R. Tagami, T. Murata, W. Ootani, M. Ishino (ICEPP, UTokyo),
P. Wahlen (ETH/IP Paris/ILANCE UTokyo),
L. Gui (Imperial/Kyushu U.), T. Tanabe (MI-6 Ltd.)

Today's topics

All works done with **ILD full simulation** (plus FCCee Delphes for comparison)

Flavor tagging with Particle Transformer (ParT)

Big impact on Higgs studies
including **self coupling**
Strange tagging is also a scope

Particle flow with DNN

Key algorithm for particle flow detectors
Essential for detector optimization

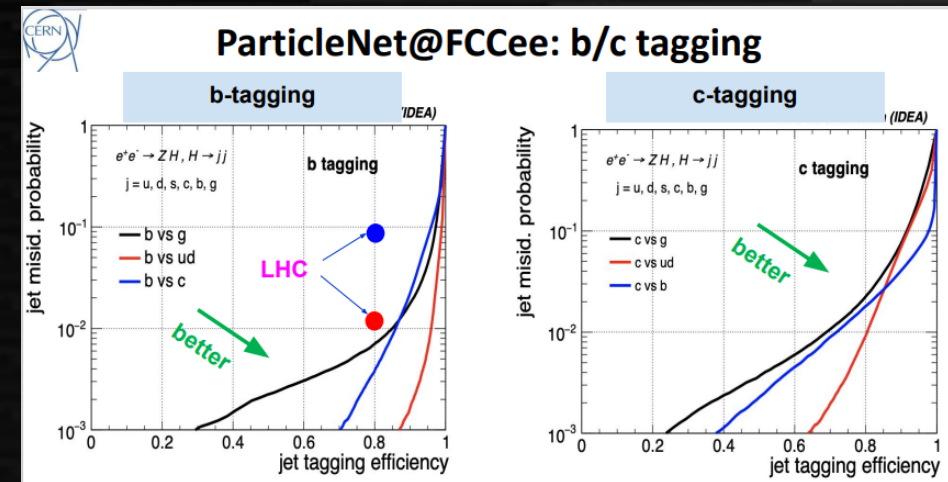

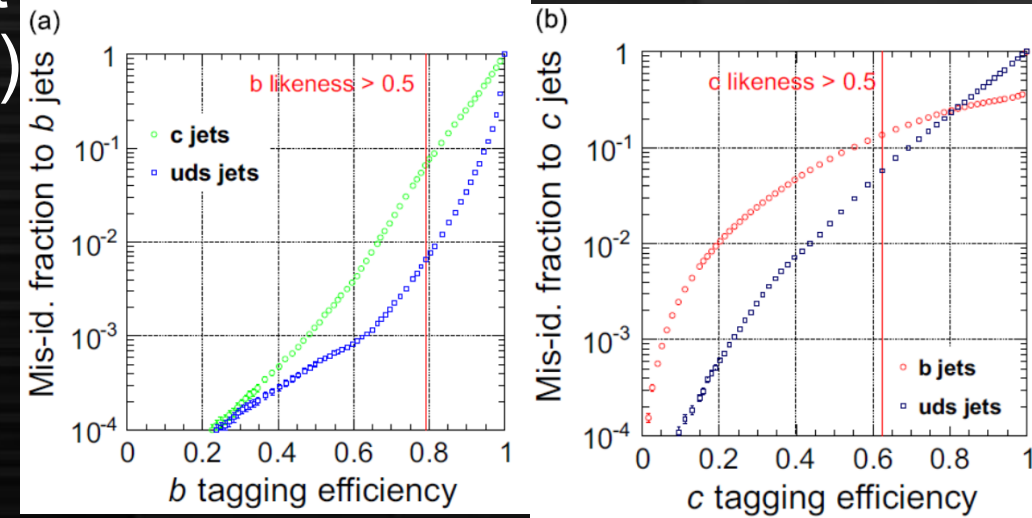

Flavor tagging with Particle Transformer (ParT)

Flavor tagging for Higgs factories

- Jet flavor tagging is essentially important for Higgs studies (including self coupling)
- **LCFIPlus** (published 2013) was long used for flavor tagging
 - All physics performance in ILD/SiD/CLIC are based on LCFIPlus
- FCCee reported $>10x$ better rejection using ParticleNet (GNN) in 2022
 - **Delphes** is used for simulation
- We studied DNN-based flavor tag with **ILD full simulation** to confirm it
 - Using latest algorithm: Particle Transformer (ParT)

LCFIPlus performance plots

Particle Transformer (ParT)

- Transformer: self-attention-based algorithm intensively used for NLP (e.g. chatGPT)
 - Weak biasing**: possible to train big samples efficiently (with more learnable weights) but demanding big training sample for high performance
- ParT is a new Transformer-based architecture for Jet tagging, published in 2022.
 - Pair-wise variable (angle, mass etc.) is added to plain Transformer encoder to boost attention
- Surpasses the performance of ParticleNet
 - ParticleNet only looks “neighbor” particles while Transformer uses attention to learn where to look

	All classes	
	Accuracy	AUC
PFN	0.772	0.9714
P-CNN	0.809	0.9789
ParticleNet	0.844	0.9849
ParT	0.861	0.9877

Performance with JetClass event classification (100M sample)

Data Samples and Input Variables

Data samples

- ILD full simulation
 1. $e^+ e^- \rightarrow qq$ (at 91 GeV) (used in LCFIPlus study)
 $q = b, c, u, d, s$
 $j = b, c, u, d, s, g$
 2. $e^+ e^- \rightarrow \nu\nu H \rightarrow \nu\nu jj$ (at 250 GeV) (2020 production)1M jets (500k events) for each flavor
- FCCee fast simulation (Delphes with IDEA detector):
 $e^+ e^- \rightarrow \nu\nu H \rightarrow \nu\nu jj$ (at 240 GeV)
10M jets (5M events) each flavor

80% for training
5% for validation
15% for test

Input variables

Particles: for every track/neutral

- Impact parameters (6)
 - 2D/3D, from primary vertex
- Jet distance (2)
 - Displacement from jet axis
- Covariant matrix (15)
- Kinematics (4)
 - Energy fraction, angles, charge
- Particle ID (6)
 - Probability (or binary selection) of $e, \mu, \text{hadron}, \text{gamma}, \text{neutral hadron}$

