## Laser Photo Detachment for Sr-90 Detection

*Monday, 21 October 2024 16:55 (20 minutes)*

The rare radioisotope Sr-90 is one of the most important products of thermal neutron fission. On one hand, the Sr-90 yield from fission is relatively large; on the other hand,  $^{90}\text{Sr}$  is known for its bone-seeking radiotoxicity and the risk of causing bone cancer. Currently, researches related to  $^{90}\text{Sr}$  are facing the challenge of measuring the concentration of Sr-90 environmental samples, which could be as low as  $^{90}\text{Sr}/^{88}\text{Sr} \approx 10^{-14}$ .

Based on this challenge, we're now trying to apply laser photo-detachment on the measurement of Sr-90 at Micro Analysis Laboratory Tandem accelerator, The University of Tokyo (MALT), contents of this report will be focused on the experiments and simulations of LPD on a test bench.

### Student Submission

Yes

**Primary authors:** WANG, Lezhi (MALT, The University of Tokyo, Japan); MATSUZAKI, Hiroyuki (MALT, The University of Tokyo, Japan); MIYAKE, Yasuto (RIKEN, Japan); YAMAGATA, Takeyasu (MALT, The University of Tokyo, Japan)

**Presenter:** WANG, Lezhi (MALT, The University of Tokyo, Japan)

**Session Classification:** Poster Session A

**Track Classification:** New and Advanced AMS Techniques
