

Physics at CEPC

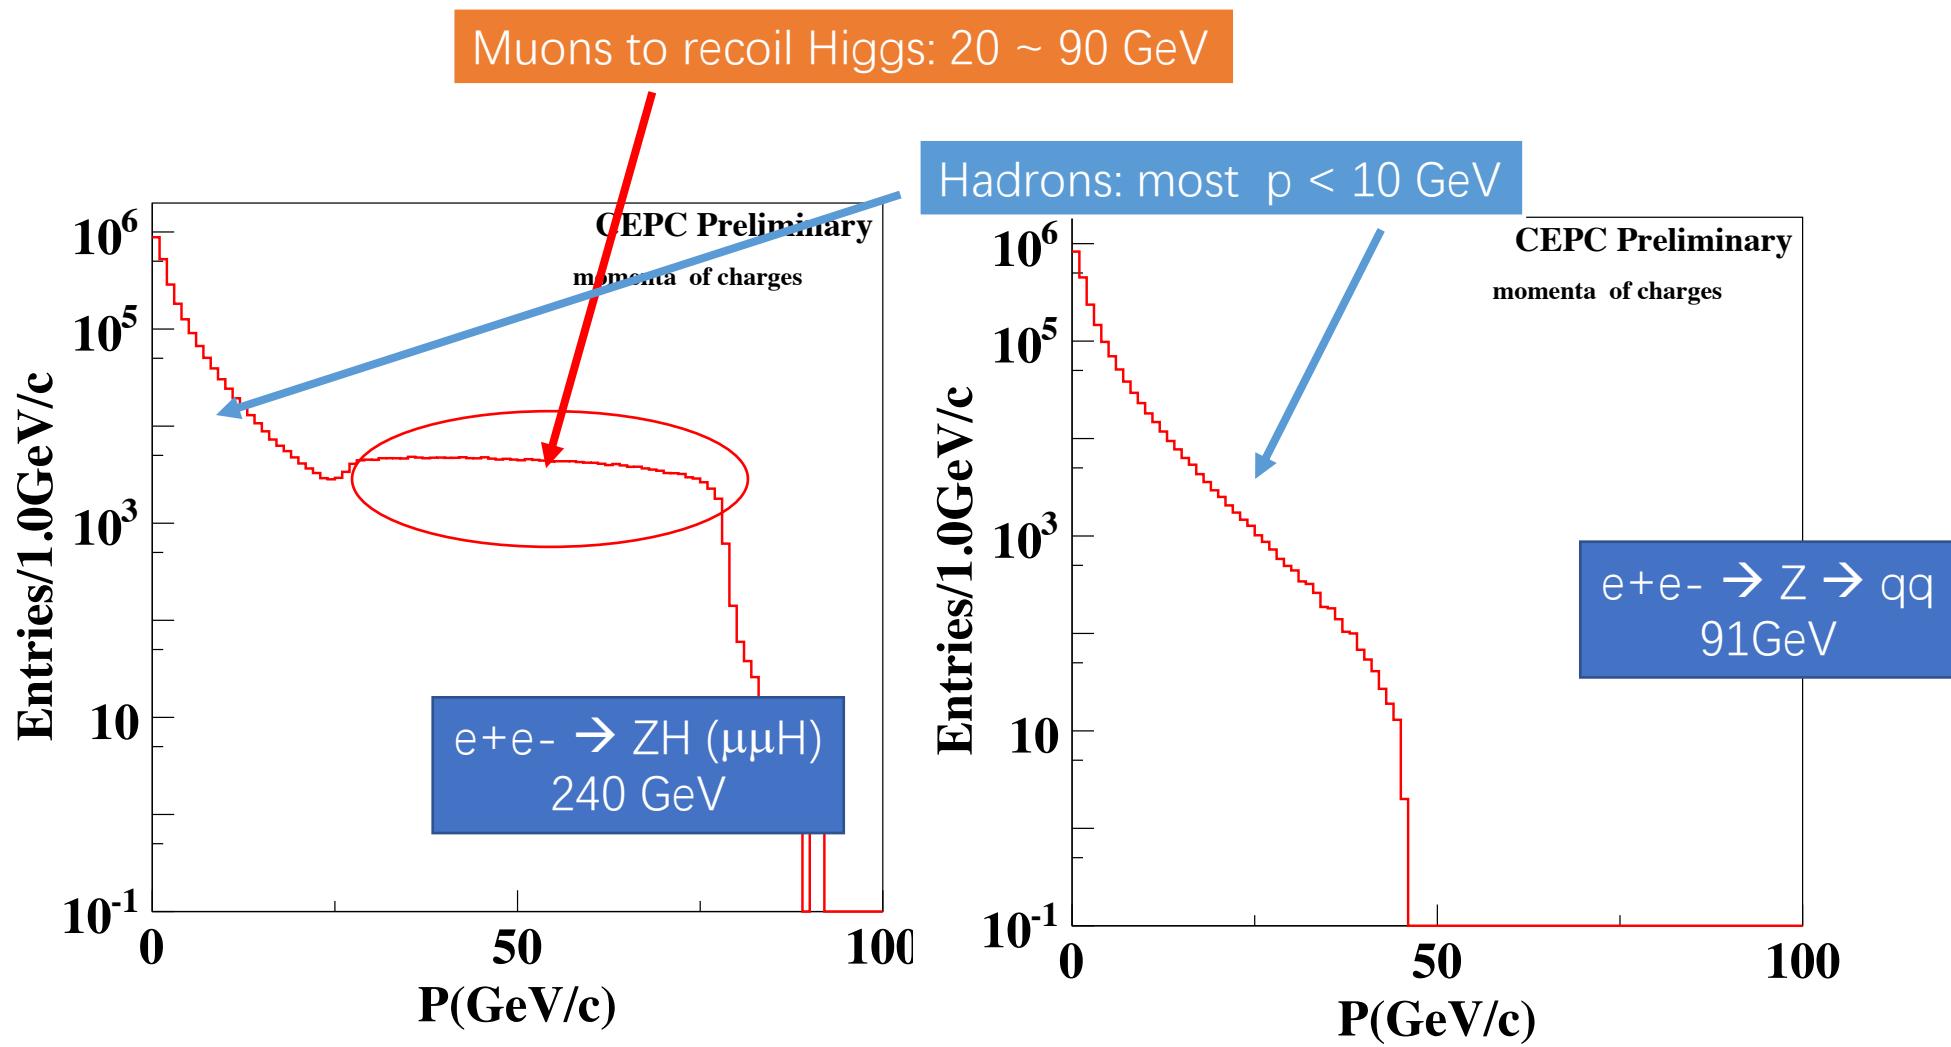

- Higgs @ 240 GeV
 - 4 fermion final states of interest
 - 2 fermion final state: the largest X-section $\sim 300 \times \sigma(ZH)$
- Z pole physics @ 91 GeV
 - 2 fermion final states dominant
 - Huge rate $\sim 1000 \times \sigma(240\text{GeV})$ and much higher lumi.
- W threshold ~ 160 GeV