Interactions: for every particle pair

- $\delta R^2, k_t, Z, \text{mass}$

Input of ParT

Improvements wrt. LCFIPlus

- Factor (3-9) improvement at ParT from LCFIPlus without any tuning
- Another factor (max 3) improvement by tuning
 - Optimizing input variables
 - Separate embedding for tracks/neutrals

	b-tag 80% eff.		c-tag 50% eff.	
	c jets	uds jets	b jets	uds jets
background				
+LCFIPlus (BDT)	6.3%	0.79%	7.4%	1.2%
*ParT (initial)	1.3%	0.25%	1.0%	0.43%
**ParT (improved)	0.48%	0.14%	0.86%	0.34%

+LCFIPlus (BDT) 250 GeV nnqq

*ParT (initial) 91 GeV qq, default settings

**ParT (improved) 250 GeV nnqq, b/c/d separation

Comparison with FCCee results

1M: 800k jets for training

4/6/8M: 4/6/8M jets for training

Conditions

- FCCee data provided by M. Selvaggi (as ROOT files including input variables)
- Processed with our script (using weaver (by H. Qu) and based on provided configuration)

Results

- FCCee 1M gives ~2x better
 - Comparable with reduced inputs
- FCCee 4/6/8M gives **much better**
 - Sample size dependence needs to be investigated with ILD (maybe difficult with full simulation)
 - (JetClass has 100M events)

Sample / sample size	b-tag 80% eff.		c-tag 50% eff.	
	c jets	uds jets	b jets	uds jets
ILD full-sim 1M (optimized)	0.48%	0.14%	0.86%	0.34%
FCCee Delphes 1M (reduced)	0.47%	0.12%	0.64%	0.10%
FCCee Delphes 1M (full)	0.21%	0.054%	0.36%	0.059%
FCCee Delphes 4M	0.045%	0.025%	0.20%	0.033%
FCCee Delphes 6M	0.014%	0.010%	0.13%	0.022%
FCCee Delphes 8M	0.007%	0.006%	0.076%	0.021%

We see mild consistency between ILD and FCC!

FCCee configurations:

- Simulation: Delphes (IDEA geometry)
- Input: Kinematic/Impact parameter/Track error
/Particle ID (including TOF and dn/dx) (not with reduced)
- Slight difference with ILD variables (e.g. interaction)

Strange tagging

- High-momentum kaon in jet is a clue to strange jets
 - Contamination from $g \rightarrow ss$ give relatively low momentum
- dE/dx is essential for Particle ID in ILD
 - As well as ToF, but only effective in low energy tracks (which are less important in strange tagging)
- Using newly-developed **comprehensive PID**
 - Giving much better separation than previous PID

Fraction of true particles
True particle

	K	π	p	e	μ
K	0.65	0.04	0.20	0.04	0.10
π	0.08	0.90	0.04	0.32	0.28
p	0.26	0.04	0.76	0.09	0.08
e	0.00	0.00	0.00	0.53	0.01
μ	0.01	0.02	0.00	0.01	0.53

CPID prediction

$\uparrow 3 < p < 5 \text{ GeV}$

	K	π	p	e	μ
K	0.74	0.07	0.20	0.13	0.16
π	0.07	0.89	0.03	0.40	0.37
p	0.18	0.03	0.76	0.09	0.06
e	0.00	0.00	0.00	0.38	0.01
μ	0.01	0.01	0.00	0.01	0.40

$\uparrow p > 5 \text{ GeV}$

More Kaons in ss
More protons in gg

Fractions of tracks having > 5 GeV

Strange tagging: initial results

- First results obtained with CPID
 - No significant improvements from old PID: investigating
 - Compared with truth PID: some difference
 - FCC (1M) better than ILD Truth PID
 - Reason needs to be investigated (maybe non-perfect assignment of truth PID)
- Still needs study

	s-tag 80% eff.	
Method	g-bkg acceptance (%)	d-bkg acceptance (%)
ILD full sim. CPID	25.7	42.7
ILD full sim. Truth PID	23.2	38.0
FCC 1M (PID+tof)	20.3	29.6

Strange tagging performance

FCCee plot (in their study)

Flavor tagging: adapting ILCSoft/key4hep

- ParT trained in “weaver” framework
 - <https://github.com/hqucms/weaver-core>
 - Can operate ParT, ParticleNet and more
 - Accept ROOT trees, configuration to manipulate/select input as well as network structures
 - ONNX output feature available
- Onnx runner for flavor tagging implemented in LCFIPlus
 - Use same routines for output ROOT trees for training and input vectors for inference to feed into onnx network
 - Output should be added as PID in LCIO
 - Now at final tuning...hopefully available very soon (~1-2 weeks)

Flavor tagging: summary and plans

- Significantly better performance of flavor tagging with ParT
 - Implementation to the reconstruction framework foreseen to be applied to real physics analysis
 - Porting with Onnx framework available, performance currently degraded, under investigation
 - Further optimization still possible
- Strange tagging under investigation
 - Performance still needs to be understood more
 - To be fixed soon → to be used for physics analysis (e.g. $H \rightarrow ss$)
 - Dependence on PID performance to be investigated
 - Coming with various detector configurations

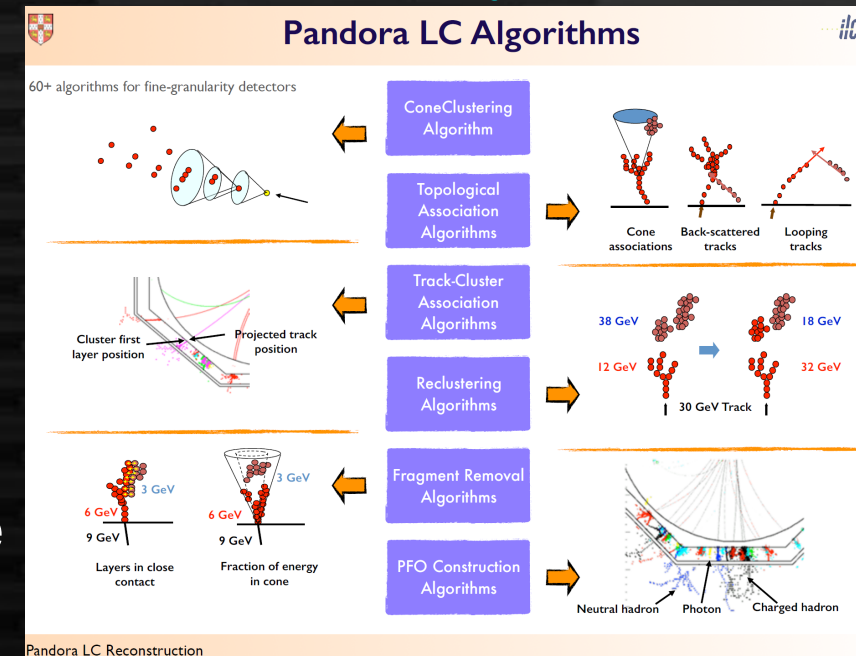

Particle flow with DNN

Particle flow in Higgs factories

- PandoraPFA is used since 2008 as standard for >15 years

- Good-old technology but fully tuned only minor modifications since 2008
- Exceeding PandoraPFA is a long-lasting target for development of PFA
 - Several algorithms gave challenge but no algorithm significantly exceeds the performance and thus not replaced

