

Trk, Vtx, PID

C.Zhang/09Dec2024

- For secondary vertex
 - 10k particle-gun K-short, $p_T=2\text{GeV}$,
 $\theta = 85^\circ, \phi = 0^\circ$
 - 70% $K_S^0 \rightarrow \pi^+ \pi^-$ events
 - Displaced vertices were reconstructed
 - The poor precision is suspected to be due to the smaller number of hit for long distance decays

Particle-gun muon pair from (x, 0, 50)

phi=0~60, theta=80~90

Vtx

Layer	R(mm)	muon pair x position
		0, 10
VXD-L1	12.5~18	
		23
VXD-L2	28~35	
		40
VXD-L3	45~53	
		150
ITK-L1	240	
		300
ITK-L2	350	
		450
ITK-L3	570	
TPC	600-1800	
		700
OTK	~1800	

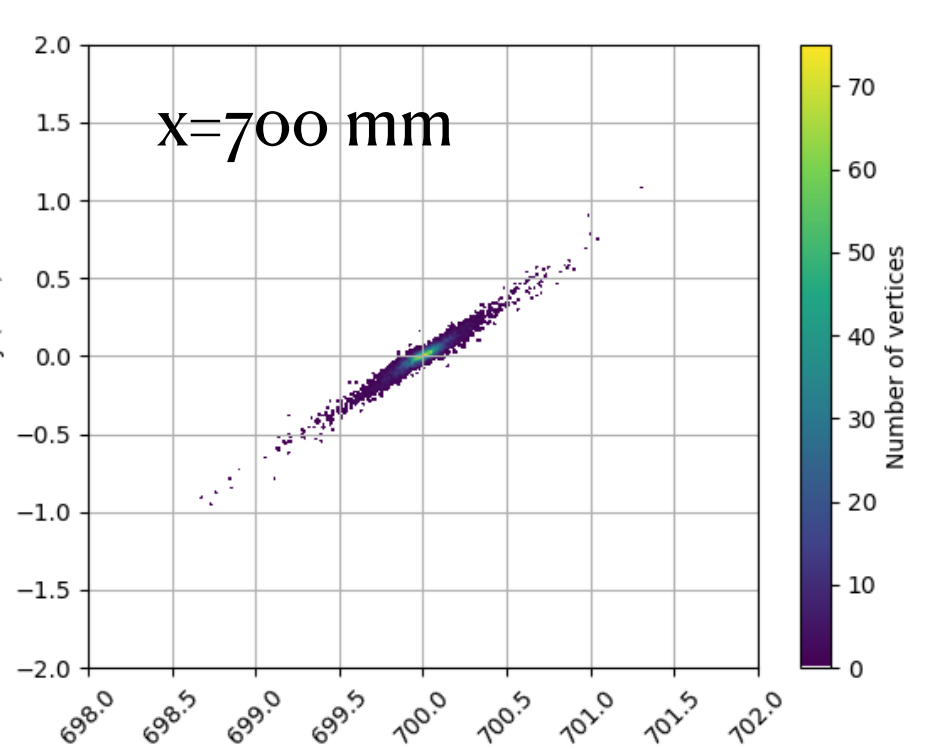

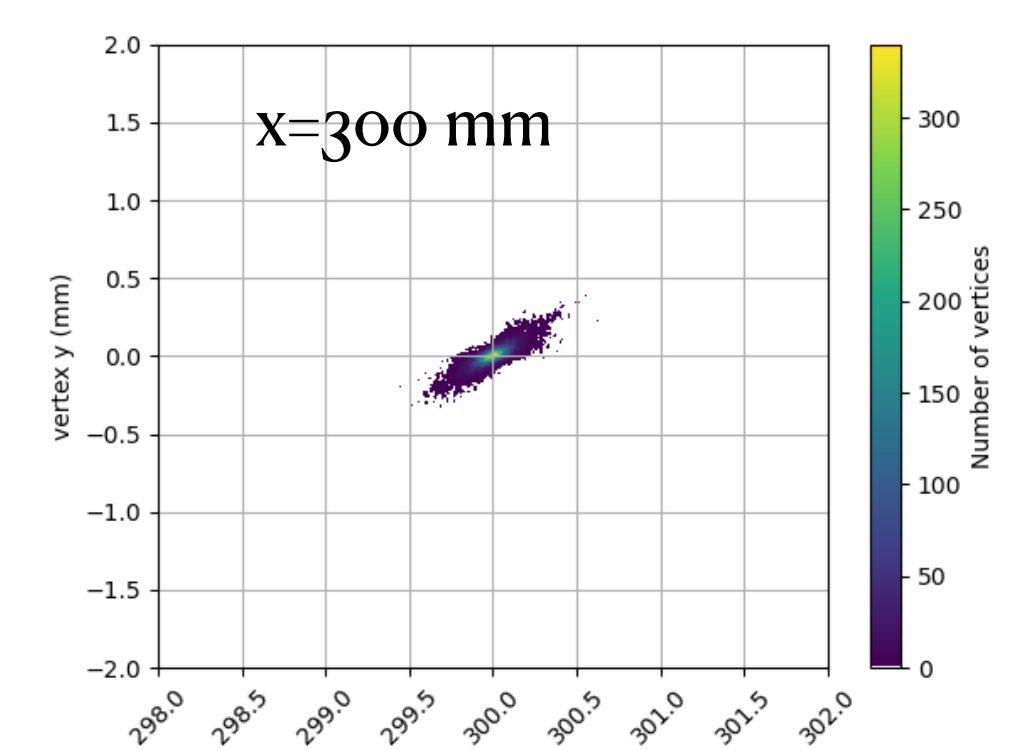

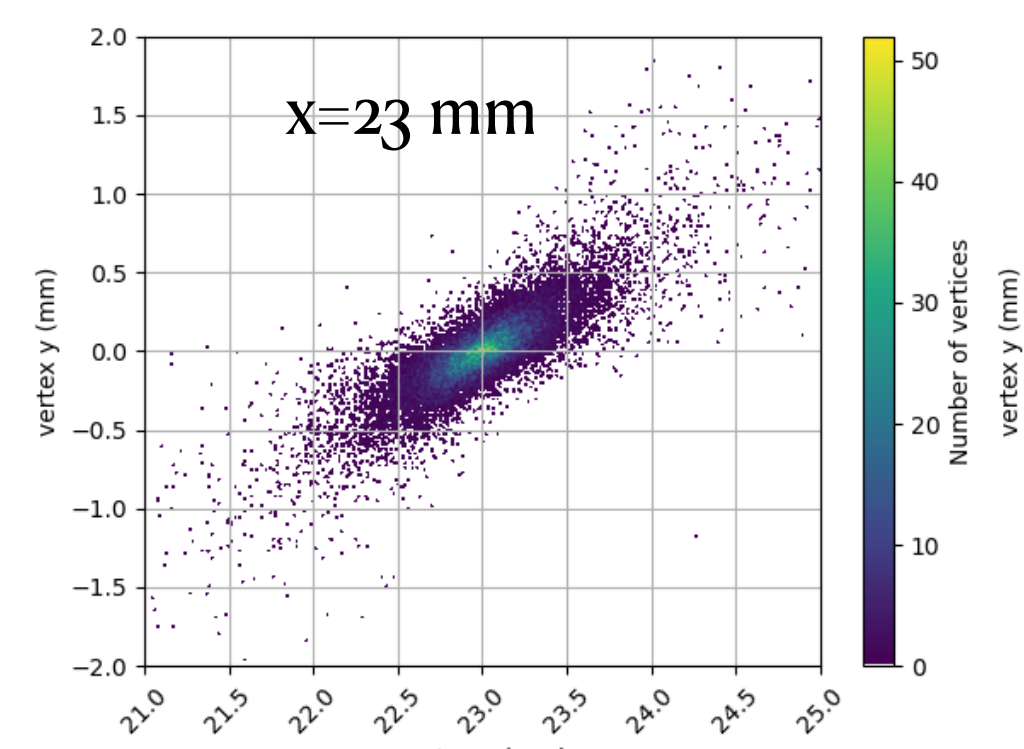

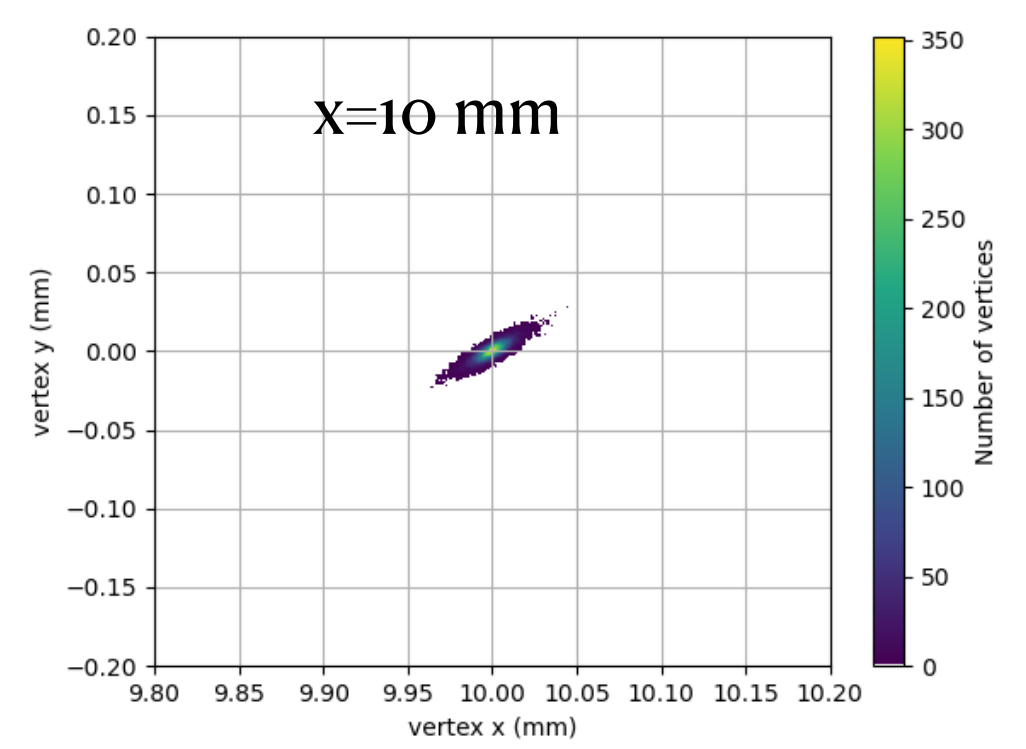

- d_0 and vertex have the same order of precision variation with position
- From $x=10$ to $x=23$, the precision decreases too rapidly
- $x=300$ is better than $x=150$ because it is closer to the corresponding first hit than $x=150$ (to adjust particle-gun position)
- If muon pair originates at $x=700$, TPC more likely to return a single track. Htrk=2 applied, note its normalisation

Particle-gun muon pair from (x, 0, 50)

