

ART25 (a recent global TMD fit)

After the conceptual improvements to transverse momentum dependent (TMD) extractions of a flavour dependent ansatz as well as a more robust propagation of uncertainties onto the resulting TMD functions in ART23, the following work ART25 is a state of the art determination of the unpolarised TMD parton distribution functions and -fragmentation functions such as the Collins-Soper kernel via a global fit on the available data.

With a simplistic model we achieve a good result for the fit and describe the data in the relevant phase space, provided by measurements of the semi-inclusive DIS and the Drell-Yan process.

In my talk I am going to review the framework of the extraction,
present the results of this work
and comment on aspects on which this type of fits can improve on.

Primary authors: Dr VLADIMIROV, Alexey (Universidad Complutense de Madrid); MOOS, Valentin (NYCU); Prof. SCIMEMI, Ignazio (Universidad Complutense de Madrid); Dr ZURITA, Pia (Universidad Complutense de Madrid)

Presenter: MOOS, Valentin (NYCU)

Session Classification: Parallel

Track Classification: Three-dimensional structure of the nucleon: transverse momentum dependent parton distributions