- Our primary target is to exceed PandoraPFA
 - In addition, DNN-based algorithm has many benefits
 - eg. Easier adaptation to geometries and additional features

GNN-based PFA

- Originally developed for CMS HGCAL
- **Input:** position/energy/timing of **each hit**
- **Output:** virtual coordinate and β for **each hit**

GravNet arXiv:1902.07987

- The virtual coordinate (S) is derived from input variables with simple MLP
- Convolution using “**distance**” at S (bigger convolution with nearer hits)
- Concatenate the output with MLP

Object Condensation (loss function)

$$L = L_p + s_c(L_\beta + L_V)$$

arXiv:2002.03605

- **Condensation point:** The hit with largest β at each (MC) cluster
- L_V : **Attractive potential** to the condensation point of the **same cluster** and **repulsive potential** to the condensation point of **different clusters**
- L_β : Pulling up β of the condensation point
- L_p : Regression to output features

What we implemented: track-cluster matching

- PFA is essentially a problem “to subtract hits from tracks”
- HGCAL algorithm does not utilize track information
 - Only calorimeter clustering exists

$$L = L_p + s_c(L_\beta + L_v)$$

- Putting tracks as “virtual hits”
 - Located at entry point of calorimeter
 - Having “track” flag (1=track, 0=hit)
 - Energy deposit = 0

L_v : attractive/repulsive potential to condensation points / tracks

L_β : Pulling up β of the condensation points / tracks

Tracks are prioritized over other condensation points

- Modification on object condensation to forcibly treat tracks as condensation points

Current number of parameters: ~420K

Clustering algorithm

- Output of the network is position and β of each hit \rightarrow need clustering
- Hits that are within a certain distance (**td**) from the highest β point assume as a cluster
- Continues clustering until all hits are clustered or β of remaining hits are below threshold (**tbeta**)
- **td/tbeta** are tunable parameters

Our samples for performance evaluation

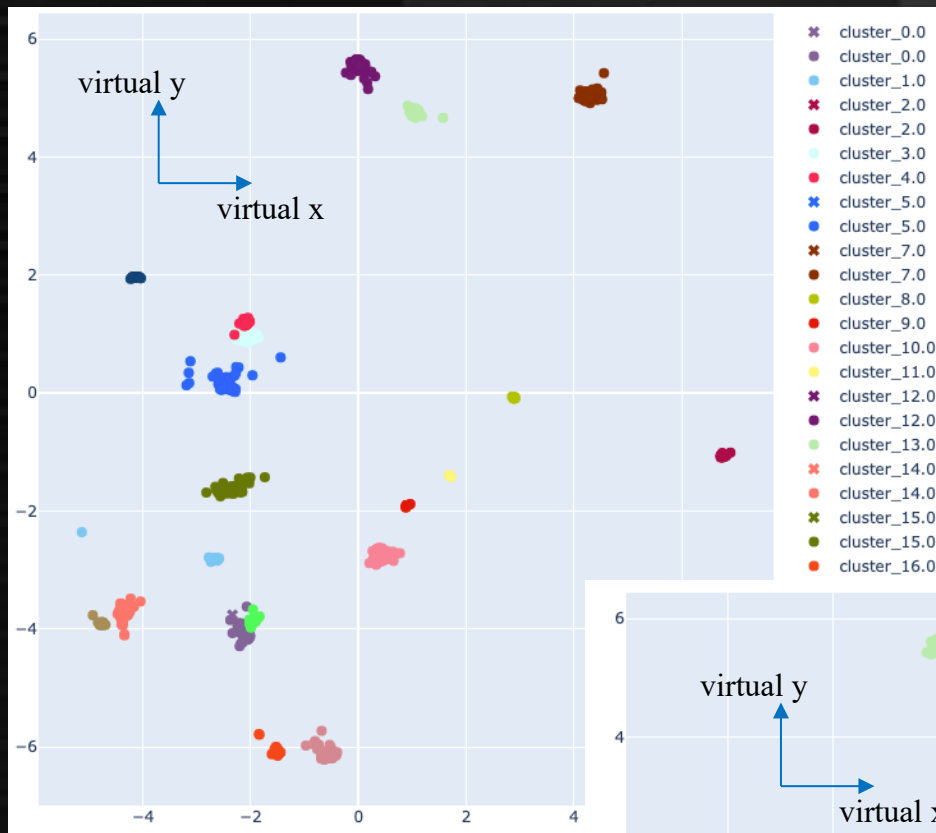

- ILD full simulation with SiW-ECAL and AHCAL
 - ECAL: $5 \times 5 \text{ mm}^2$, 30 layers, HCAL: $30 \times 30 \text{ mm}^2$, 48 layers
 - Taus overlaid with random direction
 - 100k events, 10 GeV x 10 taus / event \rightarrow 1 million taus
 - qq (q=u, d, s) sample at 91 GeV
 - ~75k events
 - Official sample for PFA calibration (other energies available)
 - Converted to awkward array stored in HDF5 format
 - A few 10 GB each

Taus: good mixture of hadrons, leptons and photons with some isolation
Good for training

