat files, and this might cause TriggerID mis-match.**

**D.Electronics part colleagues would help a lot if they take these hints and check .dat files and TLU codes.**

# SJTU AHCAL Simulation

Particle\E (GeV)	20	30	40	50	60	70	80	90	100	120	160	Total	Finished
