

Measurement of the $\gamma^* \gamma^* \rightarrow \pi^0 \pi^0$ Cross Section

Max Lellmann
 τ QCD Meeting
15.10.2025

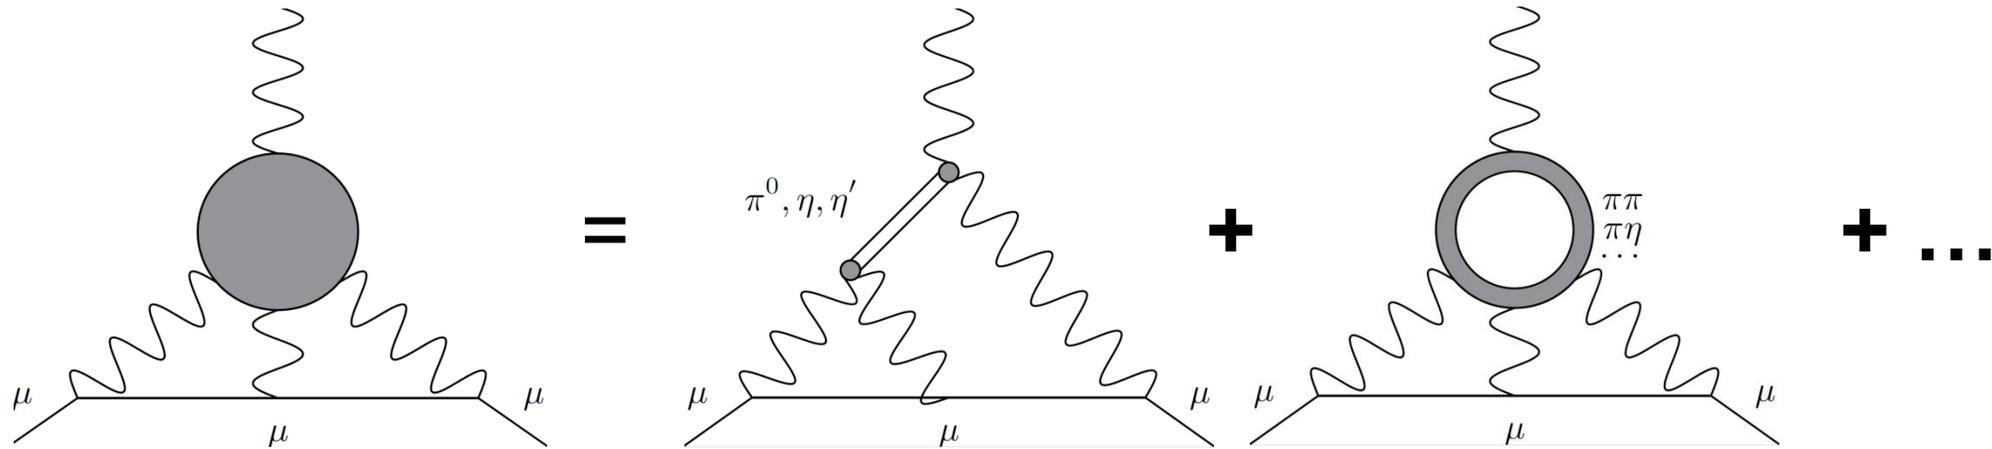

Motivation – The Muon Anomaly

- Muon anomaly $a_\mu = \frac{g_\mu^{-2}}{2}$
- Possible discrepancy between SM and direct measurement
- Need to increase accuracy SM prediction
- Next-to-leading-order hadronic interactions from hadronic Light-by-Light scattering

The Hadronic Light by Light Contribution

[Aliberti et. al. (2025)]

Four-Point Function Calculated by Dispersion Relations:

$$a_{\mu}^{\text{HLbL}} = \frac{\alpha^3}{432\pi^2} \int_0^{\infty} d\Sigma \Sigma^3 \int_0^1 dr r \sqrt{1-r^2} \int_0^{2\pi} d\phi \sum_{i=1}^{12} T_i(\Sigma, r, \phi) \bar{\Pi}_i(Q_1^2, Q_2^2, Q_3^2)$$

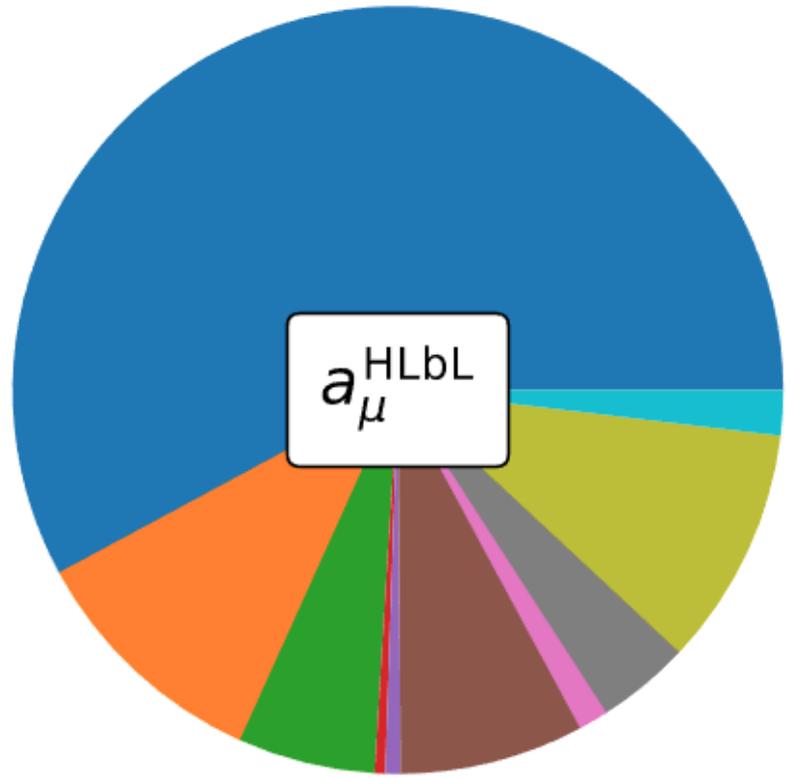

Two-Photon Couplings

[Colangelo, Hoferichter, Procura, Stoffer (2017)]