Event display

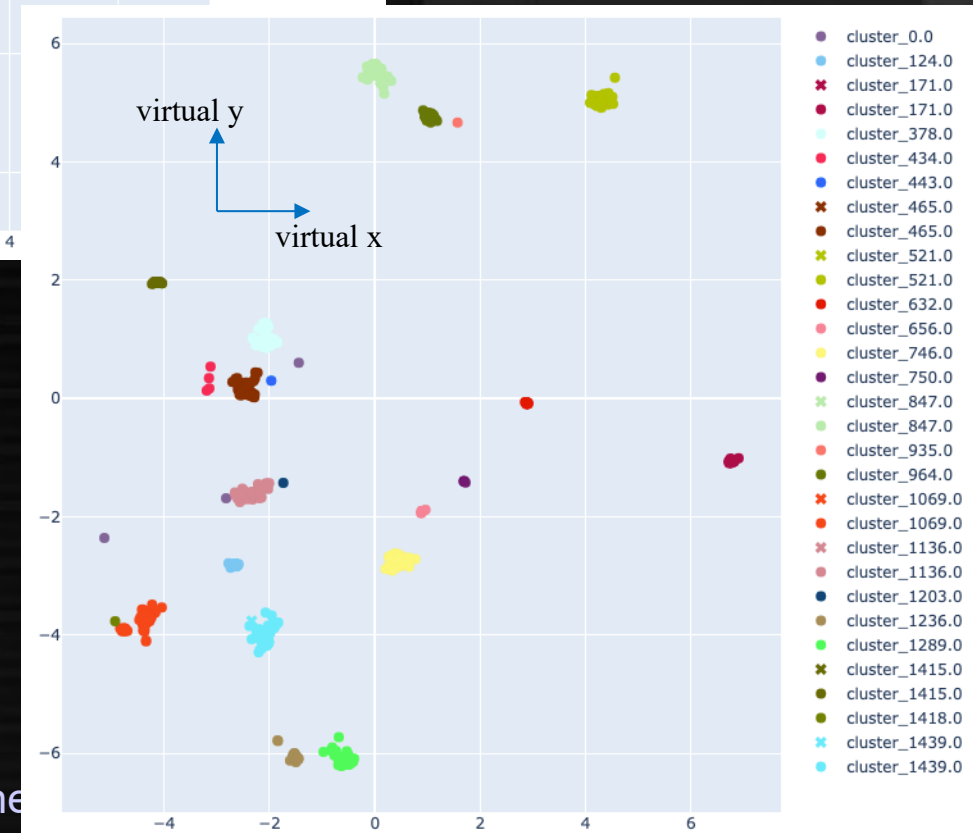

Input features
Real coordinate in detector
Colored by true clusters

Colored by true clusters

Output features
Virtual coordinate

Colored by reconstructed clusters

Quantitative evaluation

- Make 1-by-1 connection of MC and reconstructed cluster
 - Reconstructed cluster with highest fraction of hits from the MC is taken
 - Multiple reconstructed cluster may connect to one MC cluster
- Quantitative comparison with PandoraPFA
 - Compared “efficiency” and “purity” of particle flow
 - **Efficiency** : (reconstructed cluster energy that matches the MC cluster) / (MC cluster energy)
 - **Purity** : (reconstructed cluster energy that matches the MC cluster) / (reconstructed cluster energy)

Optimization of performance

Output dimension of the coordinate

- The initial work done with output coordinate dimension $D = 2$ (for visibility)
- Tried $D=3,4,8,16 \rightarrow D=4$ selected

Clustering parameters (td, tbeta)

- td: radius which hits are treated as coming from the same cluster
- tbeta: threshold of beta to form clusters

Scanning result: tbeta=0.1, td=0.3/0.4 selected

Results on efficiency and purity

Algorithm train/test	Electron eff.	Pion eff.	Photon eff.	Electron pur.	Pion pur.	Photon pur.
GravNet 10 taus/10 taus	99.1%	96.5%	99.0%	91.8%	98.9%	97.1%
PandoraPFA 10 taus	99.3%	94.0%	99.1%	91.8%	94.6%	97.2%
GravNet jets/jets	94.5%	93.1%	95.2%	77.4%	93.2%	92.4%
PandoraPFA jets	80.2%	90.4%	79.0%	75.0%	90.6%	77.7%
PandoraPFA jets (ILCSoft truth)	96.7%	95.5%	96.4%	97.1%	90.4%	97.7%

At least in our measure, performance of GravNet-based algorithm **exceeds PandoraPFA**
→ **Promising as full PFA (but energy regression to be done)**
Definition of MC truth clusters needs to be tuned (see ILCSoft truth)

More NLP-like model: transformer

Submitted to E1
in FY2025-26

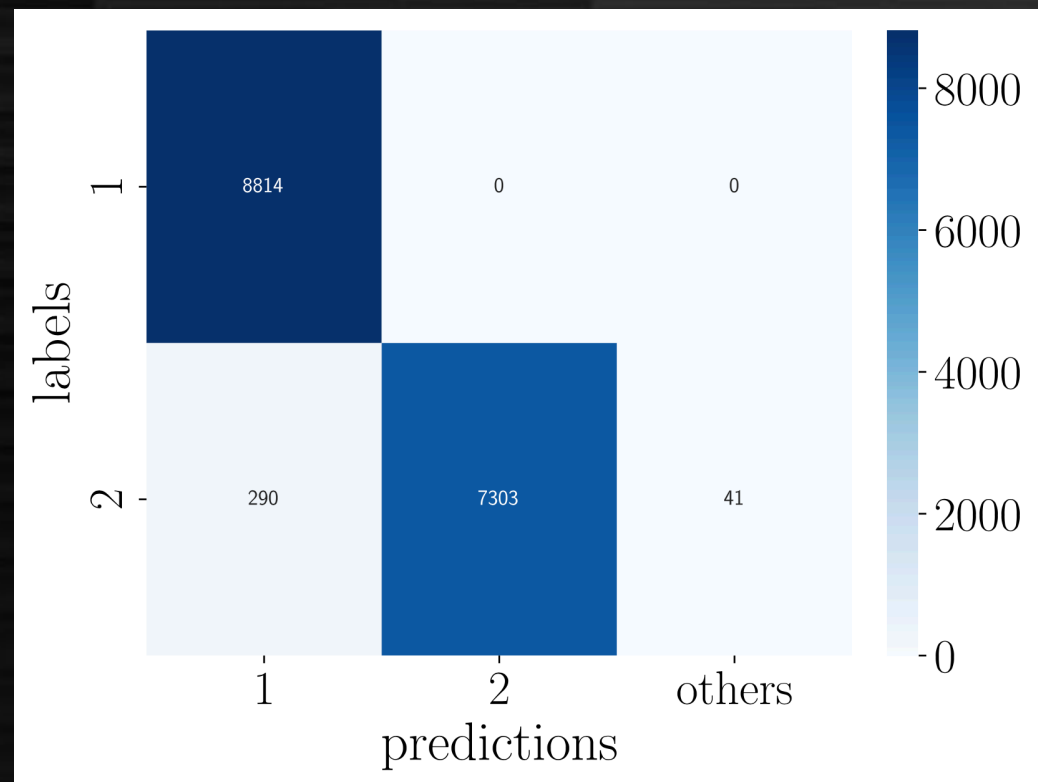

Transformer: training relation among elements (hits in PFA) with (multi-head) self-attention mechanism (used in GPT etc.)

