A SCHEMATIC MODEL OF BARYONS AND MESONS *

M. GELL-MANN California Institute of Technology, Pasadena, California

Received 4 January 1964

If we assume that the strong interactions of baryons and mesons are correctly described in terms of the broken "eightfold way" 1-3, we are tempted to look for some fundamental explanation of the situation. A highly promised approach is the purely dynamical "bootstrap" model for all the strongly interacting particles within which one may try to derive isotopic spin and strangeness conservation and broken eightfold symmetry from self-consistency alone ⁴). Of course, with only strong interactions, the orientation of the asymmetry in the unitary space cannot be specified; one hopes that in some way the selection of specific components of the Fspin by electromagnetism and the weak interactions determines the choice of isotopic spin and hypercharge directions.

ber $n_{t} - n_{\bar{t}}$ would be zero for all known baryons and mesons. The most interesting example of such a model is one in which the triplet has spin $\frac{1}{2}$ and z = -1, so that the four particles d⁻, s⁻, u⁰ and b⁰ exhibit a parallel with the leptons.

A simpler and more elegant scheme can be constructed if we allow non-integral values for the charges. We can dispense entirely with the basic baryon b if we assign to the triplet t the following properties: spin $\frac{1}{2}$, $z = -\frac{1}{3}$, and baryon number $\frac{1}{3}$. We then refer to the members $u^{\frac{2}{3}}$, $d^{-\frac{1}{3}}$, and $s^{-\frac{1}{3}}$ of the triplet as "quarks" \hat{U} q and the members of the anti-triplet as anti-quarks \bar{q} . Baryons can now be constructed from quarks by using the combinations (qqq), (qqqq \bar{q}), etc., while mesons are made out of (q \bar{q}), (qq $\bar{q}\bar{q}$), etc. It is assuming that the lowest

. . .

In general, we would expect that baryons are built not only from the product of three aces, AAA, but also from AAAAA, AAAAAAA, etc., where A denotes an anti-ace. Similarly, mesons could be formed from AA, AAAA etc. For the low mass mesons and baryons we will assume the simplest possibilities, AA and AAA, that is, "deuces and treys".

Theoretical interpretation

• $D_s \pi - DK$ coupled channel scattering: $T_{c\bar{s}}$ resonances is dynamically generated from the pseudoscalar-pseudoscalar meson interaction within the chiral unitary approach.

ZY Wang, YS Li and SQ Luo, Phys.Rev.D 111 (2025) 7, 076009

• Molecular $D_{s1}(2460)[D^*K, D_s^*\eta]$ state decay

Roca, Dias and Oset, arXiv:2502.18401

$$V_{K^+D^+,K^+D^+} = 0; \quad V_{\pi^+D_s^+,\pi^+D_s^+} = 0;$$
$$V_{K^+D^+,\pi^+D_s^+} = \frac{g^2}{m_{K^*}^2} (p_1 + p_3)_{\mu} (p_2 + p_4)^{\mu}.$$

Our model

• The feynman diagrams

• The amplitude

$$i\mathcal{M} = \frac{ir_{1}\epsilon \cdot p_{2}}{m_{13}^{2} - m_{f_{0}} + im_{f_{0}}\Gamma_{f_{0}}} + \left\{ \int \frac{ir_{2S}d^{4}q}{(2\pi)^{4}} \frac{\epsilon^{\mu}N_{\mu}(q, p_{0}, p_{1}, p_{2})(1 + G_{D_{s}\pi}(p_{\text{on}})T_{D_{s}\pi \to D_{s}\pi})(g_{K^{*}}, g_{D^{*}})}{[q^{2} - m_{D}^{2}][(q + p_{1})^{2} - m_{D^{*}}^{2}][(p_{0} - p_{1} - q)^{2} - m_{K}^{2}]} + (p_{1} \to p_{3}) \right\},$$

$$N_{\mu}(q, p_{0}, p_{1}, p_{2}) = (-g_{\mu\nu} + \frac{(p_{1} + q)_{\mu}(p_{1} + q)_{\nu}}{m_{D^{*}}^{2}})(p_{1} - q)_{\nu}(p_{2} - q + 2p_{3})_{\alpha}(-g_{\alpha\beta} + \frac{(p_{2} - q)_{\alpha}(p_{2} - q)_{\beta}}{m_{K^{*}}^{2}})(p_{2} + q)_{\beta}$$