The Hadronic Light by Light Contribution

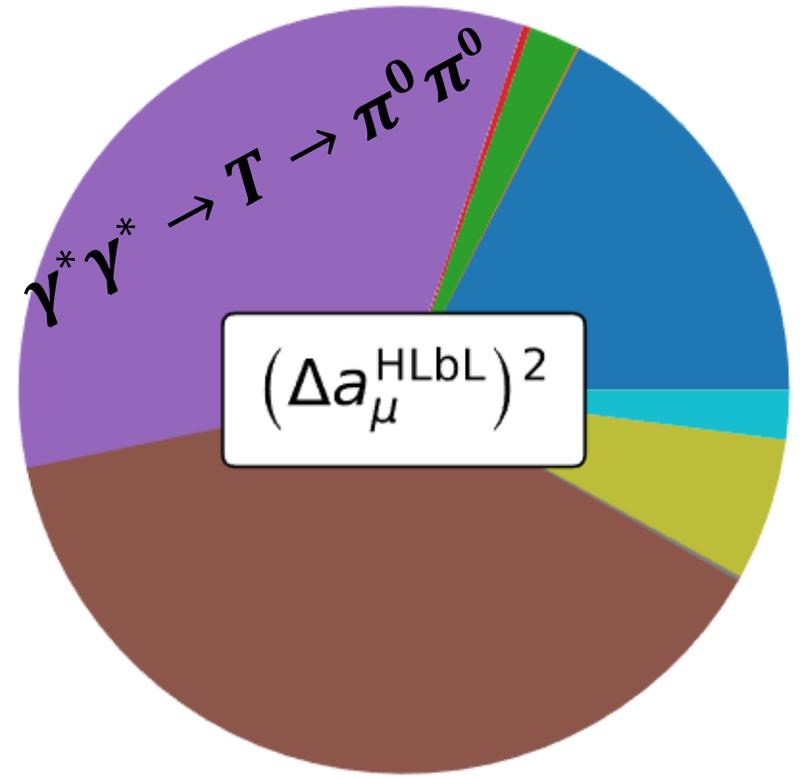

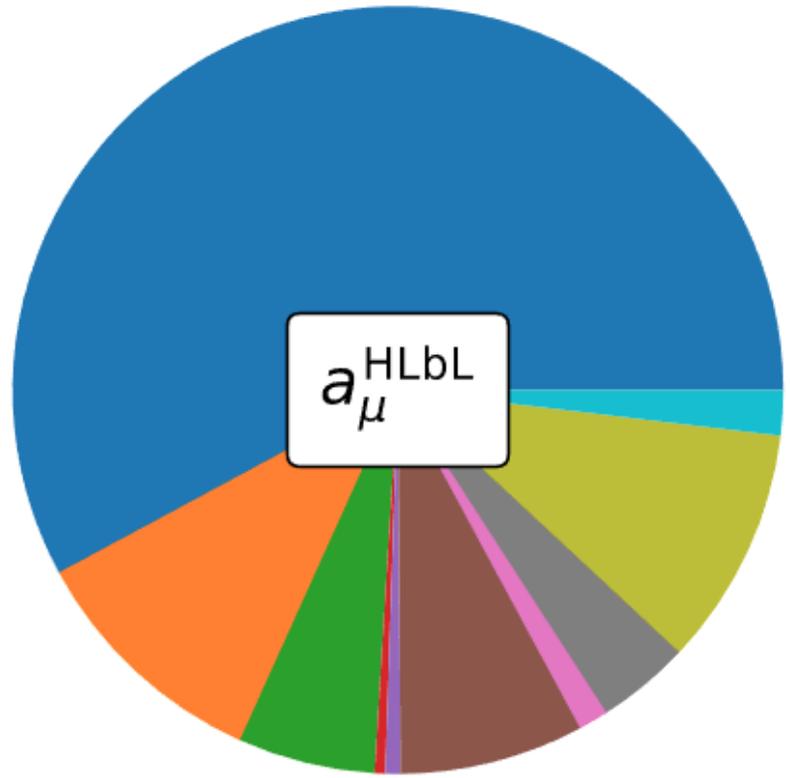

[Aliberti et. al. (2025)]

The Hadronic Light by Light Contribution

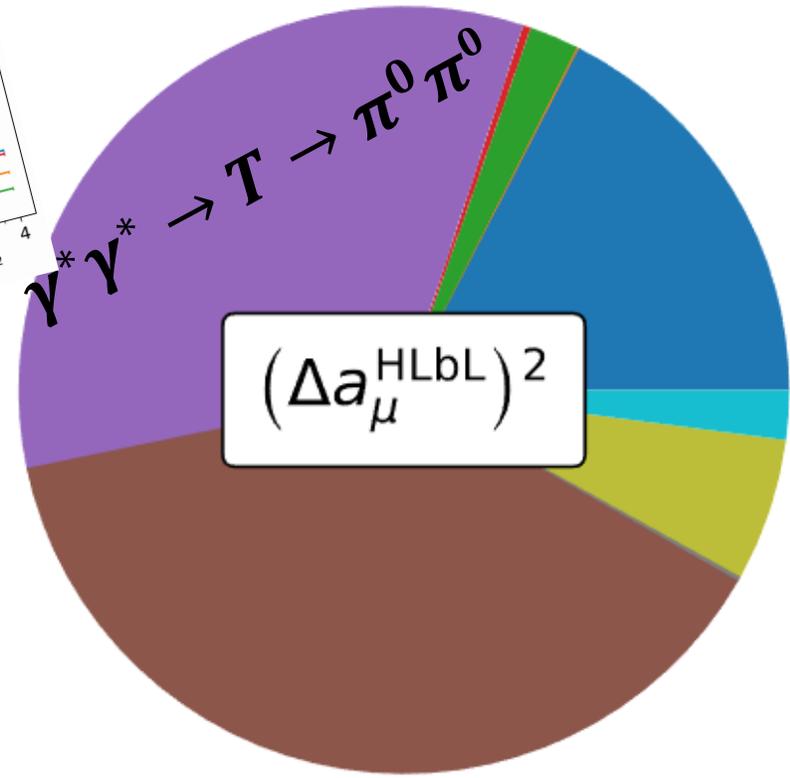

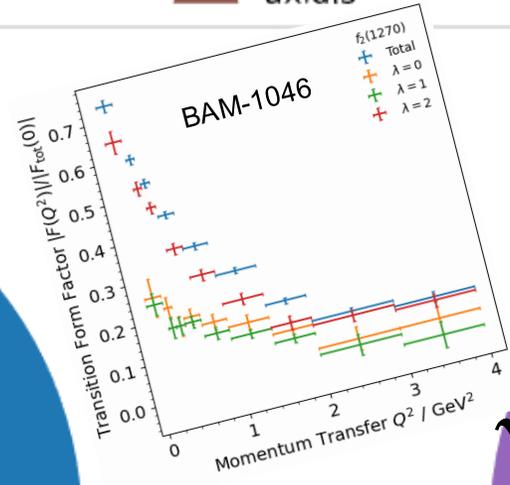

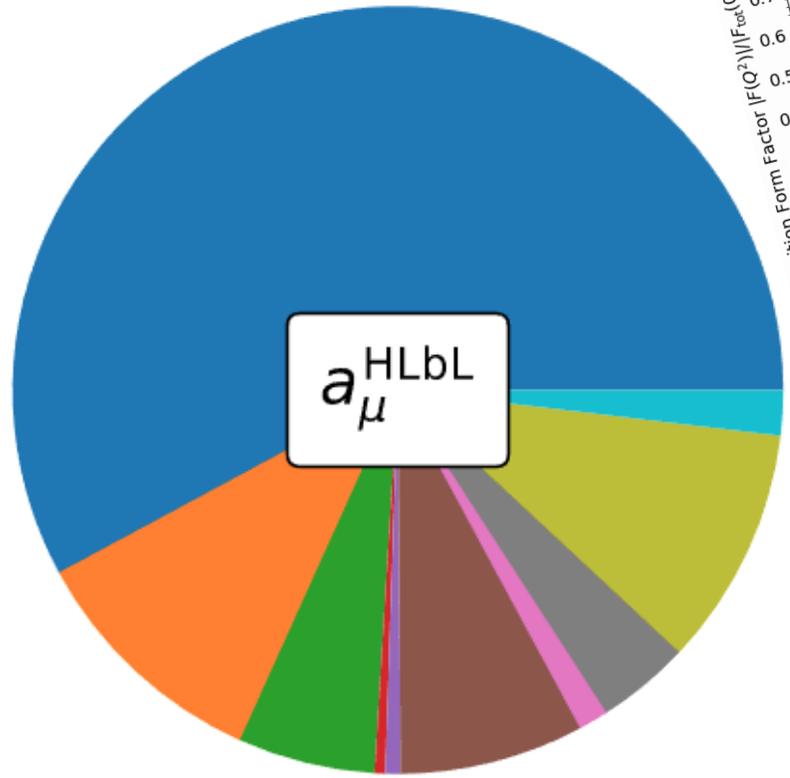

[Aliberti et. al. (2025)]

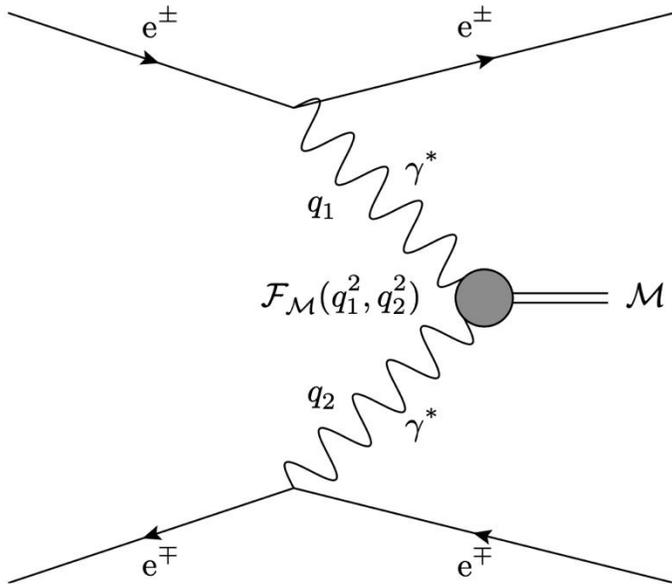

The Hadronic Light by Light Contribution

[Aliberti et. al. (2025)]