Encoder: accumulate info of all hits/tracks by transformer

Decoder: Input cluster info one by one
Output info of next cluster (training) MC truth clusters (inference) just provide <bos> to derive first cluster, using output as next input until <eos> obtained (Inspired by translation NN)

Transformer-based PFA: some quick view

Separation of single and double photons
- random opening angle – not too bad
but worse than GNN-based study now

Proposal from collaborator: should investigate independent training of encoder part by e.g. masking some particles in each event (as often done in NLP)

Particle flow: summary and plans

First target achieved!

- GNN-based particle flow has possibility to replace PandoraPFA
 - Performance seems **significantly exceeded** at least in our measure
 - Difference on MC truth definition to ILCSoft to be investigated
 - (ILCSoft uses MCParticlesSkimmed while our method uses MCParticle collection)
- **Regression of cluster energy** being investigated
 - Necessary for complete PFA
 - Jet energy resolution would be compared with PandoraPFA
- Possible improvements
 - **Momenta of tracks** currently not used (improvements of clustering possible)
 - Incorporation of **timing information** etc.
- Another new idea to “ask network the next cluster” being tried
- Implementation to analysis: maybe not in the ECFA timescale...

Overall summary

- High level reconstruction @ ILD has a lot of room to incorporate with DNN to improve performance
 - Also easier to use for detector optimization
- Flavor tagging with ParT significantly better than LCFIPlus
 - To be applied to physics analysis
 - Strange tagging also under investigation
- Particle flow with GNN gives competitive performance
 - Energy regression to be done
 - Hope to replace PandoraPFA in ~a few years
 - NLP-like method also being investigated

Backup

Software for Particle Transformer

- Public in github, with instruction provided
 - https://github.com/jet-universe/particle_transformer
- Input: ROOT files for training (80%), validation (5%), test (15%)
 - Input variables can be provided via steering file (XML)
 - Input for each particle (tracks, neutral clusters)
 - Input for “interaction” → currently momentum only
 - Input for “coordinate” → theta/phi plan wrt. jet axis
- Output: ROOT files including evaluation results (likeness) for test events
 - To be analyzed with ROOT or so
- We implemented a processor (inside LCFIPlus) to produce ROOT files for input as much as compatible to FCCee variables
 - Except for PID values, which are not fully implemented
- Easy for testing, but not direct to be used for physics analyses

Training parameters - epochs

- Run on NVIDIA TITAN RTX (memory: 24 GB)
 - 20 Epochs: 3 hours
 - 200 Epochs: 30 hours
- No significant improvement in tagging efficiency
- Both ROC AUC score and Validation Metric reaches a maximum around 20 epochs.
- Overtraining after 20 epochs.
- Hence 20 epochs of training is selected to avoid overtraining.

20 epochs (ILD qq 91 GeV)

200 epochs (ILD qq 91 GeV)

Input Variables - Features

*Naming follows FCCee scheme – may not express exact meaning

- Impact Parameter (6):

- pfcand_dxy
- pfcand_dz
- pfcand_btagSip2dVal
- pfcand_btagSip2dSig
- pfcand_btagSip3dVal
- pfcand_btagSip3dSig

*d0/z0 and 2D/3D impact parameters, 0 for neutrals

- Jet Distance (2):

- pfcand_btagJetDistVal
- pfcand_btagJetDistSig

*Displacement of tracks from line passing IP with direction of jet
0 for neutrals

- Particle ID (6):

- pfcand_isMu
- pfcand_isEl
- pfcand_isChargedHad
- pfcand_isGamma
- pfcand_isNeutralHad
- pfcand_type

* Not including strange-tagging related variables (TOF, dE/dx etc.)

* Simple PID for ILD, not optimal

- Kinematic (4):

- pfcand_erep_log *Fraction of the particle energy wrt. jet energy (log is taken)
- pfcand_thetarel
- pfcand_phirel
- pfcand_charge

- Track Errors (15):

- pfcand_dptdpt
- pfcand_detadeta
- pfcand_dphidphi
- pfcand_dxydxy
- pfcand_dzdz
- pfcand_dxydz
- pfcand_dphidxy
- pfcand_dlambdadz
- pfcand_dxyc
- pfcand_dxycgttheta
- pfcand_phic
- pfcand_phidz
- pfcand_phictgtheta
- pfcand_cdz
- pfcand_cctgtheta

*each element of covariant matrix
0 for neutrals

Input Variables - Interactions

- FCC data uses p (scalar momentum) as interaction:
 - pfcand_p
- ILD data contains p_x, p_y, p_z (vector momentum) as interaction:
 - pfcand_px
 - pfcand_py
 - pfcand_pz
- But it's possible to transfer ILD's interaction to FCC's form for fair comparison:

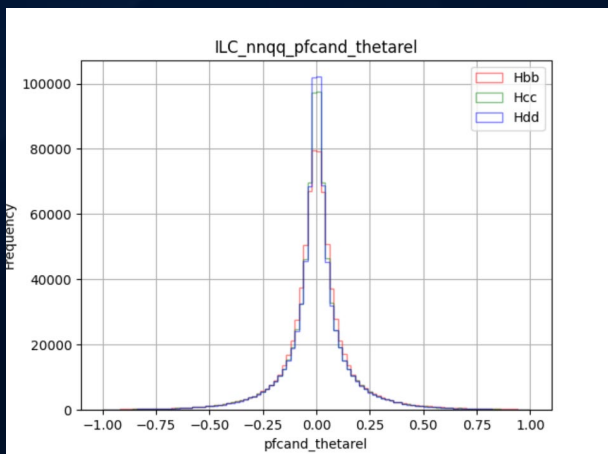

$$p = \sqrt{p_x^2 + p_y^2 + p_z^2}$$

Use p_x , p_y , p_z instead of p (Interaction)

				c-bkg acceptance @ b-tag 80% eff.		b-bkg acceptance @ c-tag 50% eff.	
Particle ID	Impact Parameters	Jet Distance	Track Errors	p	p_x p_y p_z	p	p_x p_y p_z
✗	●	●	●	0.62%	0.49%	1.14%	1.01%
✗	● +log(abs)	● +log(abs)	● +log(abs)	0.54%	0.52%	1.06%	1.00%
✗	● +log(abs)	●	●	0.47%	0.50%	1.03%	0.97%

- ILD (vvqq 250 GeV) data shows that application of p_x , p_y , p_z has better performance than p .
- However, application of $\log(\text{abs})$ of the parameters becomes less significant.
- Can be because that application of p_x , p_y , p_z changes the way $\log(\text{abs})$ interacts with other parameters.
- Other potential treatments can be investigated.

