Double-Parton Scattering

- Tremendous success of single-parton scattering picture
- Double-parton scattering has attracted lots of attention

MPI@LHC, starts at 2008

14th International workshop on Multiple Partonic Interactions at the LHC (MPI@LHC 2023) 20-24 November 2023. Manchester, United Kingdom (C23-11-20.1)

Double-parton PDF

A double copy of single-parton pdf?

- Proton is a quantum wave packet.
- Take two partons and integrate out the rest

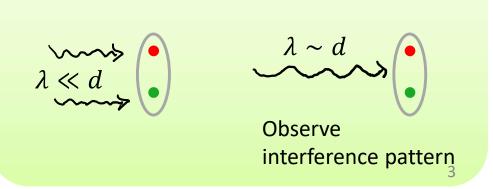

Quantum correlation in transverse position, spin, flavor and color...

Nonperturbative, can be calculated on lattice Zhang, Jian-Hui, arXiv:2304.12481 e.g. spin correlation of electrons

$$|\psi\rangle = \frac{1}{\sqrt{2}} \Big(|\uparrow\downarrow\rangle - |\downarrow\uparrow\rangle\Big)$$

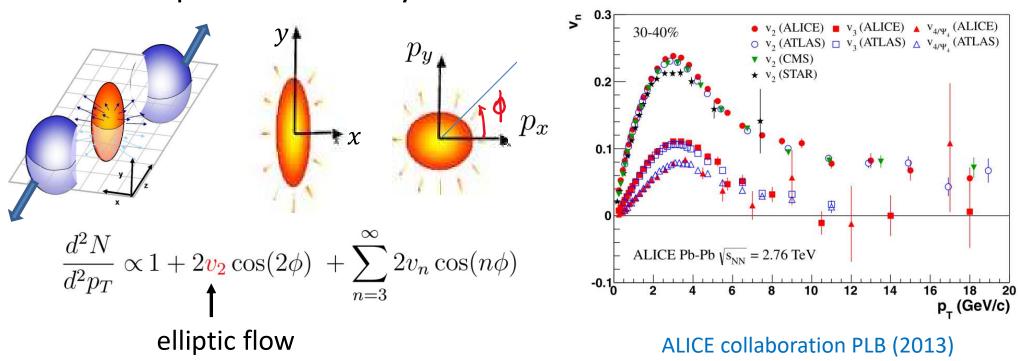

Observables

- Observables:
 - Current calculations focus on double-hard scattering
 - Soft radiation is a simpler probe Li, Qian, Wu, HZ, JHEP 2023

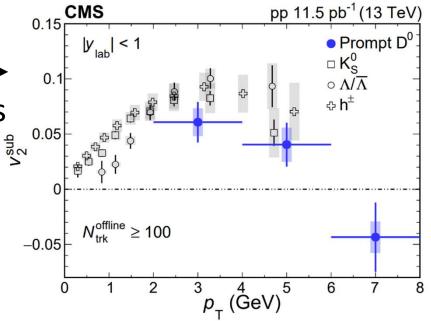

e.g. probe coupled electrons with light beams

• Anisotropic flow in heavy ion collisions

Surprise!

- $v_2 \neq 0$ in high-multiplicity pp collisions
 - As large as 0.1
- Previous explanations:
 - Final state interaction (hydrodynamics or transport)
 - Initial state interaction (Color-Glass-Condensate) CMS collaboration PLB (2021)

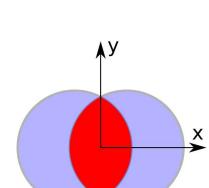

Surprise!