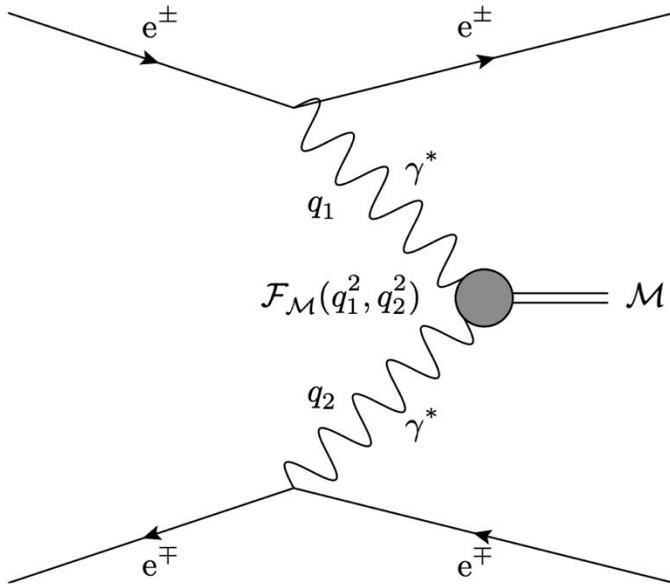

Two-Photon Physics at e^+e^- Machines

$$\begin{aligned}
 d\sigma &= \frac{\alpha^2}{16\pi^4 Q_1^2 Q_2^2} \frac{2\sqrt{X}}{s_{ee} (1 - 4m_e^2/s_{ee})^{1/2}} \cdot \frac{d^3\vec{p}'_1}{E'_1} \cdot \frac{d^3\vec{p}'_2}{E'_2} \\
 &\times \left\{ 4\rho_1^{++} \rho_2^{++} \sigma_{TT} + \rho_1^{00} \rho_2^{00} \sigma_{LL} + 2\rho_1^{++} \rho_2^{00} \sigma_{TL} + 2\rho_1^{00} \rho_2^{++} \sigma_{LT} \right. \\
 &\quad + 2(\rho_1^{++} - 1)(\rho_2^{++} - 1) \cos(2\tilde{\phi}) \tau_{TT} \\
 &\quad + 8 \left[\frac{(\rho_1^{00} + 1)(\rho_2^{00} + 1)}{(\rho_1^{++} - 1)(\rho_2^{++} - 1)} \right]^{1/2} \cos \tilde{\phi} \tilde{\tau}_{TL} \\
 &\quad + h_1 h_2 4 [(\rho_1^{00} + 1)(\rho_2^{00} + 1)]^{1/2} \tilde{\tau}_{TT} \\
 &\quad \left. + h_1 h_2 8 [(\rho_1^{++} - 1)(\rho_2^{++} - 1)]^{1/2} \cos \tilde{\phi} \tau_{TL} \right\},
 \end{aligned}$$

Two-Photon Physics at e^+e^- Machines

$$e^+e^- \rightarrow e^+e^-\pi^0\pi^0$$

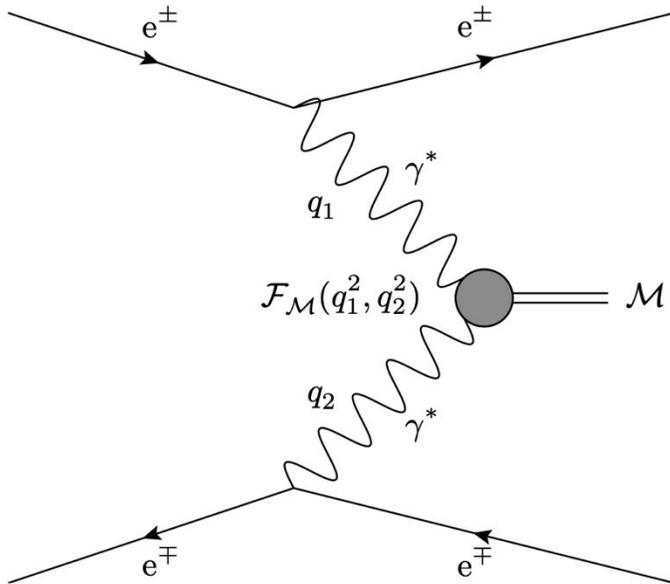

$$\begin{aligned}
 d\sigma &= \frac{\alpha^2}{16\pi^4 Q_1^2 Q_2^2} \frac{2\sqrt{X}}{s_{ee} (1 - 4m_e^2/s_{ee})^{1/2}} \cdot \frac{d^3\vec{p}'_1}{E'_1} \cdot \frac{d^3\vec{p}'_2}{E'_2} \\
 &\times \left\{ 4\rho_1^{++}\rho_2^{++}\sigma_{TT} + \rho_1^{00}\rho_2^{00}\sigma_{LL} + 2\rho_1^{++}\rho_2^{00}\sigma_{TL} + 2\rho_1^{00}\rho_2^{++}\sigma_{LT} \right. \\
 &\quad \left. + 2(\rho_1^{++} - 1)(\rho_2^{++} - 1)\cos(2\tilde{\phi})\tau_{TT} \right. \\
 &\quad \left. + 8\left[\frac{(\rho_1^{00} + 1)(\rho_2^{00} + 1)}{(\rho_1^{++} - 1)(\rho_2^{++} - 1)}\right]^{1/2}\cos\tilde{\phi}\tilde{\tau}_{TL} \right. \\
 &\quad \left. + h_1h_24\left[(\rho_1^{00} + 1)(\rho_2^{00} + 1)\right]^{1/2}\tilde{\tau}_{TT} \right. \\
 &\quad \left. + h_1h_28\left[(\rho_1^{++} - 1)(\rho_2^{++} - 1)\right]^{1/2}\cos\tilde{\phi}\tau_{TL} \right\},
 \end{aligned}$$

$\gamma\gamma \rightarrow \pi^0\pi^0$

Two-Photon Physics at e^+e^- Machines

$$e^+e^- \rightarrow e^+e^-\pi^0\pi^0$$

$$\begin{aligned}
 d\sigma &= \frac{\alpha^2}{16\pi^4 Q_1^2 Q_2^2} \frac{2\sqrt{X}}{s_{ee} (1 - 4m_e^2/s_{ee})^{1/2}} \cdot \frac{d^3\vec{p}'_1}{E'_1} \cdot \frac{d^3\vec{p}'_2}{E'_2} \\
 &\times \left\{ 4\rho_1^{++}\rho_2^{++}\sigma_{TT} + \rho_1^{00}\rho_2^{00}\sigma_{LL} + 2\rho_1^{++}\rho_2^{00}\sigma_{TL} + 2\rho_1^{00}\rho_2^{++}\sigma_{LT} \right. \\
 &\quad \left. + 2(\rho_1^{++}-1)(\rho_2^{++}-1)\cos(2\tilde{\phi})\tau_{TT} \right. \\
 &\quad \left. + 8 \left[\frac{(\rho_1^{00}+1)(\rho_2^{00}+1)}{(\rho_1^{++}-1)(\rho_2^{++}-1)} \right]^{1/2} \cos\tilde{\phi}\tilde{\tau}_{TL} \right. \\
 &\quad \left. + h_1 h_2 4 \left[(\rho_1^{00}+1)(\rho_2^{00}+1) \right]^{1/2} \tilde{\tau}_{TT} \right. \\
 &\quad \left. + h_1 h_2 8 \left[(\rho_1^{++}-1)(\rho_2^{++}-1) \right]^{1/2} \cos\tilde{\phi}\tau_{TL} \right\},
 \end{aligned}$$

$\gamma\gamma \rightarrow \pi^0\pi^0$

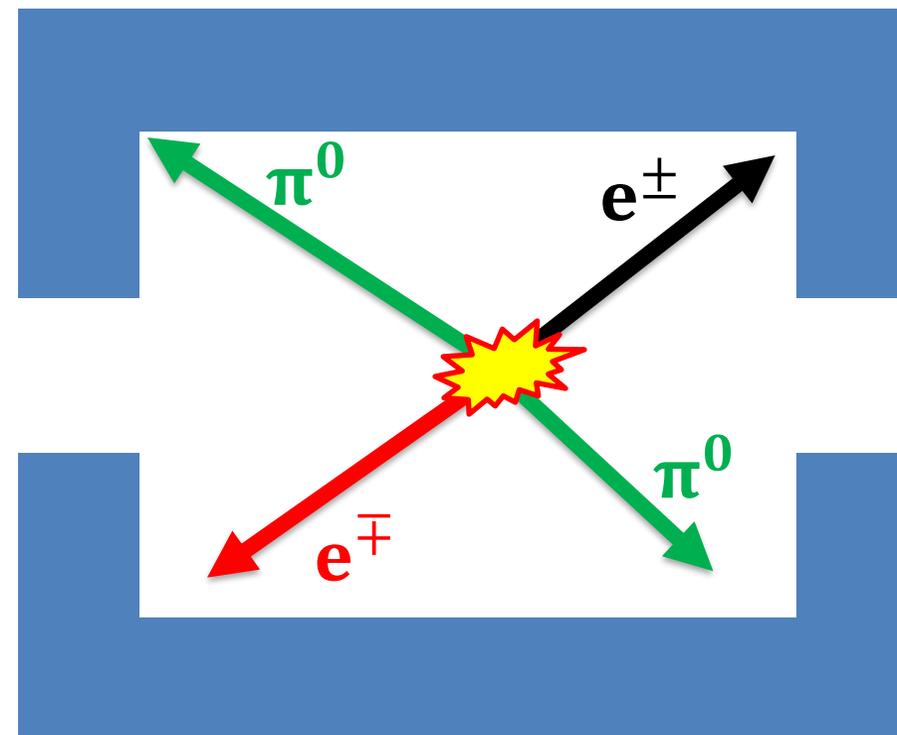

$$\frac{d^3\sigma}{dW dQ_1^2 dQ_2^2} = \frac{d^3L_{TT}}{dW dQ_1^2 dQ_2^2} \sigma_{TT} + \frac{d^3L_{LT}}{dW dQ_1^2 dQ_2^2} \sigma_{LT} + \frac{d^3L_{TL}}{dW dQ_1^2 dQ_2^2} \sigma_{TL} + \frac{d^3L_{LL}}{dW dQ_1^2 dQ_2^2} \sigma_{LL}$$