phi=0~60, theta=80~90

Vtx

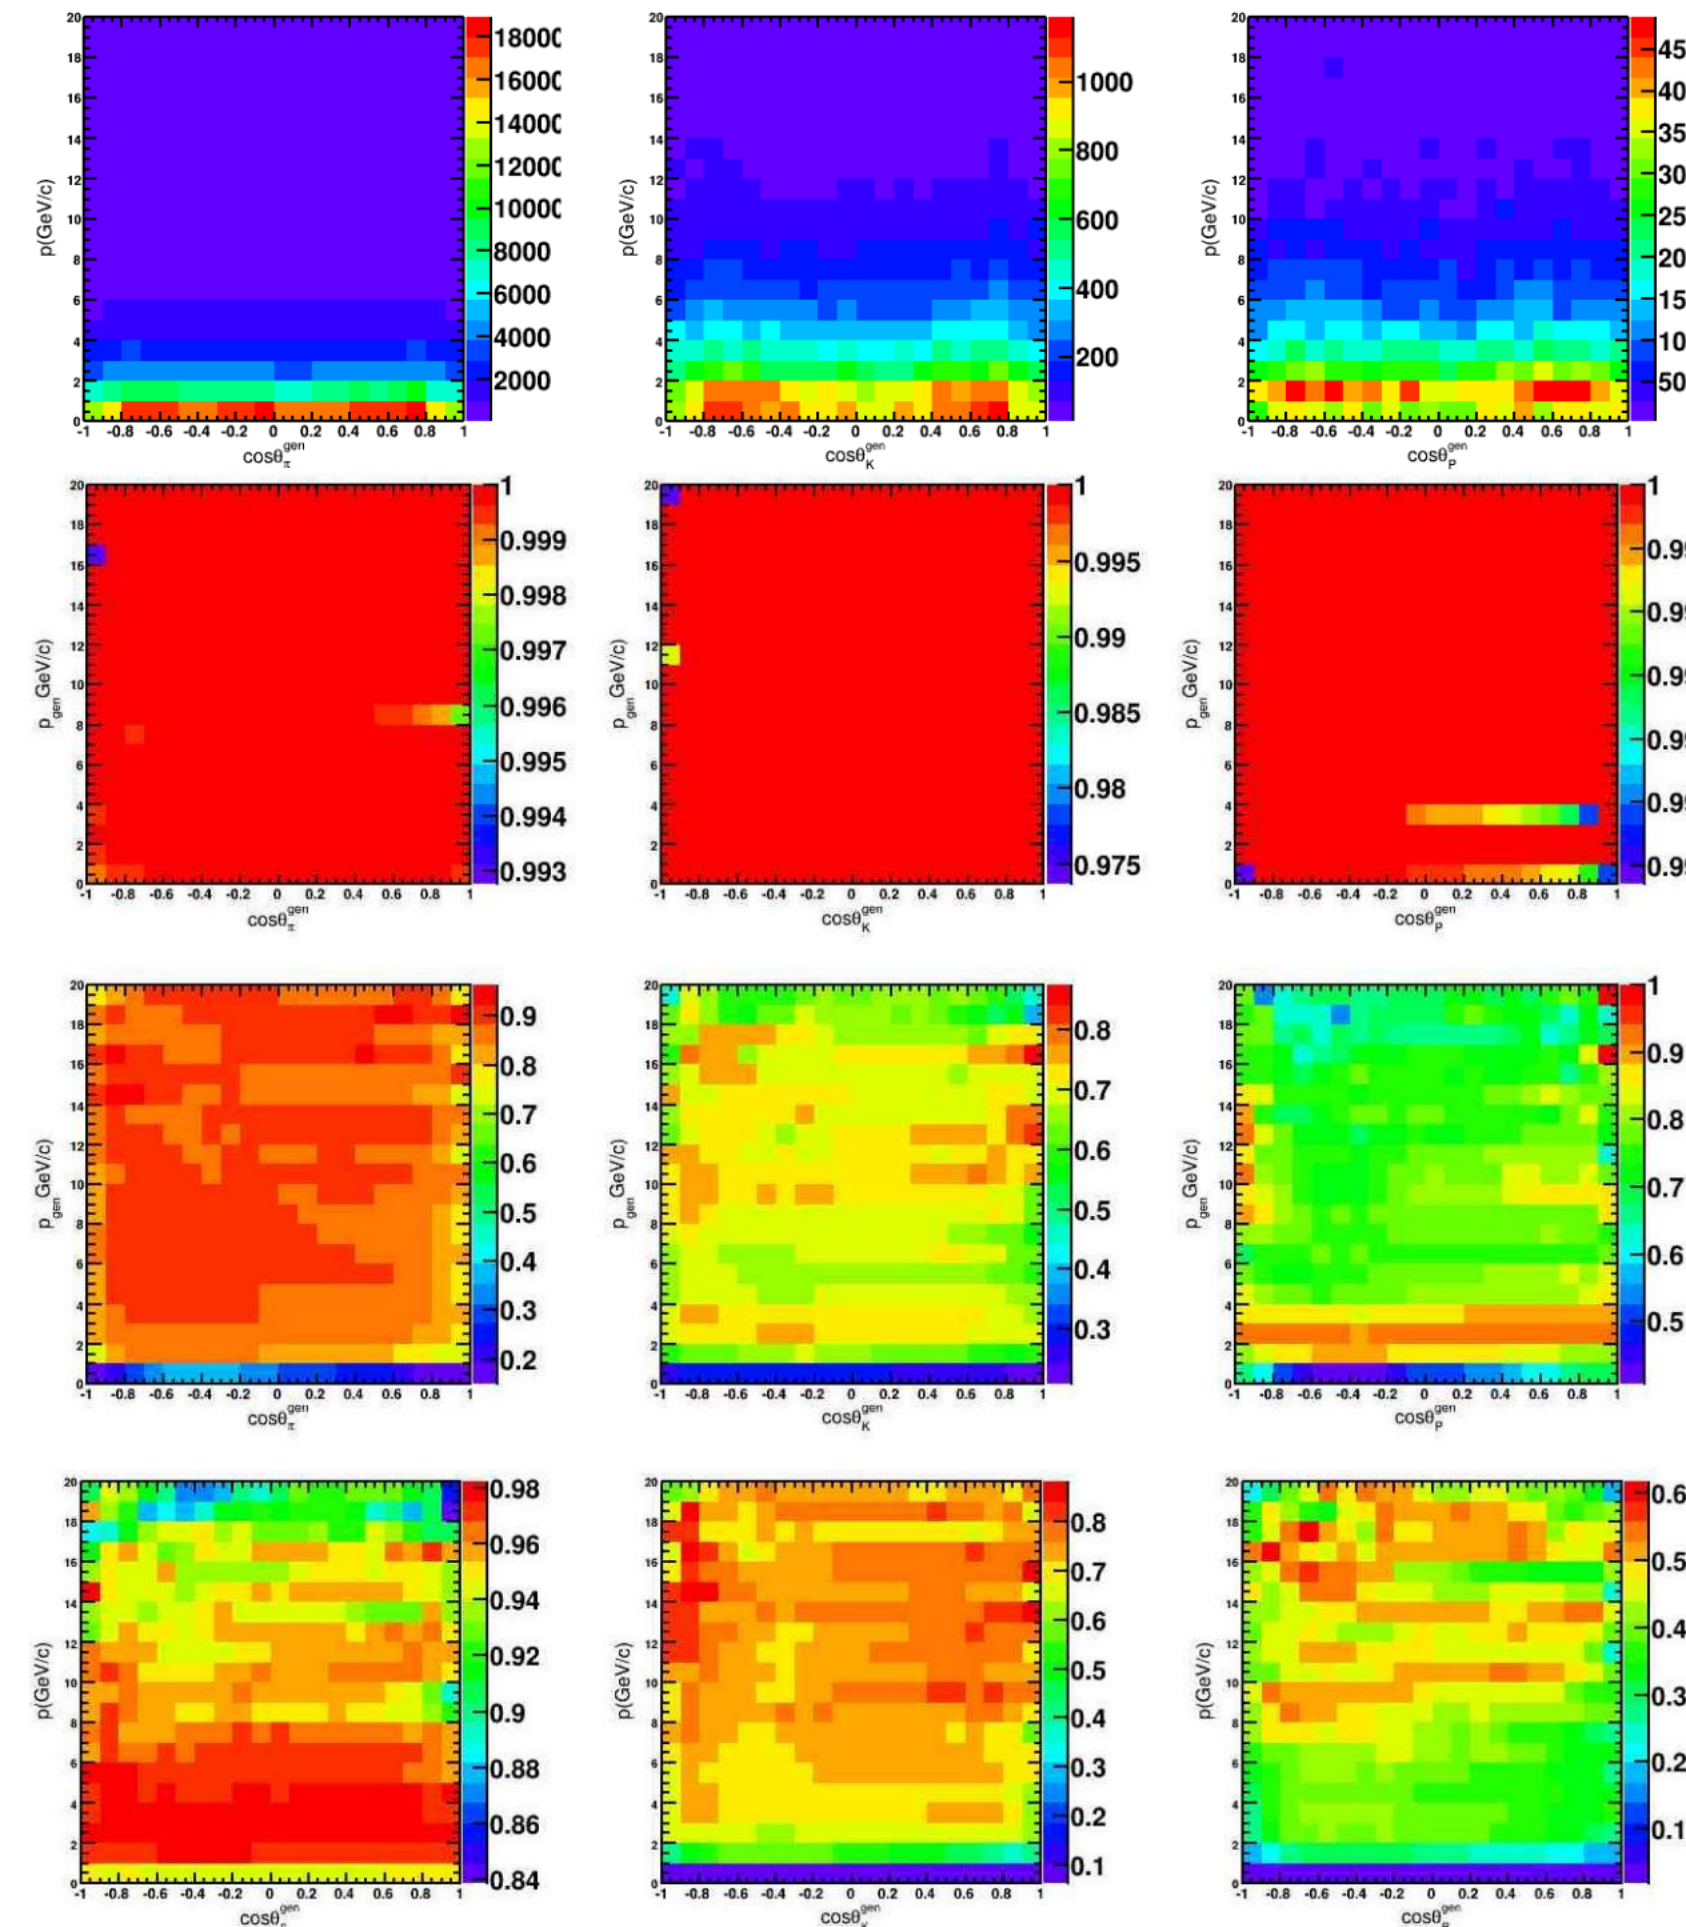

Layer	R(mm)	muon pair position
		0, 10
VXD-L1	12.5~18	
		23
VXD-L2	28~35	
		40
VXD-L3	45~53	
		150
ITK-L1	240	
		300
ITK-L2	350	
		450
ITK-L3	570	
TPC	600-1800	
		700
OTK	~1800	

- x-y correlation may be due to the particle gun θ, ϕ .
- Since x=10 is closer to the first hit than x=0, it is better than x=0.
 - **The number of hits, material budget, distance to the nearest hit** vary with the position of secondary vertex

PID

- PID using calorimeter under developing, will give a talk on this meeting soon (Ligang Xia, NJU)
- First look at PID @ $Z \rightarrow qq$. Last week $H \rightarrow gg$ (Xiaotian Ma)
- PID Code for CyberPFO submitted (Chenguang Zhang)

- ❖ Phase space
 $(p_{gen}, \cos\theta_{gen})$
0-20GeV
- ❖ Track efficiency
distribution of truth
 $\pi/K/p$ (have dN/dx or t)
- ❖ PID efficiency
distribution of truth
 $\pi/K/p$ (minimum combined χ^2)
- ❖ Purity distribution of truth $\pi/K/p$
