Introduction: vertex detector

- Vertex detector optimized for first 10 year of CEPC operation (ZH, low lumi-Z runs)
 - Low lumi Z runs is $\sim 20\%$ instant luminosity of high lumi Z runs
- Motivation:
 - Aim for impact parameter resolution and vertexing capability
 - For $H \rightarrow bb/ H \rightarrow cc/ H \rightarrow$ light quark or gluons analysis
 - The observation $H \rightarrow cc$ or $H \rightarrow gg$ is important goal for CEPC

Vertex Requirement

- Inner most layer (b-layer) need to be as close to beam pipe as possible
 - **Challenges:** b-layer radius (11mm) is smaller compared with ALICE ITS3 (18mm)
- High data rate: (especially at Z pole , ~43MHz, 1Gbps per chip)
 - **Challenges:** 1Gbps per chip high data rate especially at Z pole
- Low material budget (less than 0.15%X0 per layer)
- Detector Cooling with air cooling (power consumption \leq 40 mW/cm²)
- Spatial Resolution (3-5 um)
- Radiation level (~1Mrad per year in average)

Technology survey and our choices

- Baseline: based on curved CMOS MAPS (Inspired by ALICE ITS3 design[1])
 - Advantage: 2~3 times smaller material budget compared to alternative (ladder options)