The Double Tag Approach

- Photon virtuality equals lepton momentum transfers

$$Q_i^2 \approx 4E_i E_i' \sin^2 \frac{\theta_i}{2}$$

- Very strong drop of cross-sections with virtuality
- Actual double tagging most likely unfeasible
- Solution: Extension of the Single Tagged approach (BAM-1046)

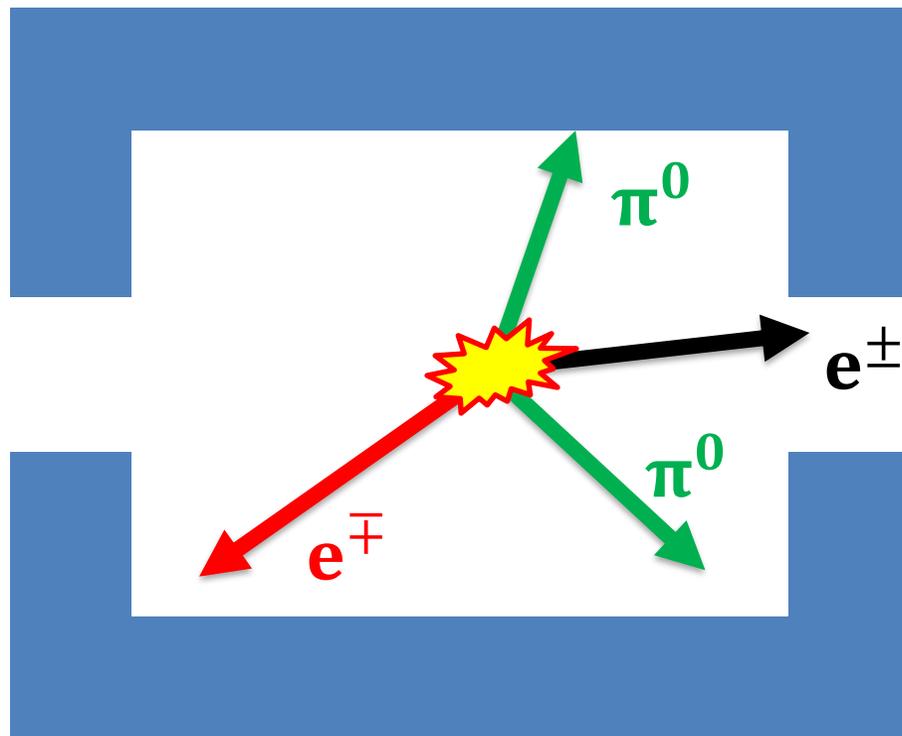

The Double Tag Approach

- Photon virtuality equals lepton momentum transfers

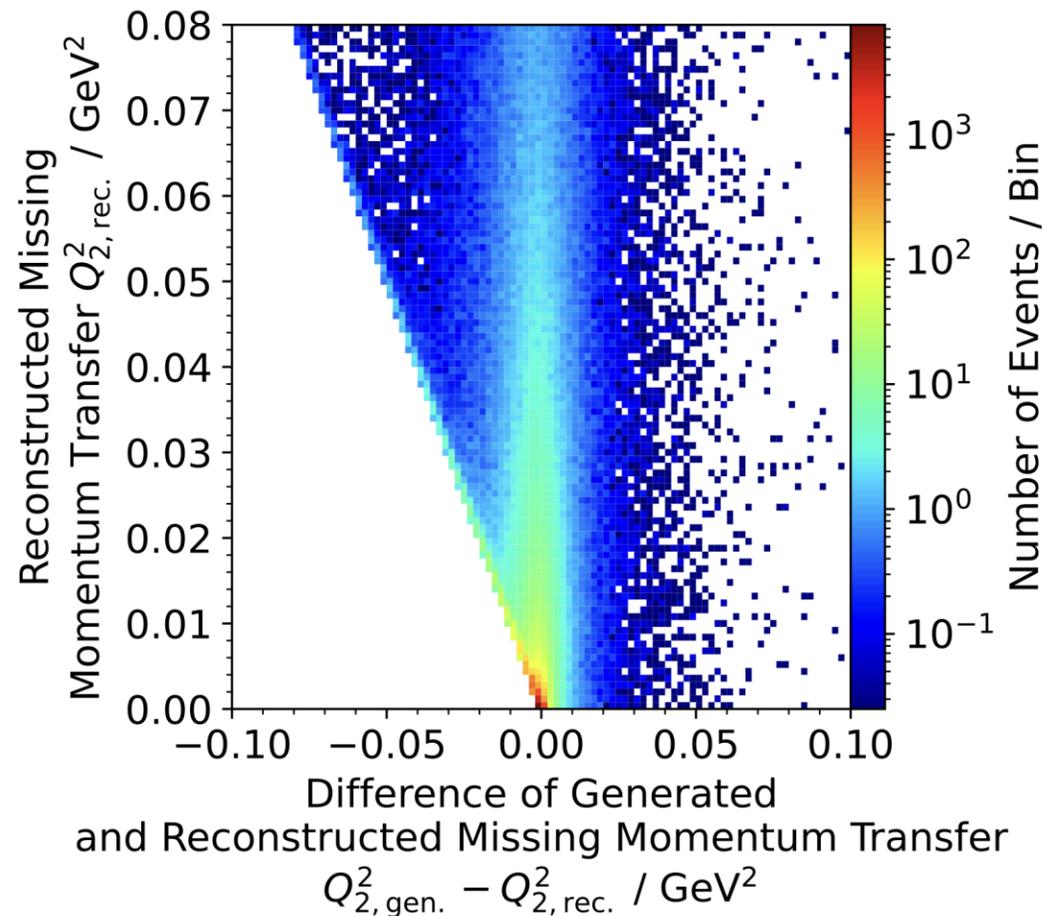

$$Q_i^2 \approx 4E_i E_i' \sin^2 \frac{\theta_i}{2}$$

- Very strong drop of cross-sections with virtuality
- Actual double tagging unfeasible with current statistics
- Solution: Extension of the Single Tagged approach (BAM-1046)