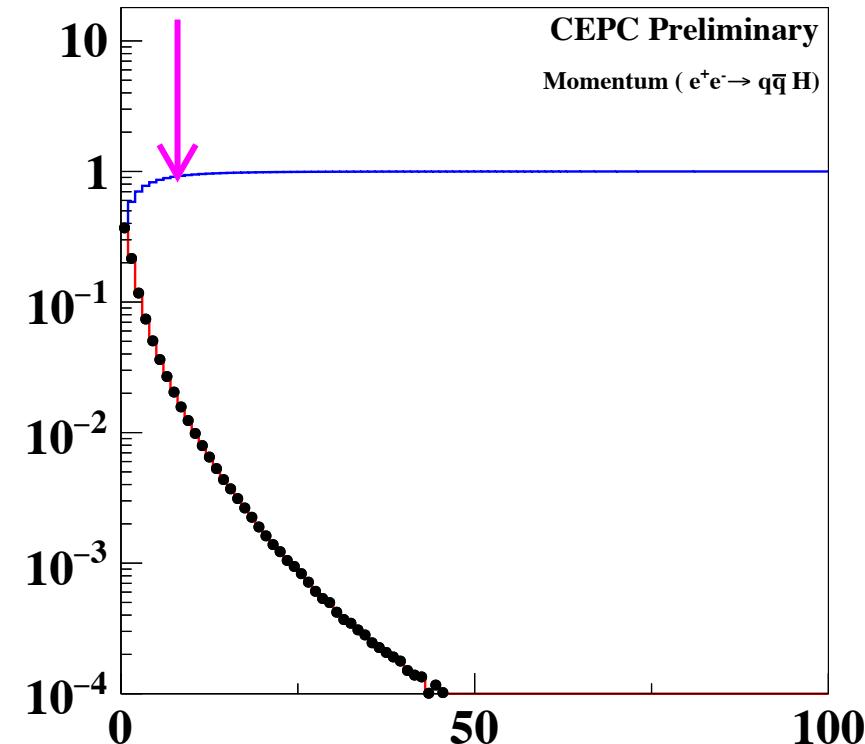

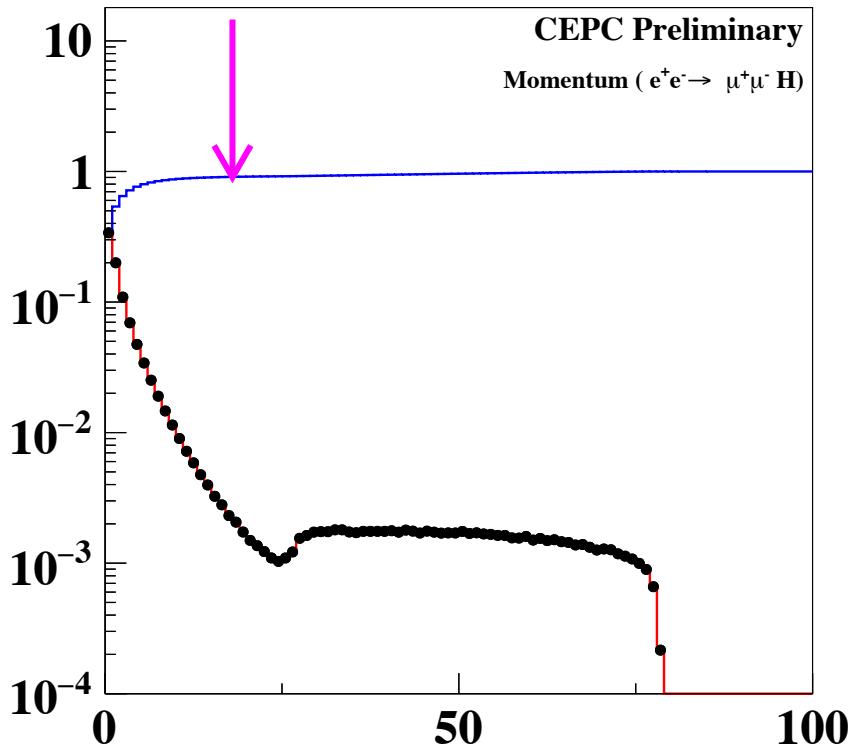

Number of tracks in a event