- $v_2 \neq 0$ in high-multiplicity pp collisions
 - As large as 0.1
- Previous explanations:
 - Final state interaction (hydrodynamics or transport)
 - Initial state interaction (Color-Glass-Condensate) CMS collaboration PLB (2021)
- New idea: overlap of wave functions
 Sensitive to geometry: needs multi-parton scattering
 - Large *pT* particles can only see a single parton, causing small v₂
 - ✓ Small pT particles cannot resolve the overlapped region, causing small v_2 .
 - ✓ **Transition** from single-parton process to multi-parton process

- Summary

Theoretical Framework

- To study this effect, we consider $\pi\pi$ scattering
 - > Approx. $|\pi\rangle = |q\bar{q}\rangle$, strongest interference
 - > Focus on soft radiation with small rapidity, the eikonal appox. is qualified.

$$\begin{aligned} \frac{d\hat{\sigma}}{d^2\mathbf{b}d\eta d^2\mathbf{k}} = &8\alpha_s^3 C_F |\mathbf{J}(\{\mathbf{x}_i\})|^2\\ \mathbf{J}(\{\mathbf{x}_i\}) \equiv \int \frac{d^2\mathbf{l}}{(2\pi)^2} \frac{1}{|\mathbf{l}|^2} \left(e^{-i\mathbf{l}\cdot\mathbf{x}_3} - e^{-i\mathbf{l}\cdot\mathbf{x}_4}\right) \left(\frac{\mathbf{k}}{|\mathbf{k}|^2} - \frac{\mathbf{k}-\mathbf{l}}{|\mathbf{k}-\mathbf{l}|^2}\right) \left[e^{i(\mathbf{l}-\mathbf{k})\cdot\mathbf{x}_1} - e^{i(\mathbf{l}-\mathbf{k})\cdot\mathbf{x}_2}\right] \end{aligned}$$

The integral is finite with nontrivial divergence cancellation

•
$$l = 0$$
 • $l = k$ • $l \to \infty$

Small k limit of v_2

✓ Small *k* particles cannot resolve the overlapped region.

Large k limit of
$$\mathcal{V}_{2}$$

$$\lim_{k_{T}\to\infty} |\mathbf{J}|^{2} = \frac{1}{|\mathbf{k}|^{4}} \left\{ B_{1} + \left[\sum_{\substack{m,n=1\\m\neq n}}^{4} f_{mn} + \sum_{\substack{n=1,2\\m=3,4}}^{2} g_{mn} \cos(2\phi) + \sum_{\substack{n=1,2\\m=3,4}}^{2} h_{mn} \sin(2\phi) \right] \right\} + \mathcal{O}\left(\frac{1}{|\mathbf{k}|^{6}}\right)$$

$$\mathbf{cos}\left[|\mathbf{k}| |\mathbf{x}_{m}| \cos(\theta_{m} - \phi) - |\mathbf{k}| |\mathbf{x}_{n}| \cos(\theta_{n} - \phi) \right] \right\} + \mathcal{O}\left(\frac{1}{|\mathbf{k}|^{6}}\right)$$

$$\theta_{m} = \arg \vec{x}_{m}, \phi = \arg \vec{k}, \text{ coefficients do not depend on } \theta_{i} \text{ and } \phi$$

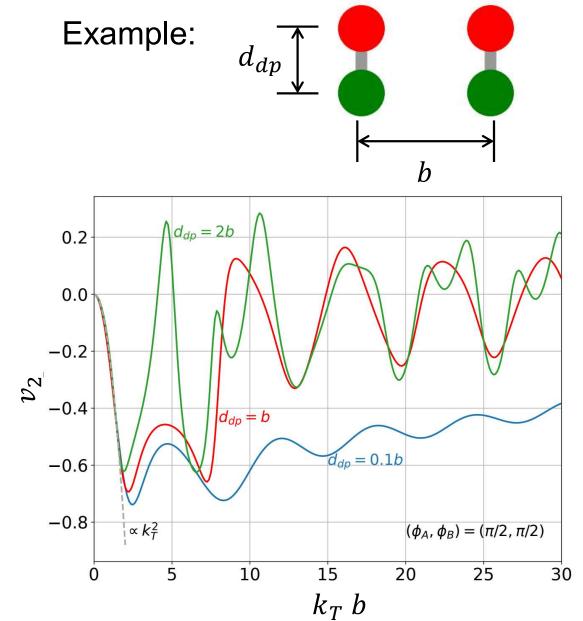

$$\lim_{k_{T}\to\infty} \int_{0}^{2\pi} d\phi |\mathbf{J}|^{2} = \frac{2\pi}{|\mathbf{k}|^{4}} B_{1} + \frac{2\pi}{|\mathbf{k}|^{4}} \left[\sum_{m,n=1}^{4} f_{mn} J_{0}\left(|\mathbf{k}| \overline{x}_{mn} \right) - \sum_{\substack{n=1,2\\m=3,4}}^{2} g_{mn} J_{2}\left(|\mathbf{k}| \overline{x}_{mn} \right) \right] + \mathcal{O}\left(\frac{1}{|\mathbf{k}|^{6}}\right)$$