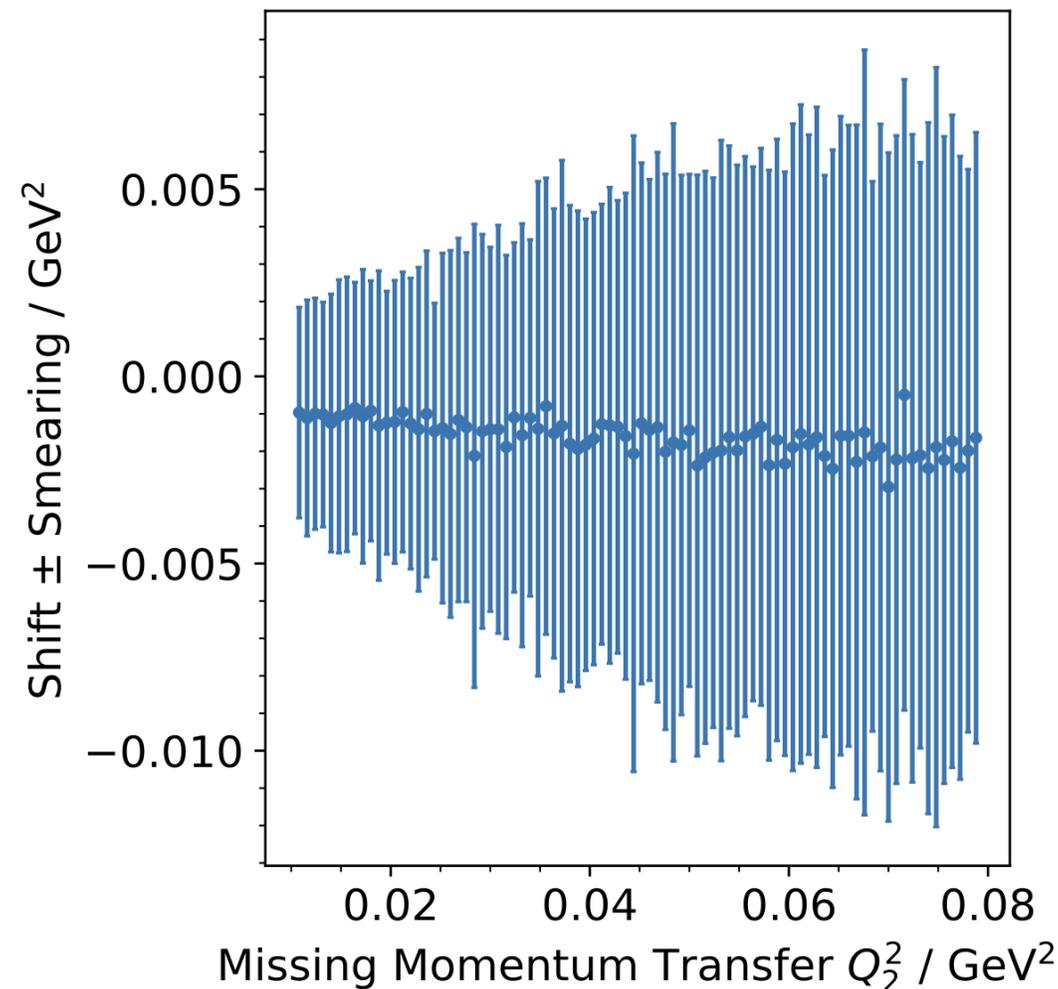

Quick Reminder on BAM-1046

- Event Selection
 - One good charged track
 - Identified as electron/Positron by EoP criterion
 - At least four good photon candidates
 - 1C Kin. Fit (Missing Lepton, $\chi^2 < 200$)
 - 3C Kin. Fit (Two Pions, no convergence required)
 - Use all of the 3.773 GeV data
- Constraint to singly virtual event using cut on the missing momentum transfer
 - Dramatically increased resolution due to kinematic fit
- Use same selection in this analysis!

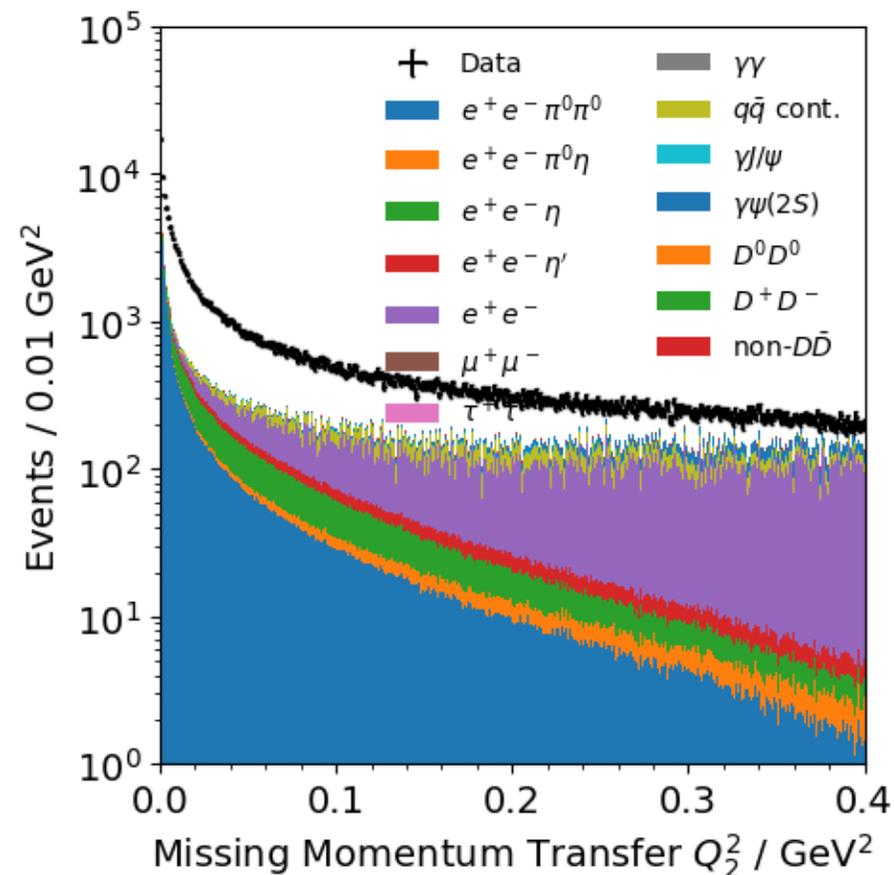

Quick Reminder on BAM-1046

- Event Selection
 - One good charged track
 - Identified as electron/Positron by EoP criterion
 - At least four good photon candidates
 - 1C Kin. Fit (Missing Lepton, $\chi^2 < 200$)
 - 3C Kin. Fit (Two Pions, no convergence required)
 - Use all of the 3.773 GeV data
- Constraint to singly virtual event using cut on the missing momentum transfer
 - Dramatically increased resolution due to kinematic fit
- Use same selection in this analysis!

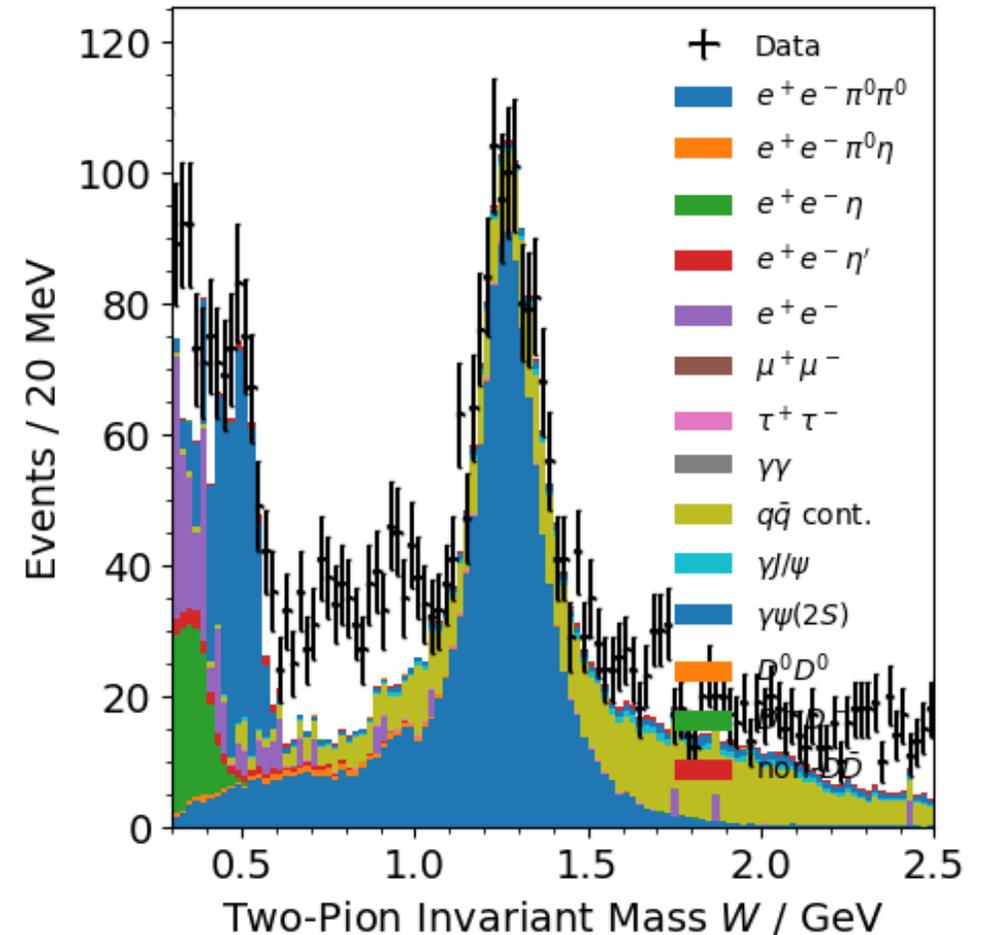

Event Selection – Missing Q^2

- High level of background contamination at larger Momentum transfer
- Going much above $Q^2 \sim 0.3 \text{ GeV}^2$ probably not possible due to large background and small signal
- At very small Q^2 contamination from singly virtual production
- Q^2 range $\sim 0.08 \text{ GeV}^2 - 0.3 \text{ GeV}^2$