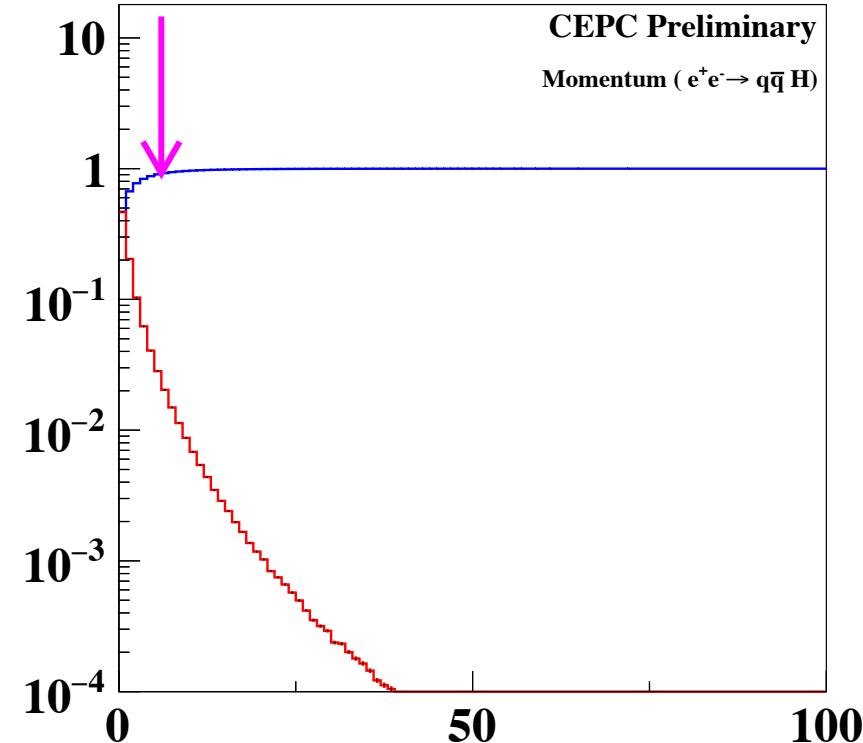

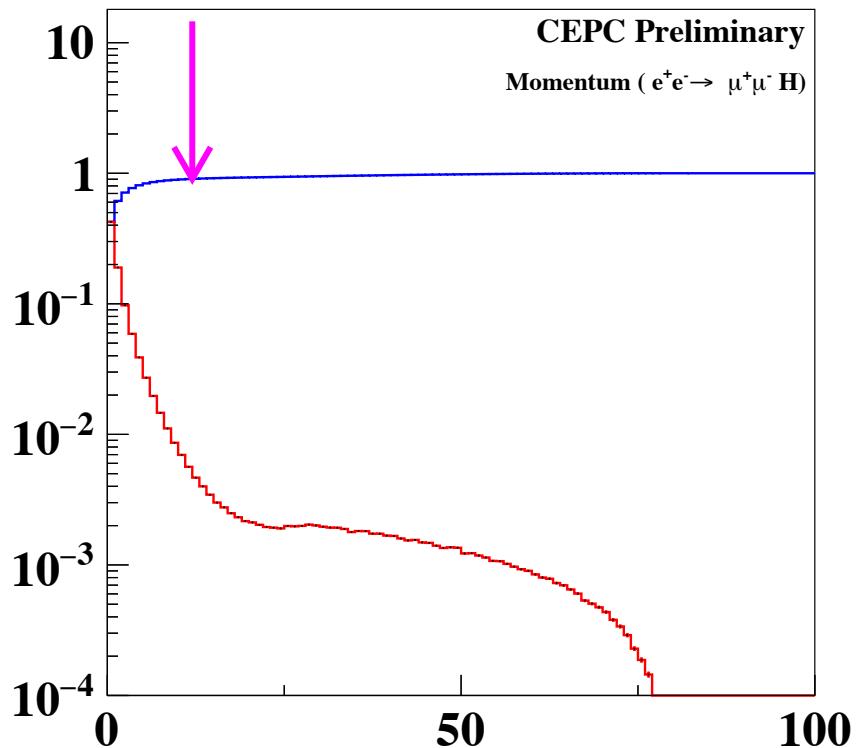

Momenta of tracks @ 240 & 91 GeV