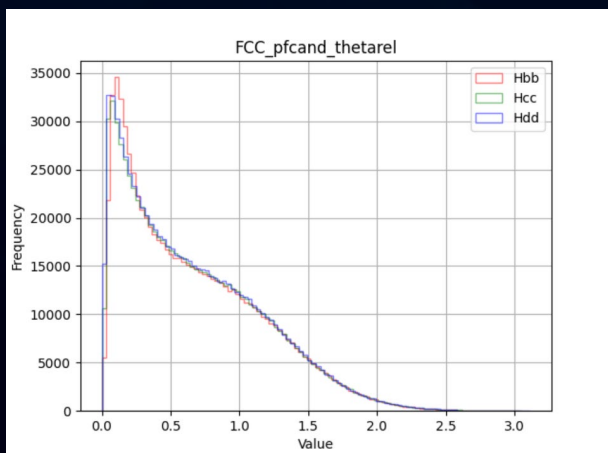

ILD vs. FCC – theta/phi distribution

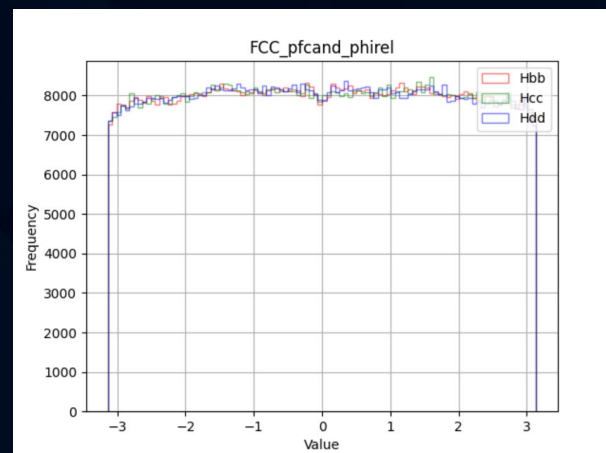

ILD theta

ILD phi

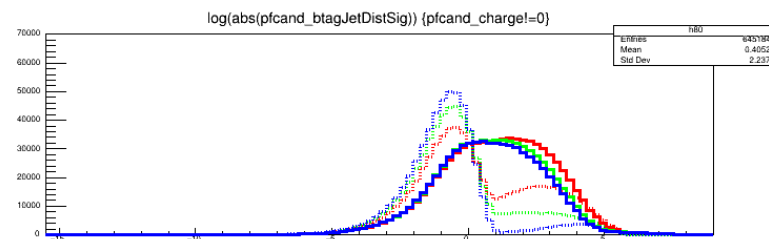

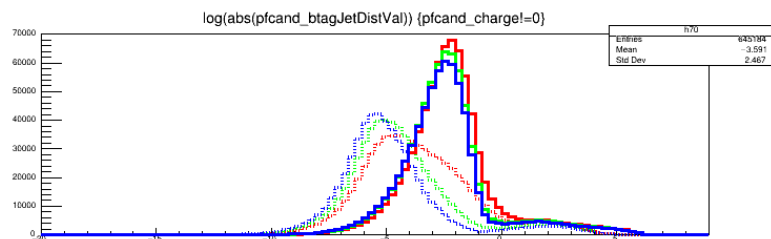

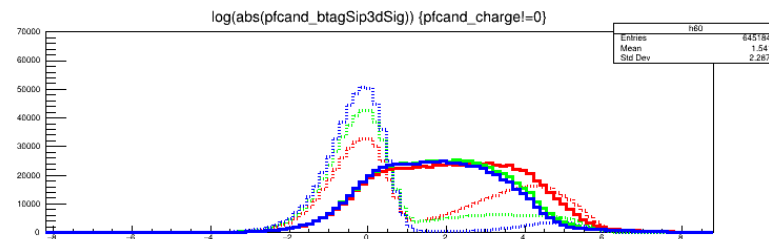

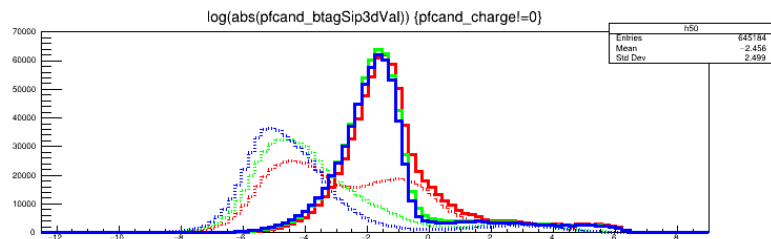

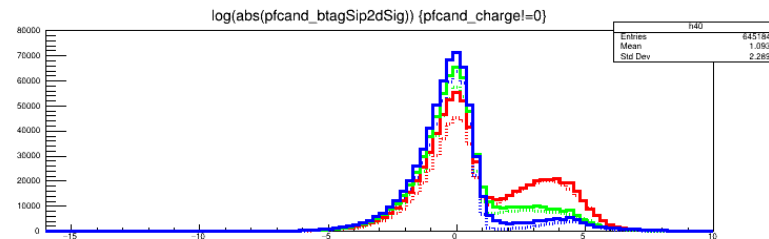

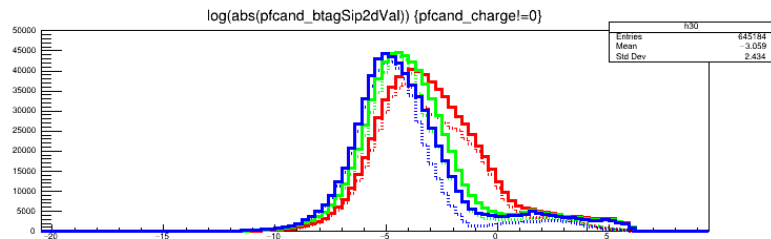

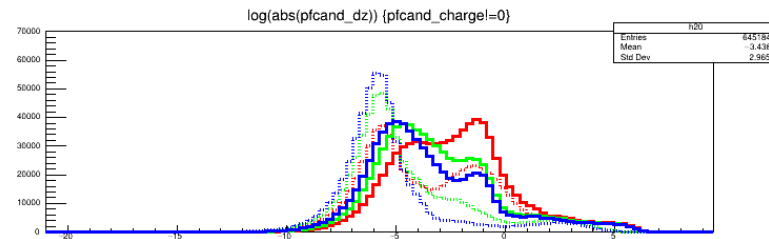

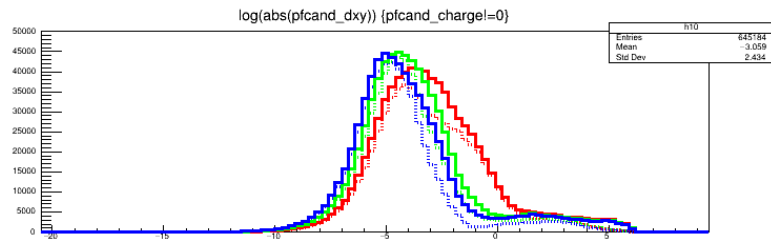

FCC theta

FCC phi

- ILD theta/phi are calculated from the difference between particle and jet theta/phi in the frame of the detector.
- FCC theta/phi are obtained from relative trace of the particle compared to the jet.
- This can cause some differences in the interaction of other parameters in the model.