$$u = \int_{0}^{1} \frac{J_{0}\left(|\mathbf{k}| \overline{x}_{mn} \right)}{J_{0}\left(|\mathbf{k}| \overline{x}_{mn} \right)} + \int_{0}^{2} \frac{J_{0}\left(|\mathbf{k}| \overline{x}_{mn} \right)}{J_{0}\left(|\mathbf{k}| \overline{x}_{mn} \right)} + \mathcal{O}\left(\frac{1}{|\mathbf{k}|^{6}}\right)$$
Interference pattern

8 10

Dipole-dipole Scattering I

Strong interference exists!

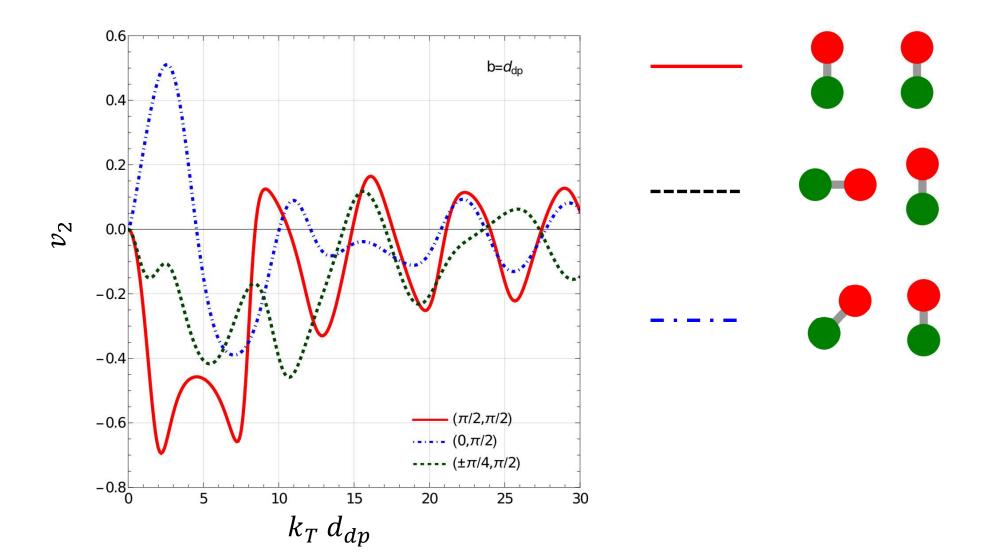

- With $d_{dp} = 0.1b$, b, 2b
- For all curves, $v_2 \propto -(k_T b)^2$ at small $k_T b$
- Strong oscillation exists at large $k_T b$
- With d_{dp} fixed, v_2 changes sign for small b
- With d_{dp} fixed, v_2 is always negative with large b.

Dipole-dipole Scattering II

• Strong destructive interference for dipoles with different angles.