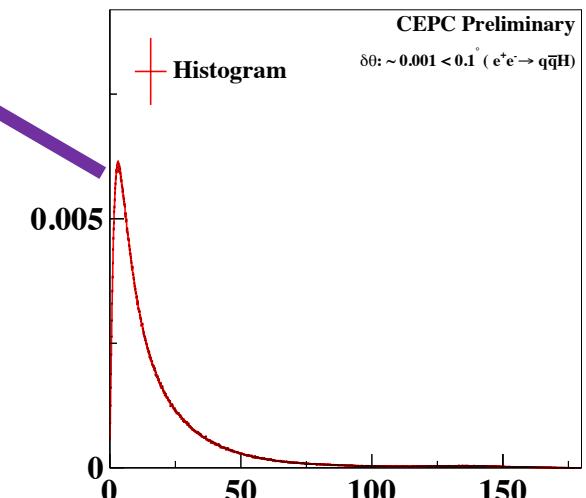

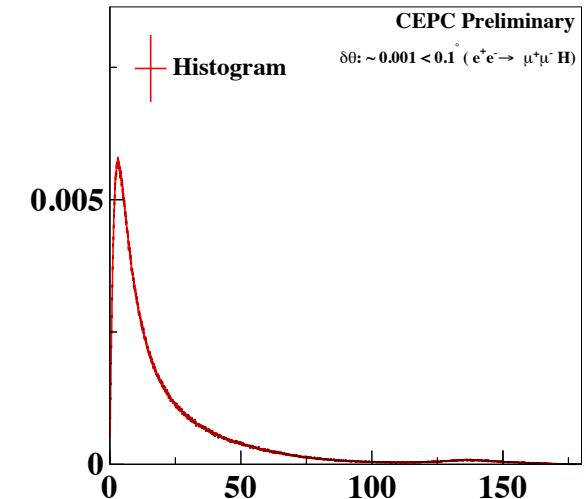

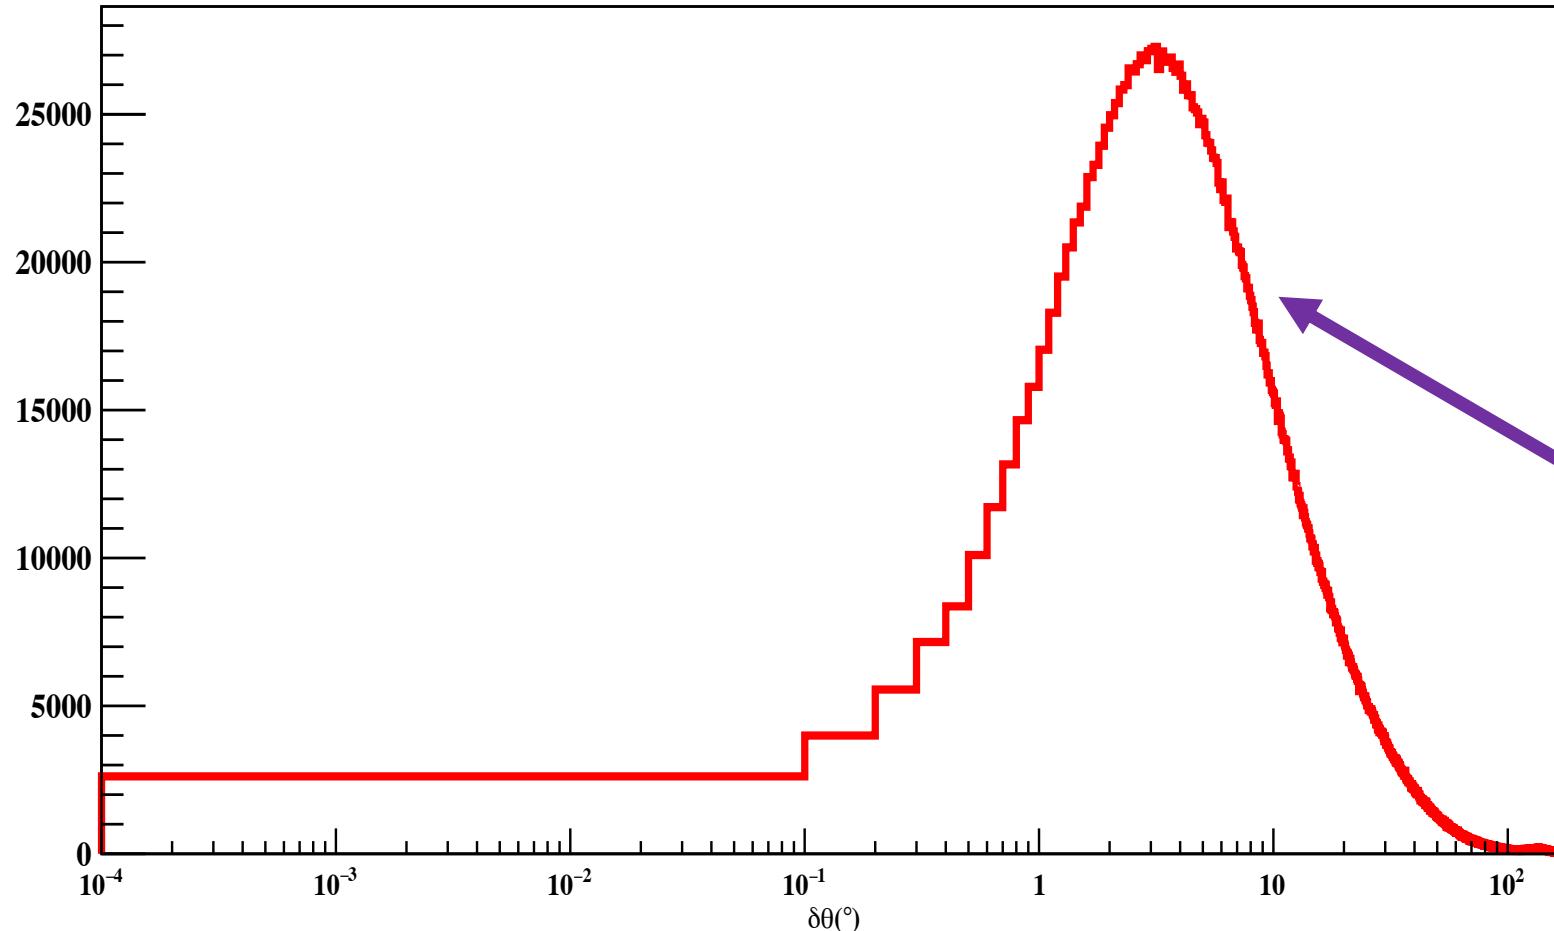

P of tracks 18(45), 8 (12) GeV for 90% (95%)

Pt of tracks
12(32), 6(9) GeV for 90% (95%)

