

Study the variance of the mean logarithmic mass of cosmic rays in the knee region using LHAASO-KM2A

Saturday, 26 October 2024 14:40 (5 minutes)

Utilizing the unique advantages of the LHAASO experiment, we have achieved a high-precision measurement of the muon content generated by cosmic rays in the knee region of atmospheric showers. The first measurement of $\sigma_{\ln A}$ in the knee region using LHAASO-KM2A, combined with $\langle \ln(A) \rangle$, provides experimental evidence for major physical issues such as the origin of the knee region and the origin of cosmic rays.