Difference in impact parameters

Dotted – FCee
Solid – ILD

Red – nnbb
Green – nccc
Blue – nddd

Significant difference
on dz seen
- beam spot smearing?

Fine tuning

Two objectives

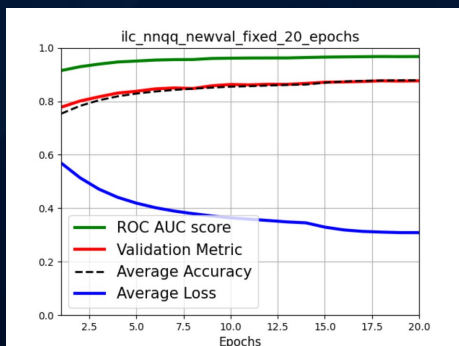

- Pretrained with fast sim and fine-tune with full sim
- Pretrained with large central production and fine-tune with dedicated physics samples in each analysis

							c-bkg acceptance @ b-tag 80% eff.		b-bkg acceptance @ c-tag 50% eff.	
Particle ID	Impact Parameters	Jet Distance	Track Errors	Fine-Tuning Sample	Training Sample	Similar theta/phi ?	No Fine-Tuning	With Fine-Tuning	No Fine-Tuning	With Fine-Tuning
✗	●	●	●	FCC 240 GeV (8M)	ILD 250 GeV (800k)	✗	0.62%	1.37%	1.14%	1.95%
✗	●	●	●	FCC 240 GeV (8M)	ILD 250 GeV (800k)	●	1.77%	1.32%	2.22%	2.01%
●	●	●	●	ILD 250 GeV (800k)	ILD 91 GeV (80k)	●	4.49%	0.97%	3.79%	1.53%

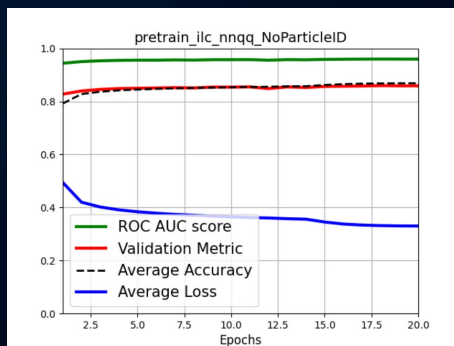

- Use result of 8M FCC data to train ILD 800k data
- Improves performance only when setups are similar
- Training of same setup (pretrain ILD 91 GeV data with ILD 250 GeV data) gives best performance
- Further investigation should be conducted on how to maximise the outcome for fine-tuning between different data sets

Fine tuning – Training curves

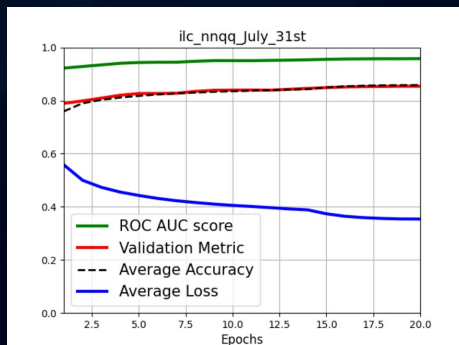

(1)

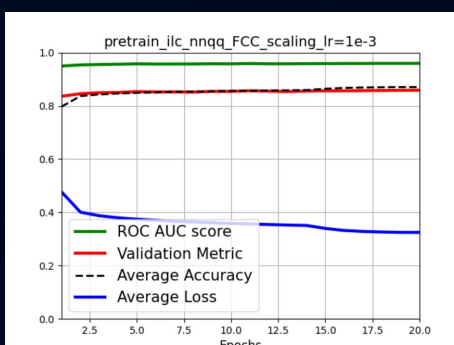

(2)

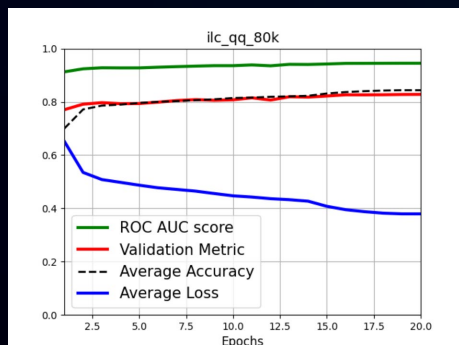

(3)

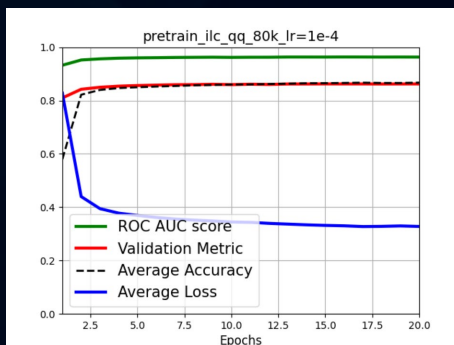

(4)

(5)

(6)

							Plot Indices	
Particle ID	Impact Parameters	Jet Distance	Track Errors	Fine-Tuning Sample	Training Sample	Similar theta/phi?	No Fine-Tuning	With Fine-Tuning
✗	●	●	●	FCC 240 GeV (8M)	ILD 250 GeV (800k)	✗	(1)	(2)
✗	●	●	●	FCC 240 GeV (8M)	ILD 250 GeV (800k)	●	(3)	(4)
●	●	●	●	ILD 250 GeV (800k)	ILD 91 GeV (80k)	●	(5)	(6)

- With fine-tuning, the training is obviously accelerated for the initial epochs (even for those with worse eventual performance)
- This is particularly obvious between plots (5) & (6) – similar simulation setup data