Minimum angles between tracks

1st : Golden process: mu mu recoil

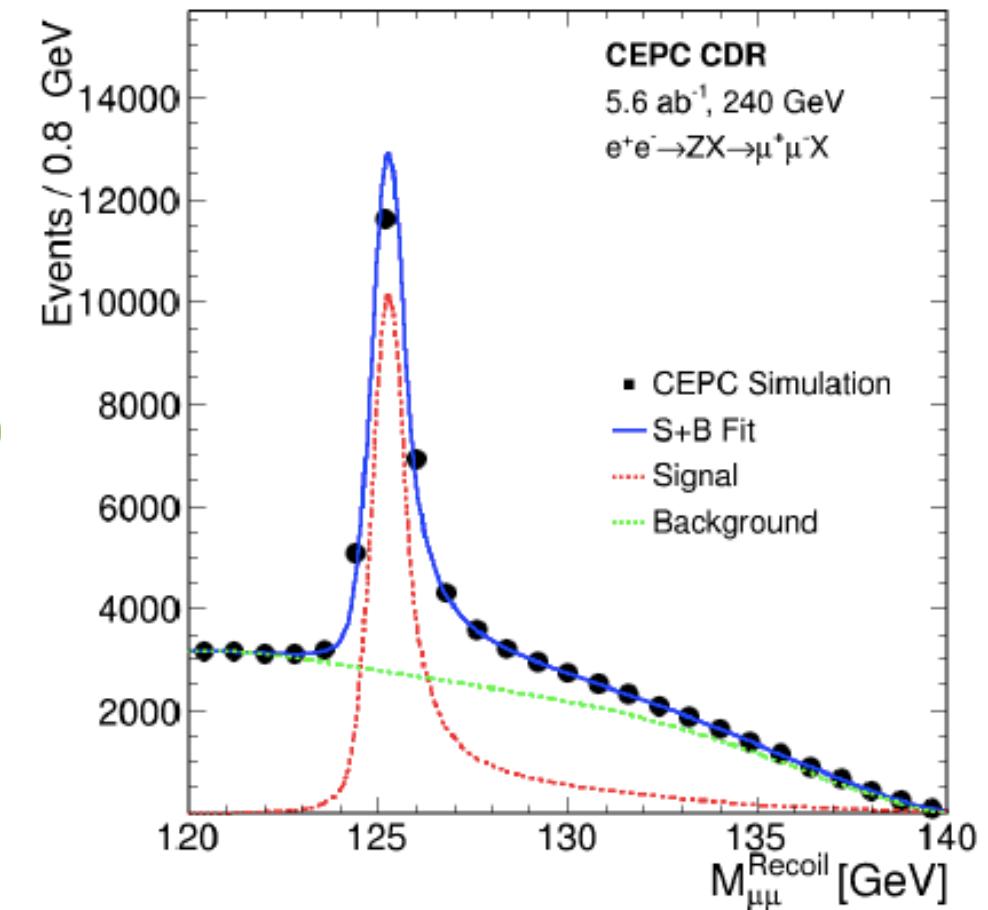

Typical mass resolution ~ 300 MeV (0.002 of 125 GeV)

$$M_{\text{recoil}}^2 = (\sqrt{s} - E_{ff})^2 - p_{ff}^2 = s - 2E_{ff}\sqrt{s} + m_{ff}^2$$

$$\Delta m_H = -\Delta m_{CM\mu^+} - \Delta m_{CM\mu^-} + \Delta m_{\mu^+\mu^-}$$

~ 200 MeV

$$\delta p/p \sim (0.001, 0.002) \rightarrow a \sim 2e-5, b \sim 0.001$$

2nd : jet energy resolution

Negligible, compared with typical calo resolution ~ 10%

3rd : flavor physics

Need more investigation

Remarks

- Processes of interest usually contain 4 fermions (leptons or quarks), whose average energy
 $240/4 (91/2) \sim 40\text{-}70 \text{ GeV}$
- Full hadronic decays (4 jets) : 95% of tracks has $\text{Pt} < 10 \text{ GeV}$
- Semi-Leptonic decays(2 leptons 2 jets): 95% of tracks has $\text{Pt} < 32 \text{ GeV}$
- Minimum angle between two tracks: $\text{MPV} \sim 3 \text{ degrees}$, 0.001 of tracks $< 0.1 \text{ degree}$
- Momentum range 20 – 90 GeV of special interest
- But low pt tracks dominant, whose significance need more investigation

Tracker Dimension (Barrel)

Components	Radius(mm)	Half Z (mm)	$\sigma_{R\phi}(\mu\text{m})$	$\sigma_z(\mu\text{m})$	Thickness($X_0 \%$)
Beam Pipe	10.35	-	-	-	0.172

Components	Inner radius(mm)	Outer radius (mm)	$\pm Z$ (mm)	$\sigma_U(\mu\text{m})$	$\sigma_V(\mu\text{m})$	Thickness(X_0 %)
FTD (7 pair of disks)	Depends on theta coverage	150/150/155/466/696/1018/1340/1820	205/305/466/696/1018/1340/2986			

- ✓ On charged tracks in region-of-interest (ROI), for Higgs and Z-pole respectively
 - full pT distribution of interesting processes
 - pT of 95% lower, upper and mid quantile
 - most probable value of pT, for optimising a, b in the resolution formula : **how to define it ?**
 - track multiplicity, i.e. number of tracks per event
- ✓ For tracks in jets, e.g. $e^+ e^- \rightarrow ZH$
 - number of tracks per jet
 - number of tracks per solid angle: **Need time to perform jet-clustering firstly**
 - distribution of minimum angle between tracks