Our model

• For the T-matrix,

$$T(\vec{k}_{D^*}, \vec{k}_{D^*}'; E) = \mathcal{V}(\vec{k}_{D^*}, \vec{k}_{D^*}'; E) + \int d\vec{q} \frac{\mathcal{V}(\vec{k}_{D^*}, \vec{q}; E) T(\vec{q}, \vec{k}_{D^*}'; E)}{E - \sqrt{m_D^2 + q^2} - \sqrt{m_{D^*}^2 + q^2} + i\epsilon}$$

$$V_{DK \to D_{S}\pi}^{K^{*}} = \frac{g_{K^{*}}}{m_{K^{*}}^{2}} (p_{1} + p_{3})_{\mu} (p_{2} + p_{4})^{\mu} \qquad \qquad \frac{K^{+}}{D^{+}} \qquad \frac{\pi^{+}}{M_{K^{*}}^{*0}}$$

Similar for $V_{DK \to D_s \pi}^{D^*}$. The resulting effective potential reads

$$\mathcal{V}_{\alpha\beta} = \left(V_{\alpha\beta}^{K^*} + V_{\alpha\beta}^{D^*}\right) \left(\frac{\Lambda_{\alpha}^2}{\Lambda_{\alpha}^2 + p_{\alpha}^2}\right)^2 \left(\frac{\Lambda_{\beta}^2}{\Lambda_{\beta}^2 + p_{\beta}^{\prime 2}}\right)^2$$

 $\alpha, \beta = 1,2$ for $D_s \pi$ and *DK* channel, respectively. The cutoff for these two

channels can be different.

Fit to the experimental lineshapes

 $\chi^2/dof = 1.5$

TABLE I. The parameters of the model determined from the fit and the pole position $(E_p = M - \Gamma/2i)$. The coupling constant g_{K^*} and g_{D^*} are in unit of GeV^2 , while the others are in units of GeV.

Phys.Rev.Lett. 128,112001(2022)

	$P(car{s})[\%]$	ours	exp
$D_{s0}^{*}(2317)$	$32.0^{+5.2}_{-3.9}$	$2338.9^{+2.1}_{-2.7}$	2317.8 ± 0.5
$D_{s1}^{*}(2460)$	$52.4^{+5.1}_{-3.8}$	$2459.4^{+2.9}_{-3.0}$	2459.5 ± 0.6
$D_{s1}^{*}(2536)$	$98.2\substack{+0.1\-0.2}$	$2536.6\substack{+0.3 \\ -0.5}$	2535.11 ± 0.06
$D_{s2}^{*}(2573)$	$95.9^{+1.0}_{-1.5}$	$2570.2^{+0.4}_{-0.8}$	2569.1 ± 0.8

$D_{s1}(2460)$

• Both the bare $c\bar{s}$ core and molecular components are significant and essential.

$D_{s1}(2536)$

• Mainly pure $c\bar{s}$.

The coupling of D_{s1} to D^*K can be obtained from the residue of the T-matrix:

$$g_i^2 = \frac{r}{2\pi} \int_0^{2\pi} T_{ii}(z(\theta)) e^{i\theta} d\theta \longrightarrow \left| \frac{g_S^{D_{s1}(2536)}}{g_D^{D_{s1}(2536)}} \right|_{theory} = 0.7.$$

The coupling can also obtained using the experimental branching fractions:

Particle Data Group

$$B(D^{*+}K^0)_{S-wave} = 0.61 \quad B(D^{*+}K^0)_{D-wave} = 0.24$$

$$\mathcal{M}_{S}^{i} = g_{S}^{i} \epsilon_{i}^{\mu} \epsilon_{j,\mu}^{\dagger}, \quad \mathcal{M}_{D}^{i} = \frac{g_{D}^{i}}{M^{2}} \epsilon_{i}^{\mu} \epsilon_{j}^{\dagger\nu} \left(q_{\mu} q_{\nu} - \frac{g_{\mu\nu} q^{2}}{4} \right) \qquad \longrightarrow \qquad \left| \frac{g_{S}^{D_{s1}(2536)}}{g_{D}^{D_{s1}(2536)}} \right|_{\exp} = 0.6$$

Estimate the lineshape for $D_{s1}(2536)$ decay

- Total 1 and Total 2 are for two choice of the phase for the tree diagram.
- No peak structure in the case of Total 2.

- The $T_{c\bar{s}}$ lineshape can be discribed through $D_s\pi DK$ coupled-channel interactions, revealing how off-diagonal potential terms generate the observed resonance pole;
- Predictive calculations for $D_{s1}(2536)$ decays using structural parameters derived from our prior analysis.