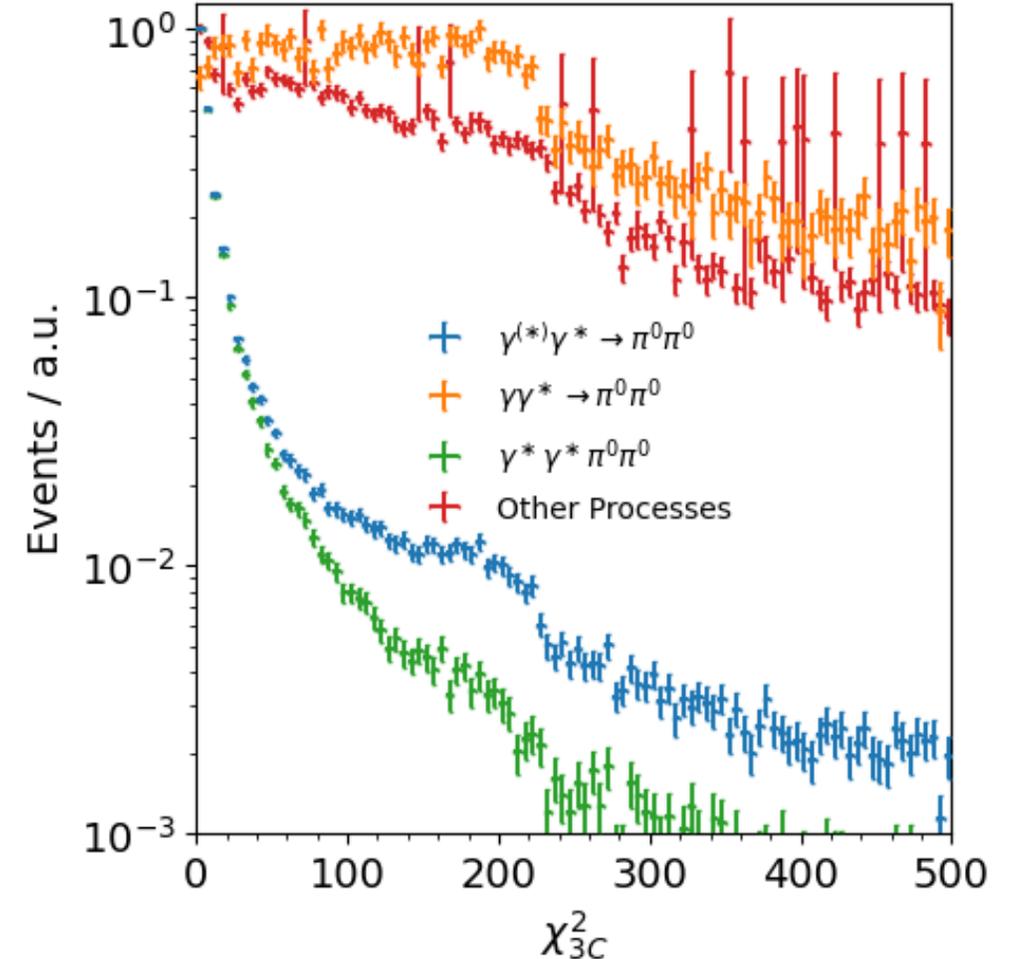

Event Selection – Converged 3C Kin. Fit

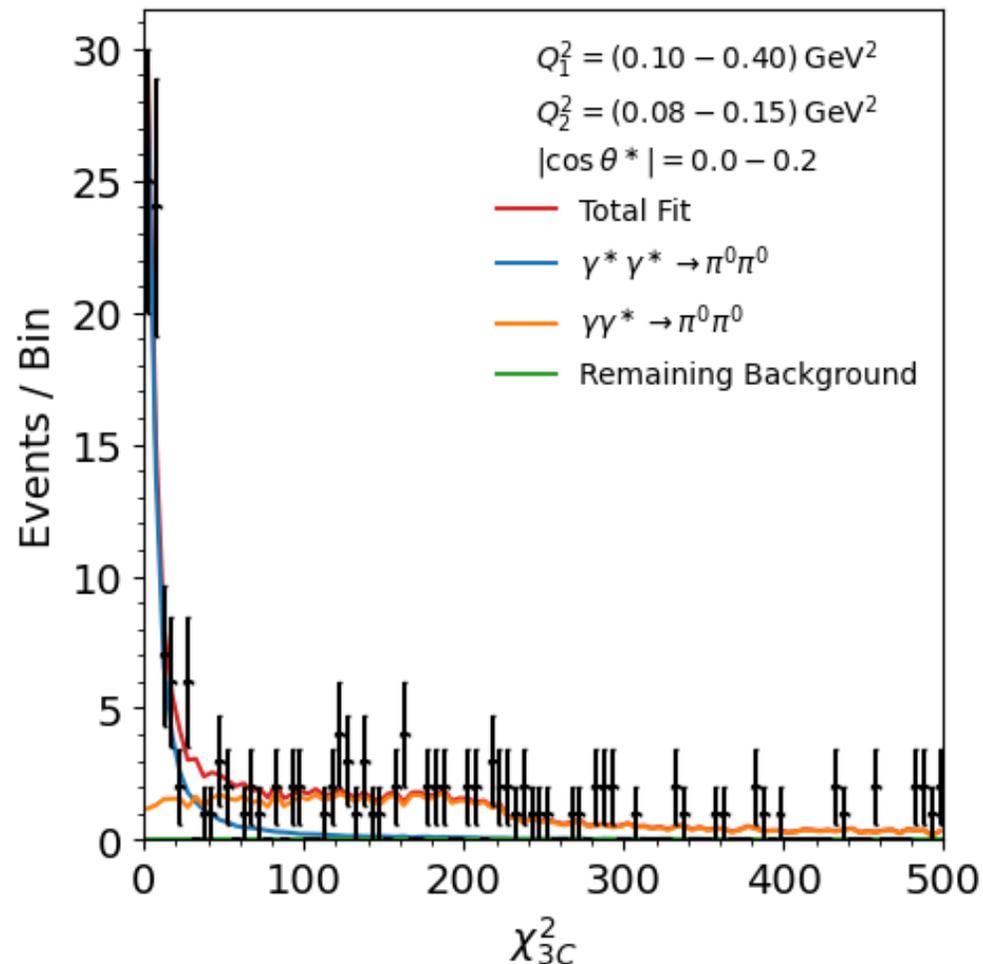

- After convergence requirement of clear indication of $f_2(1270)$
- Large amount of backgrounds at smaller and larger masses
- Generally small statistics
- Restrict cross section measurement to $f_2(1270)$ mass range 1-1.5 GeV

- Fit χ_{3C}^2 spectra
 - Similar to BAM-1046
- Additional complication: Contamination from Singly virtual events
 - Significantly different shapes of χ^2 distributions
- Fit different MC distributions and polynomials to the data to extract signal

