Introduction: The concept of the electron spin

电子自旋的发现

Die Naturwissenschaften 13, 953–954 (1925)

Heft 47 · Zuschriften und vorläufige Mitteilungen. 953
20. 11. 1925

Ersetzung der Hypothese vom unmechanischen Zwang durch eine Forderung bezüglich des inneren Verhaltens jedes einzelnen Elektrons.

In Übereinstimmung zu kommen, muß man also diesem Modell die folgenden Forderungen stellen:

- Das Verhältnis des magnetischen Momentes des Elektrons zum mechanischen muß wie die Eigenaufstellung doppelt so groß sein als für die Umlaufbewegung.
- Die verschiedenen Orientierungen vom R zur Bahnebene (oder K) des Elektrons muß, vielleicht in Zusammenhang mit einer HEISENBERG-WENTZELSEN Mittelungsvorschrikt¹⁴, die Erklärung des Relativitätsdoubtless bestätigen.

G. E. UHLENBECK und S. GOUDSMIT,
Leiden, den 17. Oktober 1925.

Institut voor Theoretische Natuurkunde.
Es ist mir ein Bedürfnis, festzustellen, daß Prof. W. J. de HAAS mir schon vor einigen Monaten die Apparatur für ein sehr interessantes Experiment zeigte, das sich gleichzeitig mit dem Problem der Orientierung des Elektrons beschäftigt. Obwohl mir die betreffenden Ideen von Prof. DE HAAS seit längerer Zeit bekannt waren, hatten die Herren UHLENBECK und GOUDSMIT, als sie mir kürzlich die obigen Überlegungen mitteilten, davon keinerlei Kenntnis.

P. EHRENFEST.

George Uhlenbeck

Samuel Goudsmit

George Uhlenbeck left with his wife and son in 1940. He died in 1988. Samuel Goudsmit was born in 1902. He died in 1978. The photograph was taken in 1925, when they were both at Leiden University. The original photo is in black and white, but here it is colorized. The colors are based on the original photo and the clothing of the time. The background is a plain wall.

Spinning Electrons and the Structure of Spectra.

This moment of innumerable electrons given by $R_{21}R_{12}$, where $R_{ij} = \frac{1}{2}(1 - \cos \theta_{ij})$. The total angular momentum of the system is $J = \sum j_i$, where $j_i = 1, \frac{1}{2}, \dots$. The symbols $\alpha, \beta, \gamma, \delta$ represent the different states of the atomic classification of the Zeeman effects of the optical spectra. The Zeeman effect of the spectral lines is analogous with the structure of optical spectra which we consider below. The letters a, b, c, d represent the energy levels of the atoms, which are due to the motion in the absence of the spin of the electron.

The author is the same as in the article in the previous issue.

EINSTEIN.

In conclusion, we wish to acknowledge our indebtedness to Prof. Niels Bohr for an enlightening discussion, and for criticisms which helped us distinguish between the essential points and the more technical details of the new interpretation.

S. GOUDSMIT.

9

Introduction: The concept of the electron spin

Orbit angular momentum is non-zero even if the quark is in the ground state.

$$\hat{H}\psi = E\psi \quad \hat{H} = \vec{\alpha} \cdot \hat{\vec{p}} + \beta m + V(r)$$

The stationary state is taken as the eigenstate of $(\hat{H}, \hat{j}_z, \hat{n})$, where \hat{n} is parity:

$$\psi_{E,j,m,\pi}(r, \theta, \phi, S) = \begin{pmatrix} f_{nl}(r)\Omega_{jm}^l(\theta, \phi) \\ (-1)^{(l-l'+1)/2}g_{nl'}(r)\Omega_{jm}^{l'}(\theta, \phi) \end{pmatrix}$$

$$j = l \pm \frac{1}{2}, l - l' = \mp 1, \text{ and } \pi = (-1)^l$$

$\Omega_{jm}^l(\theta, \phi)$ is the eigenstate of $(\hat{j}^2, \hat{L}^2, \hat{j}_z)$:

$$\Omega_{jm}^l(\theta, \phi) = \sqrt{\frac{j+m}{2j}}Y_{l,m+\frac{1}{2}}(\theta, \phi)\xi\left(\frac{1}{2}\right) + \sqrt{\frac{j-m}{2j}}Y_{l,m-\frac{1}{2}}(\theta, \phi)\xi\left(-\frac{1}{2}\right) \quad j = l + \frac{1}{2}$$

$$\Omega_{jm}^{l'}(\theta, \phi) = -\sqrt{\frac{j-m+1}{2j+2}}Y_{l,m-\frac{1}{2}}(\theta, \phi)\xi\left(\frac{1}{2}\right) + \sqrt{\frac{j+m+1}{2j+2}}Y_{l,m+\frac{1}{2}}(\theta, \phi)\xi\left(-\frac{1}{2}\right) \quad j = l - \frac{1}{2}$$

