# The lattice design of SppC collider ring 

Haocheng Xu, Yiwei Wang, Jie Gao, Yukai Chen, Jingyu Tang for the SppC Study Group

The Institute of High Energy Physics, Chinese Academy of Sciences

2023 International Workshop on the High Energy Circular Electron Positron Collider 27 Oct. 2023, Nanjing

## Content

- SppC lattice design and nonlinearity optimization
- Error correction scheme
- Geometric compatibility between CEPC and SppC

| Parameter | Value | Unit |
| :---: | :---: | :---: |
| General design parameters |  |  |
| Circumference | 100 | km |
| Beam energy | 62.5 | TeV |
| Lorentz gamma | 66631 |  |
| Dipole field | 20 | T |
| Dipole curvature radius | 10415.4 | m |
| Arc filling factor | 0.78 |  |
| Total dipole magnet length | 65.442 | km |
| Arc length | 83.9 | km |
| Number of long straight sections | 8 |  |
| Total straight section length | 16.1 | km |
| Energy gain factor in collider rings | 19.53 |  |
| Injection energy | 3.2 | TeV |
| Number of IPs | 2 |  |
| Revolution frequency | 3.00 | kHz |
| Physics performance and beam parameters |  |  |
| Initial luminosity per IP | $4.3^{\prime} 10^{34}$ | $\mathrm{cm}^{-2} \mathrm{~s}^{-1}$ |
| Beta function at collision | 0.50 | m |
| Circulating beam current | 0.19 | A |
| Nominal beam-beam tune shift limit per IP | 0.015 |  |
| Bunch separation | 25 | ns |
| Number of bunches | 10080 |  |
| Bunch population | $4.0^{\prime} 10^{11}$ |  |
| Accumulated particles per beam | $4.0^{\prime} 10^{15}$ |  |
| Normalized rms transverse emittance | 1.2 | mm |
| Beam life time due to burn-off | 8.1 | hours |
| Total inelastic cross section | 161 | mb |
| Reduction factor in luminosity | 0.81 |  |
| Full crossing angle | 73 | mrad |
| rms bunch length | 60 | mm |
| rms IP spot size | 3.0 | mm |
| Beta at the first parasitic encounter | 28.6 | m |
| rms spot size at the first parasitic encounter | 22.7 | mm |
| Stored energy per beam | 4.0 | GJ |
| SR power per beam | 2.2 | MW |
| SR heat load at arc per aperture | 26.3 | W/m |
| Energy loss per turn | 11.4 | MeV |

*CEPC TDR

## SppC lattice design

- Compatible with CEPC, 100km, 2 IPs
- 8 arc sections
- 2-in-1 yoke-sharing magnets
- both interleaved and non-interleaved sextupoles studied
- 4 short straight sections
- RF region, dual-harmonic RF system (800 and 400 MHz )
- injection section after injection chain
- Space reserved for e-p collision
- 2 long straight sections
- collimation section for both betatron and momentum
- extraction section
- 2 interaction regions
- anti-symmetric interaction region
- chromaticity corrected with arc sextupoles

## Lattice optics

Collimation section

Dispersion suppressor

Interaction region

## Nonlinearity optimization with non-interleaved sextupoles

- 5 FODO cells per period. Most nonlinearities are cancelled in 4 periods and the tune shifts are significantly reduced compared with the interleaved scheme.
- Since the number of sextupoles is less than interleaved scheme, the sextupoles in arc will be stronger, thus the length of sextupoles is doubled to 1 m to weaken the sextupoles.

Tune shift coefficients and RDTs

## Content

- SppC lattice design and nonlinearity optimization
- Error correction scheme
- Geometric compatibility between CEPC and SppC

## SppC lattice error table

- Gaussian distribution, and truncated at $3 \sigma$;
- The table at top energy is similar with that at collider energy, except some field errors due to residual circuit caused by ramping down.

| Element | Error | Error desc. | Units | Main dipole | Separation dipole |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Dipole | $\sigma(\mathrm{x}), \sigma(\mathrm{y})$ |  | mm | 0.5 | 0.5 |
|  | $\sigma(\psi)$ | roll angle | mrad | 0.5 | 0.5 |
|  | $\sigma(\delta \mathrm{B} / \mathrm{B})$ | random b1 | \% | 0.1 | 0.05 |
|  | $\sigma(\delta B / B)$ | random b2 | $10^{-4}$ units | 0.9 | 0.1/1.1 |
|  | $\sigma(\delta B / B)$ | random a2 | $10^{-4}$ units | 1.0 | 0.1/0.2 |
|  | $\sigma(\delta B / B)$ | uncert. a2 | $10^{-4}$ units | 1.0 | TBD |
|  |  |  |  | Main quadrupole | IR triplet / other |
| Quad. | $\sigma(\mathrm{x}), \sigma(\mathrm{y})$ |  | mm | 0.5 | 0.15/0.5 |
|  | $\sigma(\psi)$ | roll angle | mrad | 0.5 | 0.05/0.5 |
|  | $\sigma(\delta B / B)$ | random b2 | \% | 0.1 | 0.005/0.1 |
| BPM | $\sigma(\mathrm{x}), \sigma(\mathrm{y})$ |  | mm | 0.2 | 0.2 |
|  | $\sigma($ read) |  | mm | 0.05 | 0.05 |

## SppC lattice correction scheme

## Based on response matrix method

- Software: Accelerator Toolbox (AT) on MATLAB

1. Apply the errors
2. First turn trajectory correction
3. Closed orbit correction with increasing sextupole strength
4. Beta-beating and horizontal dispersion correction (LOCO)
5. Coupling and vertical dispersion correction

6. Tune and chromaticity correction

Response matrix represents the relationship between the strength variation of the dipole correction magnet in the storage ring and the resulting closed orbit distortion of the beam:

$$
\binom{\Delta x}{\Delta y}=R\binom{\Delta \theta_{x}}{\Delta \theta_{y}}
$$

## SppC lattice correction scheme

938 BPMs and 477 dipole correctors installed near the quadrupoles in the ring.

## First turn trajectory correction:

- Use BPMs and dipole correctors to find the closed orbit, $85 \%$ of the machines with errors can be corrected successfully in this step.