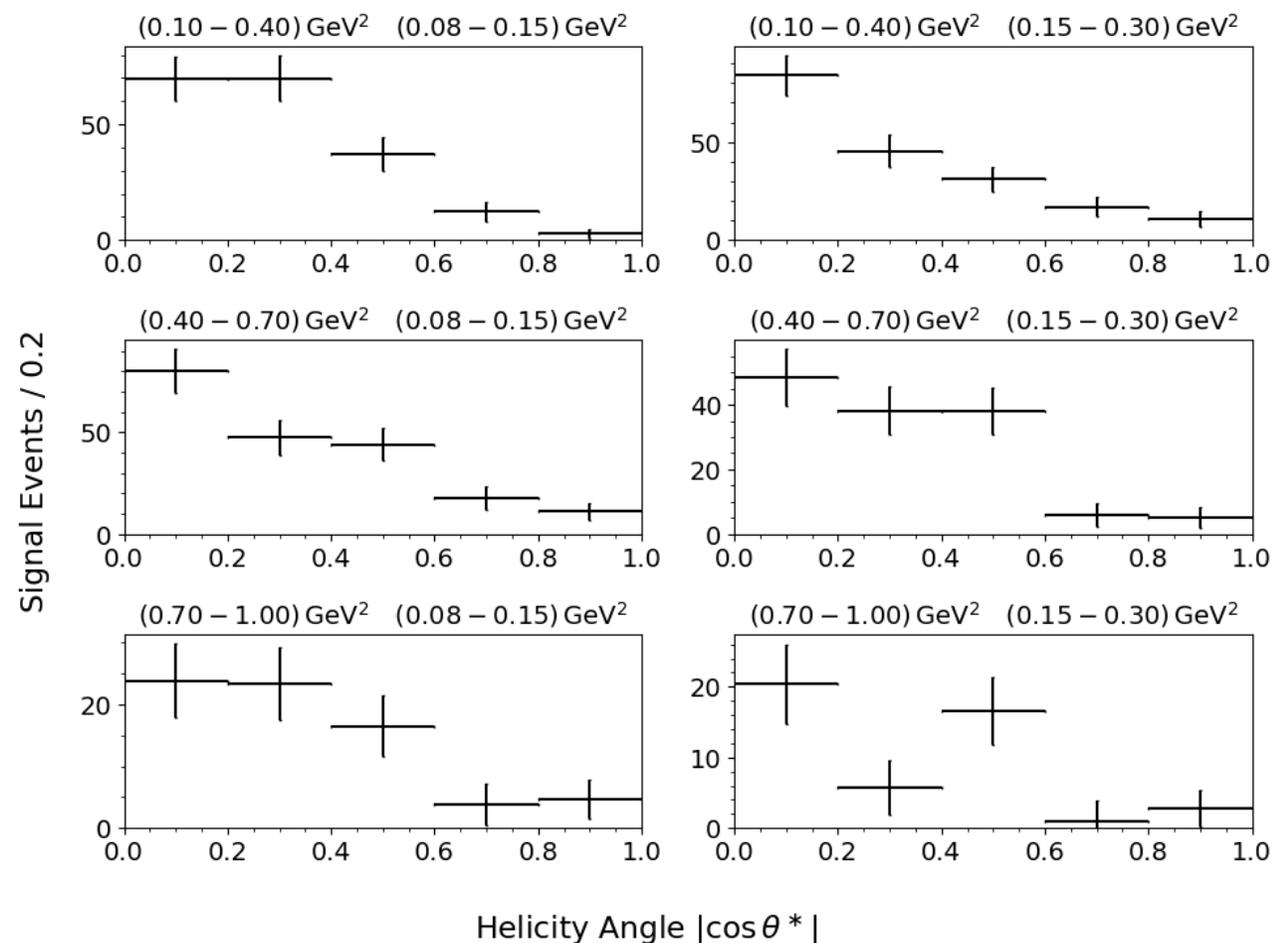

- Fit χ_{3C}^2 spectra
 - Similar to BAM-1046
- Additional complication: Contamination from Singly virtual events
 - Significantly different shapes of χ^2 distributions
- Fit different MC distributions and polynomials to the data to extract signal

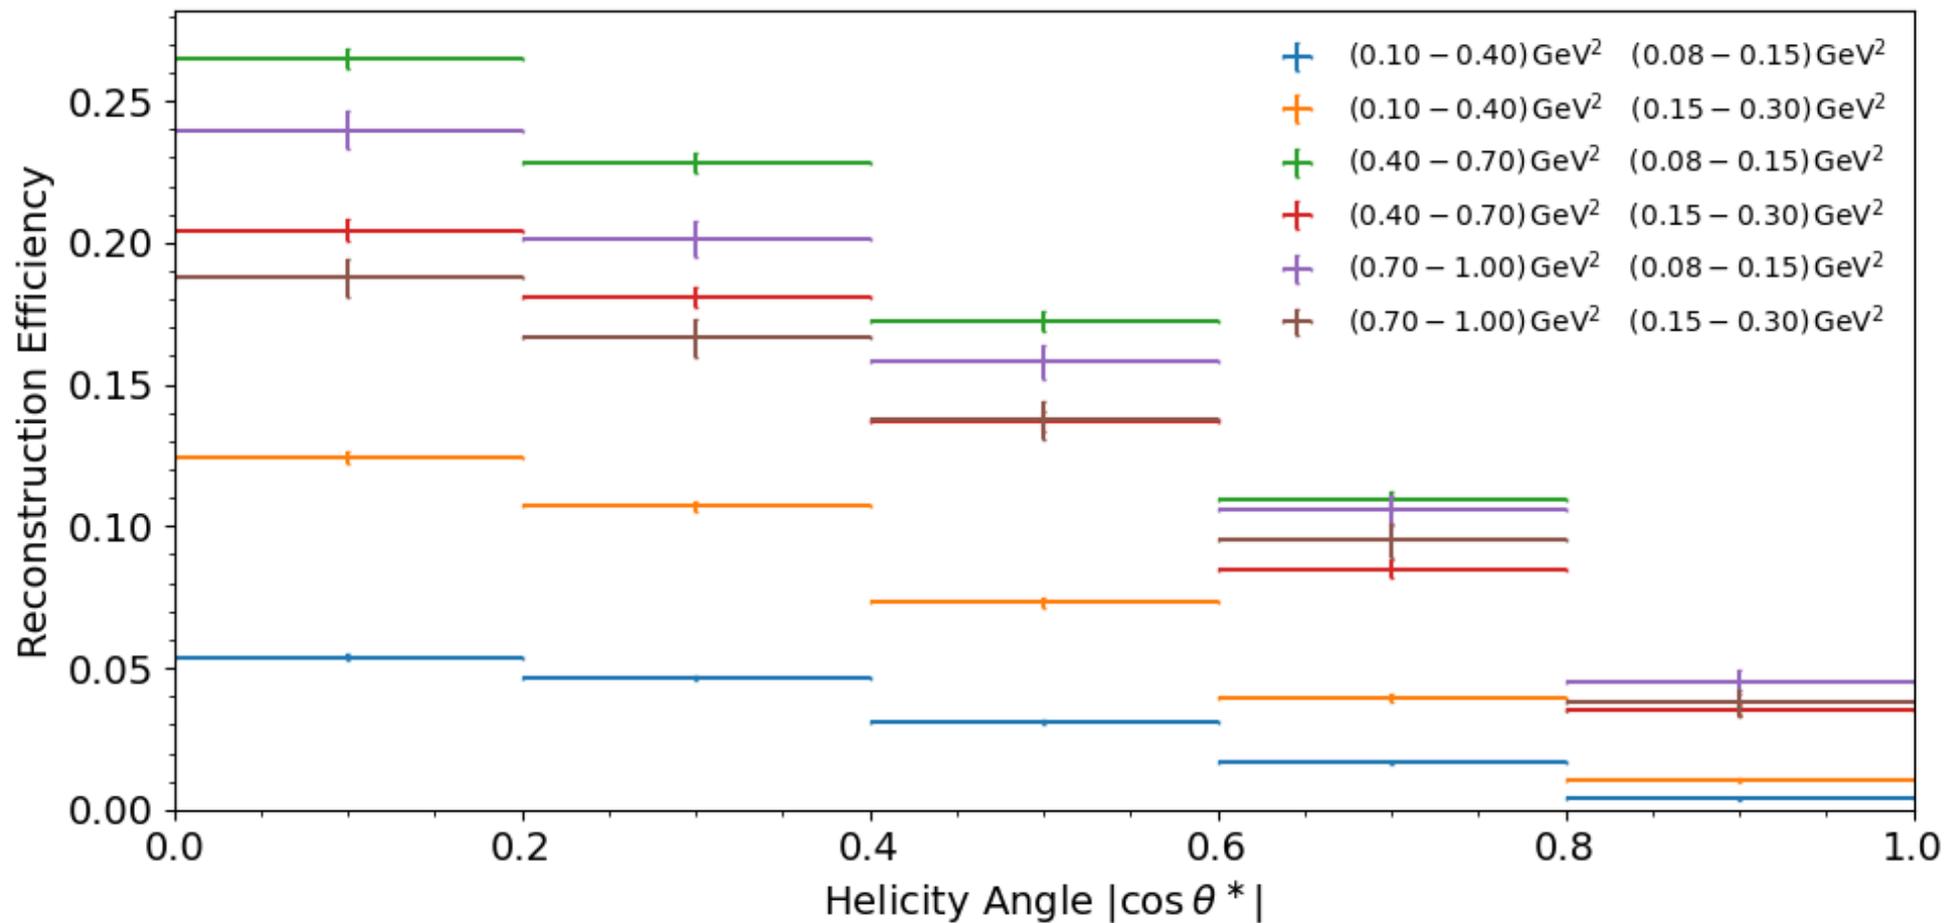

Background Subtraction

- Fit χ^2_{3C} spectra
 - Similar to BAM-1046
- Additional complication: Contamination from Singly virtual events
 - Significantly different shapes of χ^2 distributions
- Fit different MC distributions and polynomials to the data to extract signal