REACTIONS INVOLVING POLARIZED PARTICLES OF ZERO REST MASS

CHOU KUANG-CHAO
Joint Institute for Nuclear Research
Joint Institute for Nuclear Research
Submitted to JETP editor May 21, 1959

J. Exptl. Theoret. Phys. (U.S.S.R.) **34**, 909-918 (March, 1959)

In this paper the group-theoretical point of view is used for the description of the spin states of particles of zero rest mass. Complex sets of operators and of their eigenfunctions for a spin-1/2 particle are introduced. The theory is applied to the description of the most important statistical sources for the particles produced in a reaction of the type $a + b \rightarrow c + d$ or $a + b \rightarrow c + d + e$. The theory is also applied to the description of the reactions $a + b \rightarrow c + d$ or $a + b \rightarrow c + d + e$ in the case where the particles produced in the reaction have zero rest mass. The most general selection rules are derived for the reaction $a + b \rightarrow c + d$ in the form of relations between the wave functions of the particles produced in the reaction. The wave functions are calculated for the reaction $e + e \rightarrow e + e$ and the selection rules for the wave functions are derived. The wave functions are calculated for a system of two identical particles of zero rest mass.

SOVIET PHYSICS JETP VOLUME 34(1), NUMBER 5 NOVEMBER, 1958

THE RELATIVISTIC THEORY OF REACTIONS INVOLVING POLARIZED PARTICLES

CHOU KUANG-CHAO AND M. I. SHIROKOV
Joint Institute for Nuclear Research
Submitted to JETP editor December 6, 1957

J. Exptl. Theoret. Phys. (U.S.S.R.) **34**, 1230-1239 (May, 1959)

It is shown that, in the rest system, the relativistic formulae for the angular distribution and the polarization of the particles produced in a reaction of the type $a + b \rightarrow c + d$ are essentially the same as the nonrelativistic formulae, if the spin of a particle is defined as its internal angular momentum. The theory is also applied to the description of the reactions $a + b \rightarrow c + d + e$ and $a + b \rightarrow c + d + e + f$. The main difference from the nonrelativistic case is that the description of the spin state takes into account the fact that the particles produced in the reaction have zero rest mass. The main difference from the nonrelativistic case is that the description of the spin state takes into account the fact that the particles produced in the reaction have zero rest mass. (For example, for experiments on double scattering corrections must be applied to the nonrelativistic formulae. The relativistic changes in the angular correlations are indicated for successive reactions of the type $e + e \rightarrow e + e$, $V \rightarrow V + V$.)

18

Description of spin states: spin-1/2 particles

$$\text{Helicity (螺旋度)} \hat{h} \equiv \frac{\vec{\Sigma} \cdot \vec{p}}{|\vec{p}|}$$

① Only for particles with given \vec{p}

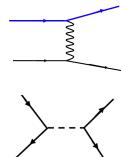

② Neither additive nor multiplicative

③ Lorentz invariant for $m = 0$, helicity=chirality

④ Helicity conservation:

● scattering: $h_{\text{in}} = h_{\text{final}}$

● pair creation/annihilation: $h_{\text{particle}} = -h_{\text{antiparticle}}$

$$\psi = \psi_L + \psi_R \quad \psi_{L/R} = \frac{1}{2}(1 \pm \gamma_5)\psi$$

$$\psi\psi = \psi_L\psi_R + \psi_R\psi_L \quad \psi\gamma_\mu\psi = \psi_L\gamma_\mu\psi_L + \psi_R\gamma_\mu\psi_R$$

The most well-known example: $\sigma(\pi^- \rightarrow \mu^- \nu_\mu) \gg \sigma(\pi^- \rightarrow e^- \nu_e)$