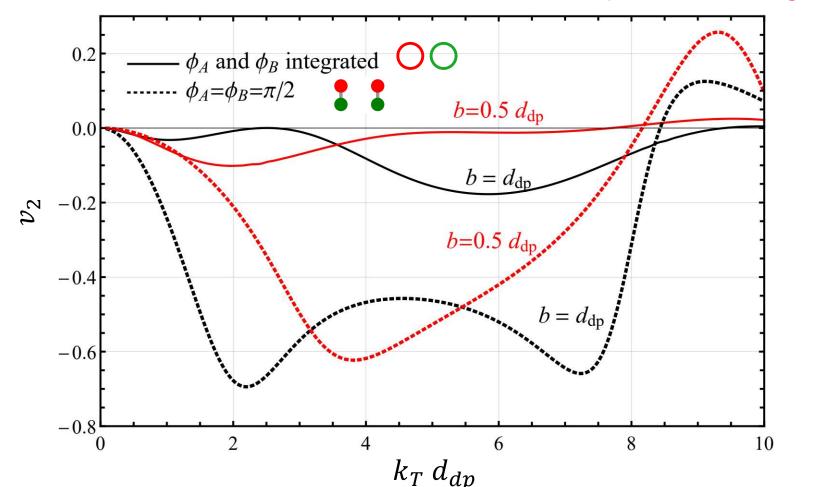

Fix $b = d_{dp}$

10

Average over Angles

- v_2 decreases by a factor of 4 with dipole angle integrated
- v_2 with angle integrated is mainly negative
- Interference pattern is smeared: one peak for small b two peaks for large b

11

Light-front Wave Function I

- Consider pion-pion scattering
- The dominant Fock state: $|q\bar{q}\rangle$

 ξ : longitudinal momentum fraction of q \vec{k} : transverse momentum of q

$$\begin{split} |\psi_h(P,j,m_j)\rangle &= \sum_{s_q,s_{\bar{q}}} \int_0^1 \frac{\mathrm{d}\xi}{2\xi(1-\xi)} \int \frac{\mathrm{d}^2 \mathbf{k}}{(2\pi)^3} \underbrace{\psi_{s_q,s_{\bar{q}}/h}^{(m_j)}(\mathbf{k},\xi)} \quad \text{Wave function} \\ &\times \frac{1}{\sqrt{N_c}} \sum_{i=1}^{N_c} b_{s_q i}^{\dagger}(\xi P^+, \mathbf{k} + \xi \mathbf{P}) d_{s_{\bar{q}} i}^{\dagger}((1-\xi)P^+, -\mathbf{k} + (1-\xi)\mathbf{P}) |0\rangle \end{split}$$

Light-front Wave Function I

- Consider pion-pion scattering
- The dominant Fock state: $|q\bar{q}\rangle$

 ξ : longitudinal momentum fraction of q \vec{k} : transverse momentum of q

$$\begin{split} \psi_h(P,j,m_j) \rangle &= \sum_{s_q,s_{\bar{q}}} \int_0^1 \frac{\mathrm{d}\xi}{2\xi(1-\xi)} \int \frac{\mathrm{d}^2 \mathbf{k}}{(2\pi)^3} \psi_{s_q,s_{\bar{q}}/h}^{(m_j)}(\mathbf{k},\xi) \end{split} \text{ Wave function} \\ &\times \frac{1}{\sqrt{N_c}} \sum_{i=1}^{N_c} b_{s_q i}^{\dagger}(\xi P^+, \mathbf{k} + \xi \mathbf{P}) d_{s_{\bar{q}} i}^{\dagger}((1-\xi)P^+, -\mathbf{k} + (1-\xi)\mathbf{P}) |0\rangle \end{split}$$

• Fourier transform to coordinate space in the transverse plane

$$\begin{split} \tilde{\psi}_{s\bar{s}/h}(\mathbf{r},\xi) &= \sqrt{\xi(1-\xi)} \sum_{n.m.l} \psi_h(n,m,l,s,\bar{s}) \tilde{\phi}_{nm}(\sqrt{\xi(1-\xi)}\mathbf{r}) \chi_l(\xi) \\ \text{with} \quad \phi_{nm}(\mathbf{q}) &= \frac{1}{\kappa} \sqrt{\frac{4\pi n!}{(n+|m|)!}} \left(\frac{|\mathbf{q}|}{\kappa}\right)^{|m|} e^{-\frac{|\mathbf{q}|^2}{2\kappa^2}} L_n^{|m|}(\frac{|\mathbf{q}|^2}{\kappa^2}) e^{im\theta_q} , \quad \text{2d harmonic oscillator basis} \\ \chi_l(\xi;\alpha,\beta) &= \xi^{\frac{\beta}{2}}(1-\xi)^{\frac{\alpha}{2}} P_l^{(\alpha,\beta)}(2\xi-1) \sqrt{4\pi(2l+\alpha+\beta+1)} \sqrt{\frac{\Gamma(l+1)\Gamma(l+\alpha+\beta+1)}{\Gamma(l+\alpha+1)\Gamma(l+\beta+1)}} \\ \alpha &= \beta = 4m_q^2/\kappa^2 \end{split}$$

