

## CMS MTD ETL detector in the Phase-2 upgrade

*Thursday, 15 August 2024 10:55 (15 minutes)*

The Compact Muon Solenoid (CMS) detector at the CERN Large Hadron Collider (LHC) is undergoing an extensive upgrade program to prepare for the challenging conditions of the High-Luminosity LHC (HL-LHC). A new timing detector in CMS will measure minimum ionizing particles (MIPs) with a time resolution of  $\sim 40$ - $50$  ps per hit and coverage up to  $|\eta|=3$ . The precision time information from this MIP Timing Detector (MTD) will reduce the effects of the high levels of pileup expected at the HL-LHC and will bring new and unique capabilities to the CMS detector. The endcap region of the MTD, called the endcap timing layer (ETL), must endure high fluences, motivating the use of thin, radiation tolerant silicon sensors with fast charge collection. As such, the ETL will be instrumented with silicon low-gain avalanche diodes (LGADs), covering the high-radiation pseudo-rapidity region  $1.6 < |\eta| < 3.0$ . This talk will present the physics motivation, current status and progress made for the ETL detector.