Description of quark spin correlations —— decomposition

For single particle, we decompose

$$\hat{\rho}^{(1)} = \frac{1}{2} (\mathbb{I} + P_{1i} \hat{\sigma}_{1i}) \quad P_{1i} = \langle \hat{\sigma}_{1i} \rangle = \text{Tr}[\hat{\rho}^{(1)} \hat{\sigma}_{1i}]$$

For two particle system (12),

$$\begin{aligned} \text{we are used to} \quad \hat{\rho}^{(12)} &= \frac{1}{2^2} (\mathbb{I}_1 \otimes \mathbb{I}_2 + P_{1i} \hat{\sigma}_{1i} \otimes \mathbb{I}_2 + P_{2i} \mathbb{I}_1 \otimes \hat{\sigma}_{2i} + t_{ij}^{(12)} \hat{\sigma}_{1i} \otimes \hat{\sigma}_{2j}) \\ \text{shortage:} \quad t_{ij}^{(12)} &= P_{1i} P_{2j} \neq 0 \quad \text{if} \quad \hat{\rho}^{(12)} = \hat{\rho}^{(1)} \otimes \hat{\rho}^{(2)} \end{aligned}$$

$$\begin{aligned} \text{we propose} \quad \hat{\rho}^{(12)} &= \hat{\rho}^{(1)} \otimes \hat{\rho}^{(2)} + \frac{1}{2^2} c_{ij}^{(12)} \hat{\sigma}_{1i} \otimes \hat{\sigma}_{2j} \\ c_{ij}^{(12)} &= \langle \hat{\sigma}_{1i} \hat{\sigma}_{2j} \rangle - \langle \hat{\sigma}_{1i} \rangle \langle \hat{\sigma}_{2j} \rangle \quad c_{ij}^{(12)} = 0 \text{ if } \hat{\rho}^{(12)} = \hat{\rho}^{(1)} \otimes \hat{\rho}^{(2)} \end{aligned}$$

For three particle system (123)

$$\begin{aligned} \hat{\rho}^{(123)} &= \hat{\rho}^{(1)} \otimes \hat{\rho}^{(2)} \otimes \hat{\rho}^{(3)} + \frac{1}{2^3} [c_{ij}^{(12)} \hat{\sigma}_{1i} \otimes \hat{\sigma}_{2j} \otimes \hat{\rho}^{(3)} + (\mathbf{1} \rightarrow \mathbf{2} \rightarrow \mathbf{3})] \\ &\quad + \frac{1}{2^3} c_{ijk}^{(123)} \hat{\sigma}_{1i} \otimes \hat{\sigma}_{2j} \otimes \hat{\sigma}_{3k} \end{aligned}$$

27

Description of quark spin correlations —— α -dependence

Single particle: $\hat{\rho}^{(1)}(\alpha) = \frac{1}{2} [\mathbb{I} + P_{1i}(\alpha) \hat{\sigma}_{1i}]$

Two particle system A=(12): $\hat{\rho}^{(12)}(\alpha_1, \alpha_2) = \hat{\rho}^{(1)}(\alpha_1) \otimes \hat{\rho}^{(2)}(\alpha_2) + \frac{1}{2^2} c_{ij}^{(12)}(\alpha_1, \alpha_2) \hat{\sigma}_{1i} \otimes \hat{\sigma}_{2j}$

Suppose A=(12) is in the state $|\alpha_{12}\rangle$, the α_{12} -dependent spin density matrix for A is

$$\begin{aligned} \hat{\rho}^{(12)}(\alpha_{12}) &= \langle \alpha_{12} | \hat{\rho}^{(12)}(\alpha_1, \alpha_2) | \alpha_{12} \rangle = \sum_{\alpha_1 \alpha_2} |\langle \alpha_1, \alpha_2 | \alpha_{12} \rangle|^2 \hat{\rho}^{(12)}(\alpha_1, \alpha_2) \\ &= \hat{\rho}^{(1)}(\alpha_{12}) \otimes \hat{\rho}^{(2)}(\alpha_{12}) + \frac{1}{2^2} c_{ij}^{(12)}(\alpha_{12}) \hat{\sigma}_{1i} \otimes \hat{\sigma}_{2j} \end{aligned}$$

average inside A

$$\hat{\rho}^{(1)}(\alpha_{12}) = \sum_{\alpha_1 \alpha_2} |\langle \alpha_1, \alpha_2 | \alpha_{12} \rangle|^2 \hat{\rho}^{(1)}(\alpha_1) = \frac{1}{2} [\mathbb{I} + P_{1i}(\alpha_{12}) \hat{\sigma}_{1i}]$$