• Only two parameters: m_q and κ

Light-front Wave Function II

• By fitting the pion and rho masses,

 $m_q = 480 \text{ MeV}, \ \kappa = 610 \text{ MeV}$

Qian, Jia, Li, Vary, PRC 102, 055207(2020)

No free parameter in the calculation in this work.

Light-front Wave Function II

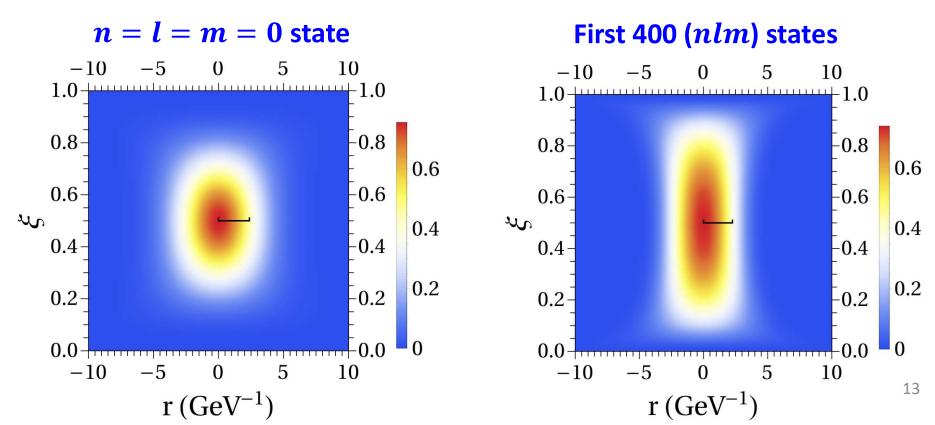

• By fitting the pion and rho masses,

 $m_q = 480$ MeV, $\kappa = 610$ MeV

Qian, Jia, Li, Vary, PRC 102, 055207(2020)

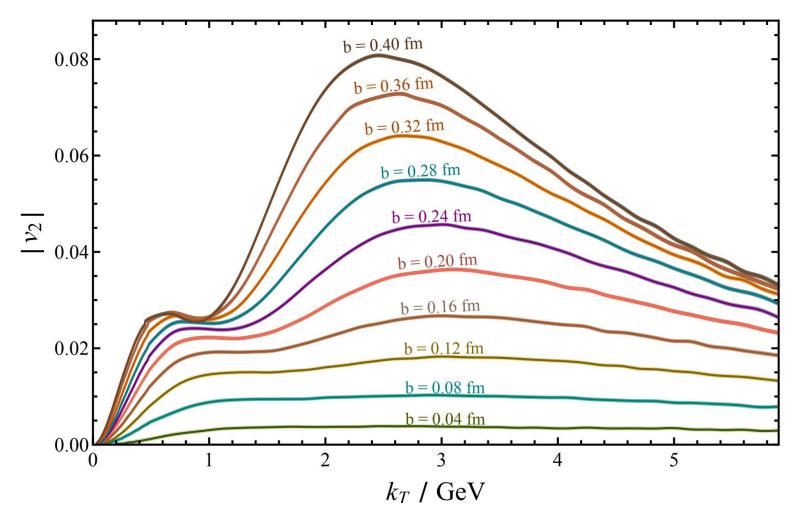

No free parameter in the calculation in this work.

