- Apply optimal cut with maximum efficiency times purity
- Cut optimization method in Reference improves K efficiency a lot (**0.11**), improves K purity a little (**0.01**) at $(\cos\theta, p) = (0.3, 12\text{GeV})$
 - Release version: CEPCSW_tdr24.10.0
 - Samples: single $\pi/K/p$ samples at $p(12\text{GeV})$ and $\theta(72^\circ)$, 20000 events generated by ParticleGun

Optimal cut with maximum efficiency times purity

Ideal weighted $\chi_{TPC}(i \rightarrow K)$ distribution

cut optimization

❖ Cut optimization at $(\cos\theta, p) = (0.3, 12\text{GeV})$

- Maximize efficiency times purity for $\chi_{TPC}(i \rightarrow K)$ distribution to select K
- R is $(dN/dx)_{\text{meas}}$, R_K is $(dN/dx)_{\text{exp}}^K$, σ is $\sigma_{(dN/dx)_{\text{meas}}}$, $\pi: K: p = (10: 3: 1)$
- Maximum point at $-1.7 < \chi_{TPC}(K) < 1.4$, corresponding K efficiency is **0.874**, K purity is **0.775**, K efficiency improves a lot (+0.11), K purity improves a little (+0.01)
- If we choose the minimum χ^2 to select K , K efficiency is **0.765**, K purity is **0.765**