The polarization $P_{1i}(\alpha_{12}) = \sum_{\alpha_1 \alpha_2} |\langle \alpha_1, \alpha_2 | \alpha_{12} \rangle|^2 P_{1i}(\alpha_1) \equiv \langle P_{1i}(\alpha_1) \rangle$ equals to P_{1i} averaged inside A

However, the correlation $c_{ij}^{(12)}(\alpha_{12}) \neq \langle c_{ij}^{(12)}(\alpha_1, \alpha_2) \rangle$ does not equal to $c_{ij}^{(12)}$ averaged inside A

instead $c_{ij}^{(12)}(\alpha_{12}) = \langle c_{ij}^{(12)}(\alpha_1, \alpha_2) \rangle + c_{ij}^{(12,0)}(\alpha_{12})$

"effective correlation" = "genuine correlation" + "induced correlation"

the observed generated from the dynamical process caused by the average over α_i

$$c_{ij}^{(12,0)}(\alpha_{12}) \equiv \langle P_{1i}(\alpha_1) P_{2j}(\alpha_2) \rangle - \langle P_{1i}(\alpha_1) \rangle \langle P_{2j}(\alpha_2) \rangle$$

Description of polarization of the photon

Circular polarization of the photon:

$$\text{in the helicity state} \quad \rho_Y^{circ} = \frac{1}{2} \begin{pmatrix} 1 + P_{circ} & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 1 - P_{circ} \end{pmatrix}$$

Linear polarization of the photon:

linearly polarized along OX or OY \iff in state $|\varepsilon_{(x)}\rangle$ or $|\varepsilon_{(y)}\rangle$

$$\rho_Y^{lin(x)} = \frac{1}{2} \begin{pmatrix} 1 & 0 & -P_{lin} \\ 0 & 0 & 0 \\ -P_{lin} & 0 & 1 \end{pmatrix} \quad \rho_Y^{lin(y)} = \frac{1}{2} \begin{pmatrix} 1 & 0 & P_{lin} \\ 0 & 0 & 0 \\ P_{lin} & 0 & 1 \end{pmatrix}$$

$$\text{in OXY plane at an angle } \gamma \text{ to OX} \quad \rho_Y^{lin} = \frac{1}{2} \begin{pmatrix} 1 & 0 & -P_{lin} e^{-2i\gamma} \\ 0 & 0 & 0 \\ -P_{lin} e^{2i\gamma} & 0 & 1 \end{pmatrix}$$

$$\rho_Y^{lin} = \frac{1}{2} \begin{pmatrix} 1 & 0 & -P_{lin} e^{-2i\gamma} \\ 0 & 0 & 0 \\ -P_{lin} e^{2i\gamma} & 0 & 1 \end{pmatrix} \rightarrow \frac{1}{2} \begin{pmatrix} 1 & -P_{lin} e^{-2i\gamma} & 0 \\ -P_{lin} e^{2i\gamma} & 1 & 0 \end{pmatrix} = \frac{1}{2} [1 - P_{lin}(\sigma_x \cos 2\gamma + \sigma_y \sin 2\gamma)]$$

Description of polarization of particles with different spins

Spin 1/2 hadrons:

The spin density matrix is 2x2: $\hat{\rho} = \begin{pmatrix} \rho_{++} & \rho_{+-} \\ \rho_{-+} & \rho_{--} \end{pmatrix} = \frac{1}{2}(1 + \vec{S} \cdot \vec{\sigma})$

Vector polarization: $S^\mu = (0, \vec{S}_r, \lambda)$

Spin 1 hadrons:

See e.g. A. Bacchetta, & P.J. Mulders, PRD62, 114004 (2000)

The spin density matrix is 3x3: $\rho = \begin{pmatrix} \rho_{11} & \rho_{10} & \rho_{1-1} \\ \rho_{01} & \rho_{00} & \rho_{0-1} \\ \rho_{-11} & \rho_{-10} & \rho_{-1-1} \end{pmatrix} = \frac{1}{3}(1 + \frac{3}{2}\vec{S} \cdot \vec{\Sigma} + 3T^0\Sigma^0)$