## Closed orbit correction:

- Solve the equation with the response matrix of lattice: $\overrightarrow{\boldsymbol{u}}+\boldsymbol{A} \overrightarrow{\boldsymbol{\theta}}=\mathbf{0}$
$\vec{u}$ : vector of orbit at BPM, A: response matrix, $\vec{\theta}$ : vector of corrector strength
- Sextupole off, then after each $10 \%$ increase, the closed orbit is corrected once until the set value is reached.

Comparison of closed orbit before and after correction

Corrector strength less than $5 \mathrm{~T}^{*} \mathrm{~m}$

## SppC lattice correction scheme

## Beta-beating and horizontal dispersion correction:

- Use the LOCO program to fit the response matrix itself.
- Minimize the difference between measured and theoretical response matrix by varying the quadrupole strength to correct the beam envelope function:

$$
\chi^{2}=\sum_{i, j} \frac{\left(M_{m e a s, i j}-M_{m o d e l, i j}\right)^{2}}{\sigma^{2}}
$$

$\sigma$ : BPM noise given by multiple measurements of BPMs 。

Dispersion deviation before and after correction

Quadrupole variation less than 3\%

## SppC lattice correction scheme

## Coupling and vertical dispersion correction :

- Correct the linear coupling RDTs by the skew quadrupoles in lattice:

$$
\left(\frac{\overrightarrow{f_{1001}}}{\overrightarrow{f_{\underline{1010}}}}\right)_{\text {meas }}+M \overrightarrow{K_{s}}=0
$$

- $f_{1001}$ and $f_{1010}$ : RDTs of difference and sum resonance, respectively; $K_{S}$ : Skew quadrupole strength.
- Focus more on the correction of $f_{1001}$ since the tune is close to difference resonance.

Linear coupling RDTs
before and after correction

Skew quadrupole strength
less than $150 \mathrm{~T} / \mathrm{m}$

## SppC lattice correction results

## For collision

- 84 of 100 machines successfully corrected. Figures show the RMS results of those machines.

Residual orbit and beam size:

Dispersion deviation:

## SppC lattice correction results

## For collision

- From the maximum values distribution the 90 -percentile is calculated over all 84 machines.

## SppC lattice correction results

## For injection

- 82 of 100 machines successfully corrected. Figures show the RMS results of those machines.

Dispersion deviation:

Linear coupling:

Beta-beating:

## SppC lattice correction results

## For injection

- From the maximum values distribution the 90 -percentile is calculated over all 82 machines.

## Dynamic aperture

- Performed by SAD code, with error correction scheme and RF on;
- Tracking for 100,000 turns;
- Synchrotron radiation and beam-beam effect have not been included yet.

Can be further optimized

## Content

- SppC lattice design and nonlinearity optimization
- Error correction scheme
- Geometric compatibility between CEPC and SppC

## CEPC-SppC compatibility

- Geometry compatibility of the CEPC and SPPC
- The SPPC will share the tunnel of CEPC as much as possible.
- The SPPC locates outside of CEPC
- In the 8 arc regions and 4 short straight sections, two machines share the tunnel (distance of machine centers $=3.5 \mathrm{~m}$ )
- In the 4 long straight sections, the SPPC will bypass the CEPC (distance of machine centers at IPs $=23 \mathrm{~m}$ as the big size of CEPC and SPPC detectors)
- IP1 and IP3 for CEPC interaction and SPPC collimation, IP2 and IP4 for CEPC RF and SPPC interaction

Tunnel in the ARC

Figure 2.1: Tunnel cross section in the arc region

CEPC Layout

## With bypass

SPPC updated to double ring:

- Strength of dipole (arc and bypass): 20.31 T
- Swap at IP2 and IP4
- Double ring separation: 30 cm

Distance of two machine's centers:

- Separation with CEPC at ARC: 3.5 m
- Separation with CEPC at IPs: 23 m

Geometry of bypass at IP2 with a total length of 4399 m

Geometry of arc section

Geometry of bypass at IP3 with a total length of 5985.34 m

Without bypass for the absence of CEPC detectors SPPC updated to double ring:

- Strength of dipole (arc and bypass): 20.31 T
- Swap at IP2 and IP4
- Double ring separation: 30 cm

Distance of two machine's centers: 3.5 m

Geometric parameters of SPPC and CEPC

With bypass:

| Circumference | 100000 m | 100021.84 m | 100000.0 m |

*Arc including DIS sections

## Summary

- A global correction scheme based on response matrix method is presented. Lattices at both collision and injection energy with errors have been corrected.
- For the compatibility of CEPC and SppC, two kinds of SppC lattice design are presented for the presence or absence of bypass respectively.
- Further improve the global correction results to get a more relaxed tolerance.

Thanks for your attention!