• Probability density for q in a pion

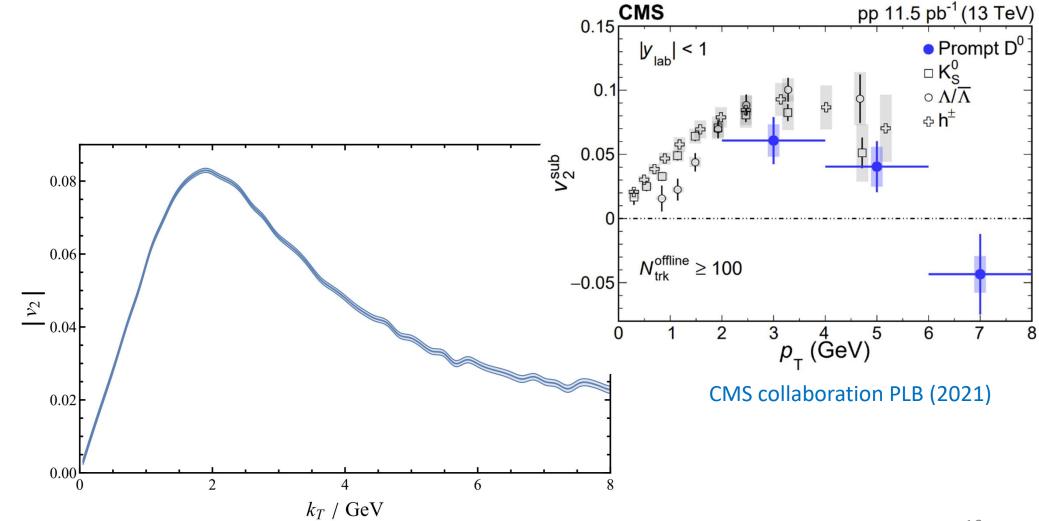

Pion-pion Scattering with b Fixed

- **Double-Peak structure** with $b \ge 0.1$ fm, residue of interference
- Interference effect is invisible with b < 0.1 fm

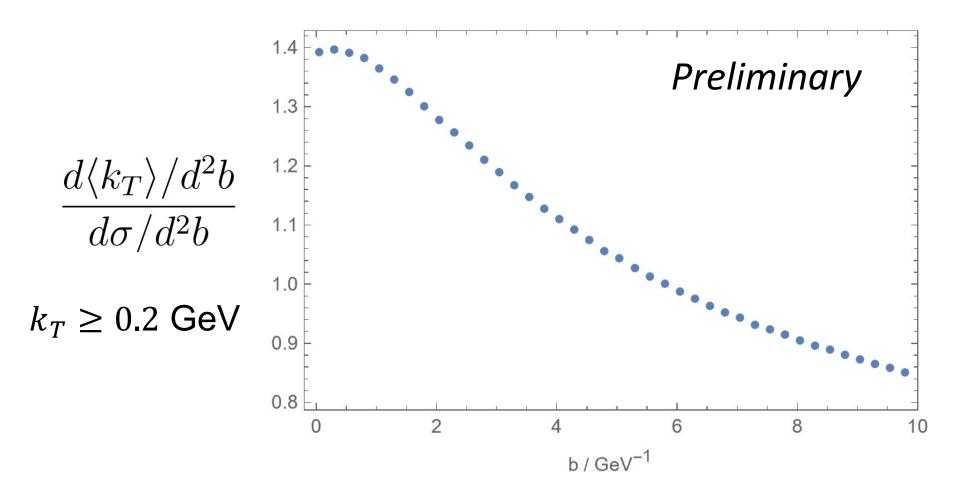

Pion-pion Scattering with *b*-integrated

- $d\sigma/db^2$ is dominant at small b
- Interference effect is invisible with b integrated

Select Events with Large b

• Events with large b tend to have smaller $\langle k_T \rangle$

• Events with small $\langle k_T \rangle$ may show double-peak structure in v_2

Summary

- We calculate the anisotropic flow v_2 in $\pi\pi$ collisions with eikonal approximation.
- The transition from single-parton scattering to multi-parton scattering is clearly visible in v_2 .
- With no free parameter, the obtained v_2 agrees qualitatively with data in pp collisions.
- The interference pattern is smeared after integrating over *b*.
 The double-peak structure may be revived by selecting events with small (*k_T*).
- Anisotropic flow can be applied in other processes to probe multi-parton correlation.

Х

Thank you!