Vector polarization: $S^\mu = (0, \vec{S}_r, \lambda)$

Tensor polarization: $S_{LL}, S_{LT}^i = (S_{LT}^x, S_{LT}^y), S_{TT}^{ij} = \begin{pmatrix} S_{TT}^{xx} & S_{TT}^{xy} \\ S_{TT}^{yy} & -S_{TT}^{xx} \end{pmatrix}$ 3 independent components

Spin 3/2 hadrons:

See e.g. Jing Zhao, Zhe Zhang, ZTL, Tianbo Liu, Ya-jin Zhou, PRD106, 094006 (2022)

The spin density matrix is 4x4: $\hat{\rho} = \frac{1}{4}(1 + \frac{4}{5}S^0\Sigma^0 + \frac{2}{3}T^{ij}\Sigma^{ij} + \frac{8}{9}R^{ijk}\Sigma^{ijk})$

Vector polarization: $S^\mu = (0, \vec{S}_r, \lambda)$

Tensor polarization: $S_{LL}, S_{LT}^i = (S_{LT}^x, S_{LT}^y), S_{TT}^{ij} = \begin{pmatrix} S_{TT}^{xx} & S_{TT}^{xy} \\ S_{TT}^{yy} & -S_{TT}^{xx} \end{pmatrix}$ 3 independent components (rank 2)

Tensor polarization: $S_{LLL}, S_{LLT}^i = (S_{LLT}^x, S_{LLT}^y), S_{TTT}^{ijk} = \begin{pmatrix} S_{TTT}^{xxx} & S_{TTT}^{xyx} \\ S_{TTT}^{yyx} & -S_{TTT}^{xxx} \end{pmatrix}$ 5 independent components (rank 3)

Polarization measurements: hyperon polarization

Two body decay $A \rightarrow 1 + 2$

In the rest frame of A

$$\begin{aligned} p_A &= (M_A, 0, 0, 0) & p_1 &= (E_1, \vec{p}_1^*) & p_2 &= (E_2^*, \vec{p}_2^*) & \vec{p}_1^* &= -\vec{p}_2^* = \vec{p}^* \\ p_A &= p_1 + p_2 & E_1^* &= (M_A^2 + m_1^2 - m_2^2)/2M_A \end{aligned}$$

For unpolarized (or spinless) A, the decay product is isotropic.

$$\frac{d^3N}{d\vec{p}_1} = \frac{1}{4\pi \vec{p}^*} \delta(|\vec{p}_1| - |\vec{p}^*|) \quad \frac{dN}{d\Omega} = \frac{1}{4\pi}$$

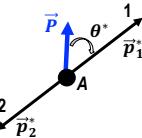

For parity conserved decays of A, the decay product is isotropic.

For parity violating decay of the hyperon,

$$\frac{dN}{d\Omega} = \frac{1}{4\pi} \left(1 + \alpha \vec{P} \cdot \frac{\vec{p}_1^*}{|\vec{p}_1^*|} \right) = \frac{1}{4\pi} (1 + \alpha P \cos \theta^*)$$

Spin self analyzing parity violating weak decay of the hyperon A .

α : the decay polarization parameter, listed in PDG.

43

Polarization measurements: hyperon polarization

More completely

$A \rightarrow 1 + 2$, e.g., $\Lambda \rightarrow p\pi^-$

Phys. Rev.

106, 1645 (1957)

General Partial Wave Analysis of the Decay of a Hyperon of Spin $\frac{1}{2}$

T. D. Lee* and C. N. Yang
Institute for Advanced Study, Princeton, New Jersey

(Received October 22, 1957)

$$\frac{dN}{d\Omega} = \frac{1}{4\pi} (1 + \alpha \vec{P}_A \cos \theta^*)$$

$$\vec{p}_1 = \frac{(\alpha + \vec{P}_A \cdot \vec{e}_1)\vec{e}_1 + \beta \vec{e}_1 \times \vec{P}_A + \gamma (\vec{e}_1 \times \vec{P}_A) \times \vec{e}_1}{1 + \alpha \vec{P}_A \cdot \vec{e}_1}$$

$$\alpha = \frac{2\text{Re}(S^*P)}{|S|^2 + |P|^2} \quad \beta = \frac{2\text{Im}(S^*P)}{|S|^2 + |P|^2} \quad \gamma = \frac{|S|^2 - |P|^2}{|S|^2 + |P|^2} \quad \alpha^2 + \beta^2 + \gamma^2 = 1$$