Multiple Training Runs

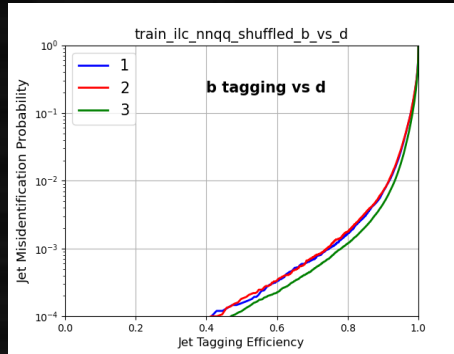

- Multiple training runs don't give significant impacts on results.
- The smaller data size is, the bigger impacts on results multiple runs give.
- The results of no Particle ID trainings varies more than those of with Particle ID.

data	Particle ID	b vs c 0.8 Score	variation
FCC 4M	○	4.82e-4	0.43e-4
FCC 8M	○	8.14e-5	1.58e-5
FCC 4M	×	1.69e-3	0.14e-3
FCC 8M	×	7.04e-4	3.49e-4

5 times training of FCC_8M data

Data Shuffled

- ILC nnqq dataset
 - 80% training, 5% validation, 15% test
- Shuffled the order of train/test/val making root files
 - Pattern 1: train/val/test
 - Pattern 2: val/train/test
 - Pattern 3: train/test/val

data	b vs c 0.8 score
Shuffle pattern 1	0.00647
Shuffle pattern 2	0.00734
Shuffle pattern 3	0.00338

Importing to ILD full simulation

- Prepare features from ILD full simulation
 - With recent versions (> v02-02)
- Input features: (x, y, z, edep)
- True cluster info from MCParticle and LCRelation
- Produced events
 - Two photons (5/10 GeV, fixed opening angles)
 - (n x) taus (5/10 GeV)
- Evaluation
 - Fraction of hits associated to the correct cluster (accuracy)

Example of a two-photon event (5 GeV, 30 mrad)

Average = 96.08%

Reasonable performance seen

accuracy

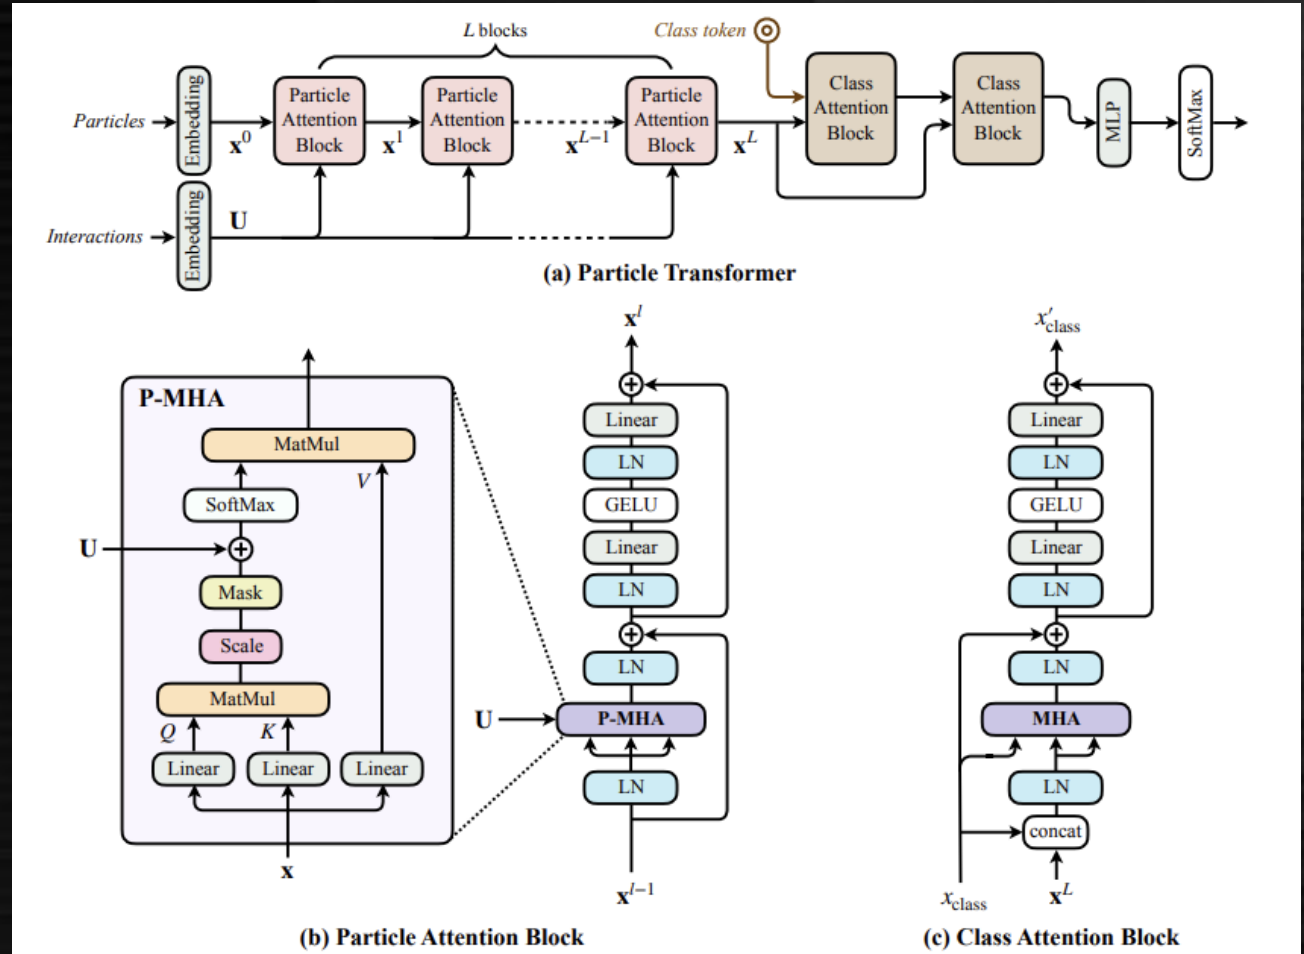

Angle[mrad]	30	60	90	120	150
Accuracy[%]	96.08	98.64	99.30	99.68	99.56

For details, refer eg. <https://indico.slac.stanford.edu/event/7467/contributions/5948/attachments/2887/8032/230517-lcws2023-hlreco-suehara.pdf>

Comparison between regular Transformer and Particle Transformer

Regular Transformer

(b) Particle Attention Block

(c) Class Attention Block

Particle Transformer

Note: MHA – MultiHeadAttention
P-MHA – Augmented version of MHA by Particle Transformer that involves Interactions Embeddings instead of Positional Embeddings

Progress in strange tag

	s vs c	s vs g	s vs u
0.8 efficiency	0.138	0.288	0.466

Current performance with ParT
(under investigation yet)

dE/dx inside strange jets (separated by MC PID)