Parity conserved: $S = 0$, so that $\alpha = 0, \beta = 0, \gamma = -1$

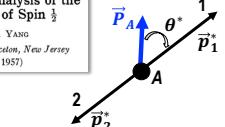

or using (α, ϕ) : $\phi = \tan^{-1} \frac{\gamma}{\beta}, \beta = (1 - \alpha^2)^{\frac{1}{2}} \cos \phi, \gamma = (1 - \alpha^2)^{\frac{1}{2}} \sin \phi$

Parity conserved: $\alpha = 0, \phi = -\pi/2$

$\alpha, \beta, \gamma, \phi$: decay parameters listed in PDG.

Can also be derived from $M \sim u(A)(\alpha - \gamma_5 b)u(1)$

$$S \sim \alpha, \quad P \sim b |\vec{p}_1| / (E_1 + m_1)$$

Polarization measurements: $A \rightarrow 1 + 2$

Consider $A \rightarrow 1 + 2$ in the rest frame of A

Suppose the spin density matrix of A is $\hat{\rho}_A = \sum_M g_{M_A} |S_A, M_A\rangle \langle S_A, M_A|$

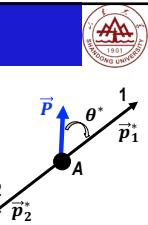

The spin density matrix of the system (12) is $\hat{\rho}_{12} = \hat{U} \hat{\rho}_A \hat{U}^\dagger$

The angular distribution

helicity state of (12)

$$\begin{aligned} W(\theta, \varphi) &= N \sum_{\lambda_1 \lambda_2} \langle \vec{p}; \lambda_1 \lambda_2 | \hat{\rho}_{12} | \vec{p}; \lambda_1 \lambda_2 \rangle = N \sum_{\lambda_1 \lambda_2} \langle \vec{p}; \lambda_1 \lambda_2 | \hat{U} \hat{\rho}_A \hat{U}^\dagger | \vec{p}; \lambda_1 \lambda_2 \rangle \\ &= N \sum_{\lambda_1 \lambda_2; M_A M'_A} \langle \vec{p}; \lambda_1 \lambda_2 | \hat{U} | S_A, M_A \rangle \langle S_A, M_A | \hat{\rho}_A | S_A, M'_A \rangle \langle S_A, M'_A | \hat{U}^\dagger | \vec{p}; \lambda_1 \lambda_2 \rangle \\ &= N \sum_{\lambda_1 \lambda_2; M_A M'_A} A_{M_A}(\vec{p}; \lambda_1 \lambda_2) A_{M'_A}^*(\vec{p}; \lambda_1 \lambda_2) \langle S_A, M_A | \hat{\rho}_A | S_A, M'_A \rangle \end{aligned}$$

$A_{M_A}(\vec{p}; \lambda_1 \lambda_2) = \langle \vec{p}; \lambda_1 \lambda_2 | \hat{U} | S_A, M_A \rangle$ the decay amplitude of A in the state $|S_A, M_A\rangle$ to (12) in the state $|\vec{p}, \lambda_1, \lambda_2\rangle$ with helicities λ_1 and λ_2

复旦大学

2024年8月5-6日

45

45

Polarization measurements: $A \rightarrow 1 + 2$

The decay amplitude is $A_m(\vec{p}; \lambda_1, \lambda_2) = \langle \vec{p}; \lambda_1, \lambda_2 | \hat{U} | S_A, M_A \rangle$

Space rotation invariance demands

- total angular momentum conservation

$$A_m(\vec{p}; \lambda_1, \lambda_2) = \langle \vec{p}; \lambda_1, \lambda_2 | E, S_A, M_A; \lambda_1, \lambda_2 | E, J = S_A, M = M_A; \lambda_1, \lambda_2 | \hat{U} | S_A, M_A \rangle$$

- Wigner-Eckhard theorem

$$\langle S_A, M_A; \lambda_1, \lambda_2 | \hat{U} | S_A, M_A \rangle = \langle S_A; \lambda_1, \lambda_2 | \hat{U} | S_A \rangle = H_{S_A}(\lambda_1, \lambda_2)$$

Helicity amplitude, independent of M_A , independent of angles (θ, φ) .

$$\text{Hence } A_m(\vec{p}; \lambda_1, \lambda_2) = \langle \vec{p}; \lambda_1, \lambda_2 | E, S_A, M_A; \lambda_1, \lambda_2 | H_{S_A}(\lambda_1, \lambda_2) \rangle$$

The angular dependence is determined by $\langle \vec{p}; \lambda_1, \lambda_2 | E, S_A, M_A; \lambda_1, \lambda_2 \rangle$

复旦大学

2024年8月5-6日

46

46

Polarization measurements: $A \rightarrow 1 + 2$

Calculation of $\langle p, \theta, \varphi; \lambda_1, \lambda_2 | p, J, M; \lambda_1, \lambda_2 \rangle$

It can be shown that $\langle p, 0, 0; \lambda_1, \lambda_2 | p, J, M; \lambda_1, \lambda_2 \rangle = \left(\frac{2J+1}{4\pi} \right)^{1/2}$

$$|p, \theta, \varphi; \lambda_1, \lambda_2 \rangle = \hat{R}(\varphi, \theta, -\varphi) |p, 0, 0; \lambda_1, \lambda_2 \rangle$$

Any rotation can be described by three Euler angles (α, β, γ)

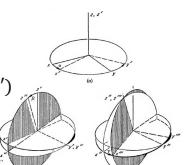

- (1) a rotation of angle α around z -axis $(x, y, z) \rightarrow (x', y', z')$
- (2) a rotation of angle β around y' -axis $(x', y', z') \rightarrow (x'', y'', z'')$
- (3) a rotation of angle γ around z'' -axis $(x'', y'', z'') \rightarrow (x''', y''', z''')$

The rotation operator $\hat{R}_n(\alpha) = e^{-i\alpha \hat{J}_n}$

$$\hat{R}(\alpha, \beta, \gamma) = \hat{R}_{z''}(\gamma) \hat{R}_{y'}(\beta) \hat{R}_z(\alpha)$$

$$\hat{R}_{y'}(\beta) = \hat{R}_z(\alpha) \hat{R}_y(\beta) \hat{R}_z^{-1}(\alpha)$$

$$\hat{R}(\alpha, \beta, \gamma) = \hat{R}_z(\alpha) \hat{R}_y(\beta) \hat{R}_z(\gamma) = e^{-i\alpha \hat{J}_z} e^{-i\beta \hat{J}_y} e^{-i\gamma \hat{J}_z}$$

Polarization measurements: vector meson

For $V \rightarrow 1 + 2$, where 1 and 2 are two pseudoscalar mesons, i.e., $S_A = 1, \lambda_1 = \pm \frac{1}{2}, \lambda_2 = \pm \frac{1}{2}$

consider the case: (1) Helicity conservation: $\lambda_1 = -\lambda_2, \lambda = \pm 1$

(2) Space reflection invariance: $H_A(\lambda_1, \lambda_2) = H_A(-\lambda_1, -\lambda_2)$

only one independent helicity amplitude

e.g., $J/\psi \rightarrow e^+ e^-$

$$W(\theta, \varphi) = \frac{3}{4\pi(3 + \lambda_\theta)} [1 + \lambda_\theta \cos^2 \theta + \lambda_\varphi \sin^2 \theta \cos 2\varphi + \lambda_{\theta\varphi} \sin 2\theta \cos \varphi + \lambda_\varphi^\perp \sin^2 \theta \sin 2\varphi + \lambda_{\theta\varphi}^\perp \sin 2\theta \sin \varphi]$$

$$\lambda_\theta = \frac{1 - 3\rho_{00}}{1 + \rho_{00}} \quad \lambda_\varphi = \frac{2\text{Re}\rho_{1-1}}{1 + \rho_{00}} \quad \lambda_{\theta\varphi} = \frac{2\text{Im}\rho_{-11}}{1 + \rho_{00}}$$

$$\lambda_\varphi^\perp = \frac{\sqrt{2}\text{Re}(\rho_{01} - \rho_{-10})}{1 + \rho_{00}} \quad \lambda_{\theta\varphi}^\perp = \frac{\sqrt{2}\text{Im}(\rho_{01} - \rho_{-10})}{1 + \rho_{00}}$$

Polarization measurements: vector meson

For $V \rightarrow 1 + 2$, where 1 and 2 are two pseudoscalar mesons, we have $S_A = 1, \lambda_1 = \lambda_2 = 0$

e.g., $\rho \rightarrow \pi\pi$

$$\begin{aligned} W(\theta, \varphi) &= N \sum_{M_A, M'_A} |H_A|^2 D_{M_A 0}^{1*}(\varphi, \theta, -\varphi) D_{M'_A 0}^1(\varphi, \theta, -\varphi) \langle M_A | \hat{p}_A | M'_A \rangle \\ &= \frac{3}{8\pi} \{ (1 - \rho_{00}) + (3\rho_{00} - 1) \cos^2 \theta \\ &\quad - \sqrt{2} \sin 2\theta [\cos \varphi (\text{Re}\rho_{10} - \text{Re}\rho_{-10}) - \sin \varphi (\text{Im}\rho_{10} + \text{Im}\rho_{-10})] \\ &\quad - 2\sin^2 \theta (\cos 2\varphi \text{Re}\rho_{1-1} + \sin 2\varphi \text{Im}\rho_{1-1}) \} \\ &\int_0^{2\pi} d\varphi W(\theta, \varphi) = \frac{3}{4} [(1 - \rho_{00}) + (3\rho_{00} - 1) \cos^2 \theta] \end{aligned}$$

Polarization measurements: Spin-1/2 Hyperon

For $H \rightarrow N\pi$, $S_A = \frac{1}{2}, \lambda_1 = \pm \frac{1}{2}, \lambda_2 = 0$

$$W(\theta, \varphi) = \frac{1}{4\pi} (1 + \alpha P \cos \theta + \alpha \sin \theta \cos \varphi \text{Re}\rho_{+-} + \alpha \sin \theta \sin \varphi \text{Im}\rho_{+-})$$

$$\alpha = \frac{\left| H_A \left(\frac{1}{2} \right) \right|^2 - \left| H_A \left(-\frac{1}{2} \right) \right|^2}{\left| H_A \left(\frac{1}{2} \right) \right|^2 + \left| H_A \left(-\frac{1}{2} \right) \right|^2}$$

$$P = \rho_{++} - \rho_{--}$$

$$\text{If space reflection invariance} \quad H_A \left(\frac{1}{2} \right) = H_A \left(-\frac{1}{2} \right) \quad \alpha = 0$$

Polarization measurements: Spin-3/2 baryon

For $A \rightarrow 1 + 2$, $S_A = \frac{3}{2}$, $S_1 = \frac{1}{2}$, $S_2 = 0$, e.g. $\Delta \rightarrow N\pi$ or $\Omega \rightarrow \Lambda K$

$$W(\theta, \varphi) = \frac{1}{8\pi} \left\{ 2 + (1 - 3\cos^2\theta)S_{LL} - (S_{LT}^x \cos\phi + S_{LT}^y \sin\phi) \sin 2\theta - \sin^2\theta(S_{TT}^{xx} \cos 2\phi + S_{TT}^{xy} \sin 2\phi) \right. \\ + \alpha_A \left[\frac{4}{5}(S_L \cos\theta + S_T^x \sin\theta \cos\phi + S_T^y \sin\theta \sin\phi) \right. \\ - \frac{1}{2}(3\cos\theta + 5\cos 3\theta)S_{LLL} - \frac{3}{4}(\sin\theta + 5\cos 3\theta)(S_{LLT}^x \cos\phi + S_{LLT}^y \sin\phi) \\ \left. \left. - 3\sin^2\theta \cos\theta(S_{LTT}^{xx} \cos 2\phi + S_{LTT}^{xy} \sin 2\phi) - \sin^3\theta(S_{TTT}^{xxx} \cos 3\phi + S_{TTT}^{xxy} \sin 3\phi) \right] \right\}$$

If integrate over ϕ

$$W(\theta) = \frac{1}{4} \left\{ 2 + (1 - 3\cos^2\theta)S_{LL} + \alpha_A \left[\frac{4}{5}S_L \cos\theta - \frac{1}{2}(3\cos\theta + 5\cos 3\theta)S_{LLL} \right] \right\}.$$

only longitudinal components can be measured

$$\text{If parity conserved, } \alpha_A = 0 \quad W(\theta) = \frac{1}{4} \left\{ 2 + (1 - 3\cos^2\theta)S_{LL} \right\}.$$