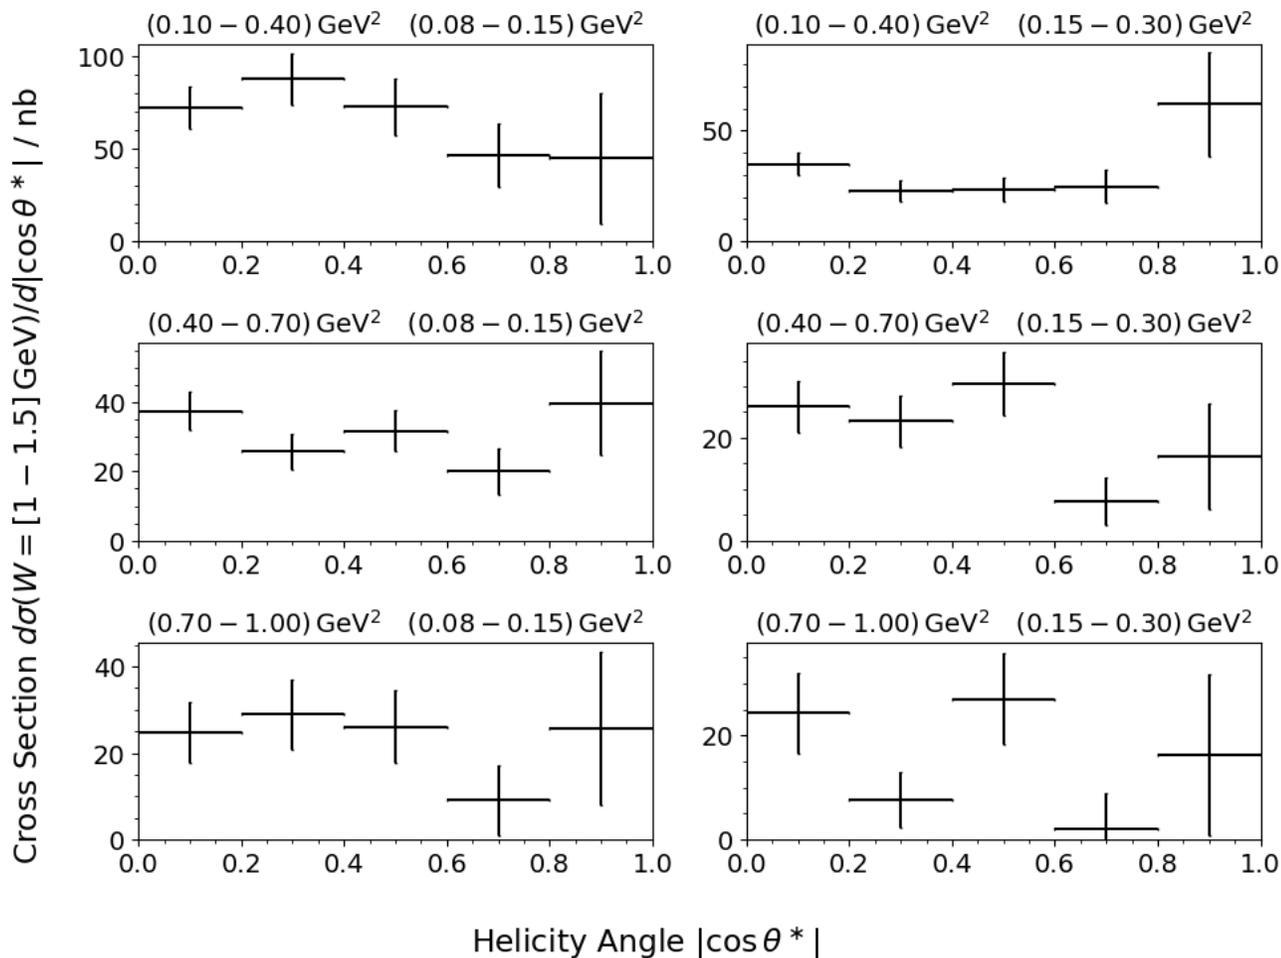

Reconstruction Efficiency

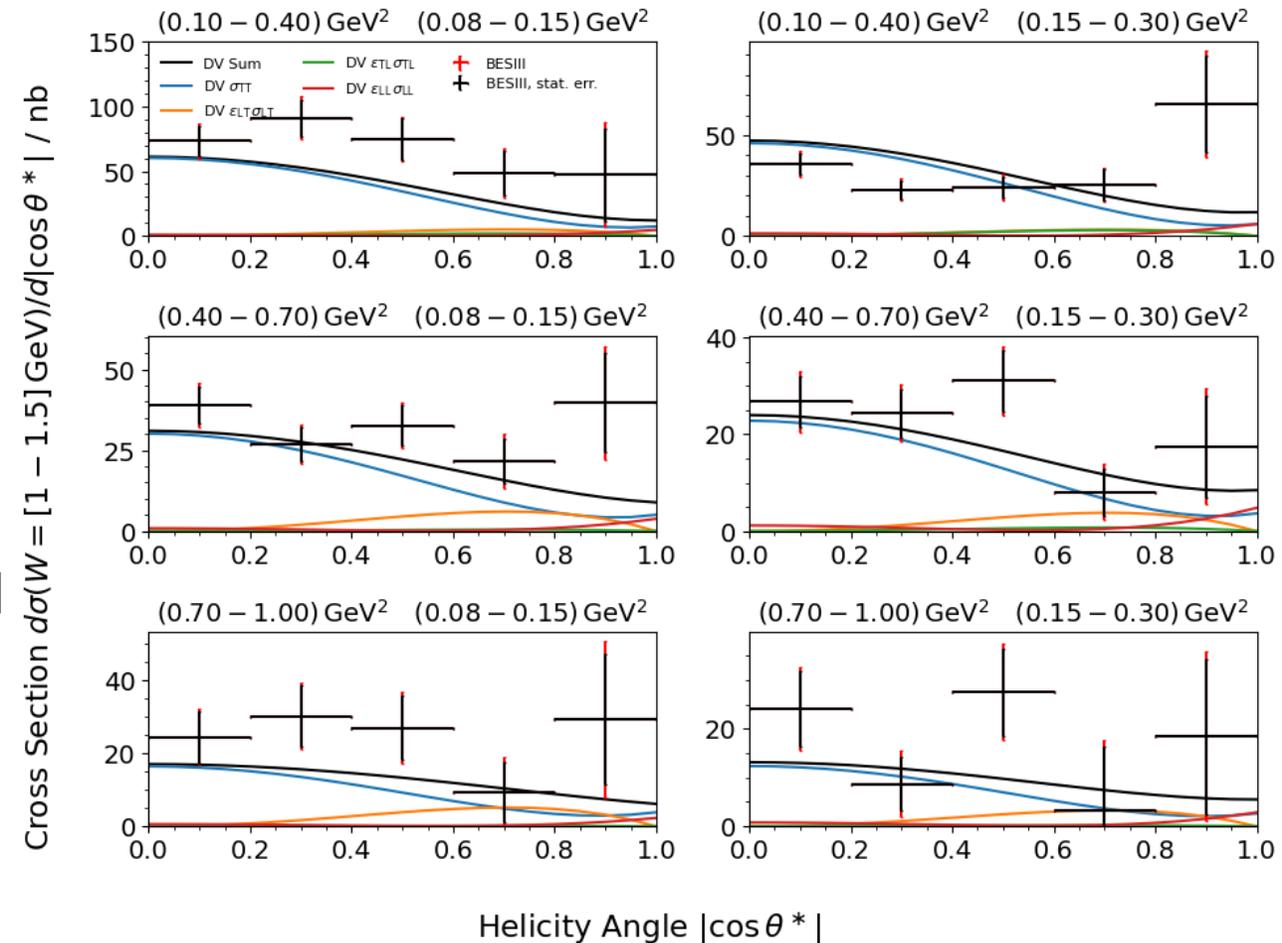

Determination of Cross Sections

$$d\sigma/d|\cos\theta^*| = d(\sigma_{TT} + \varepsilon_{LT}\sigma_{LT} + \varepsilon_{TL}\sigma_{TL} + \varepsilon_{LL}\sigma_{LL})/|\cos\theta^*| = \frac{N}{\Delta_{Q_1^2}\Delta_{Q_2^2}\Delta_W\Delta|\cos\theta^*|\varepsilon L_{int}} \frac{d^3L_{TT}}{dQ_1^2 dQ_2^2 dW}$$

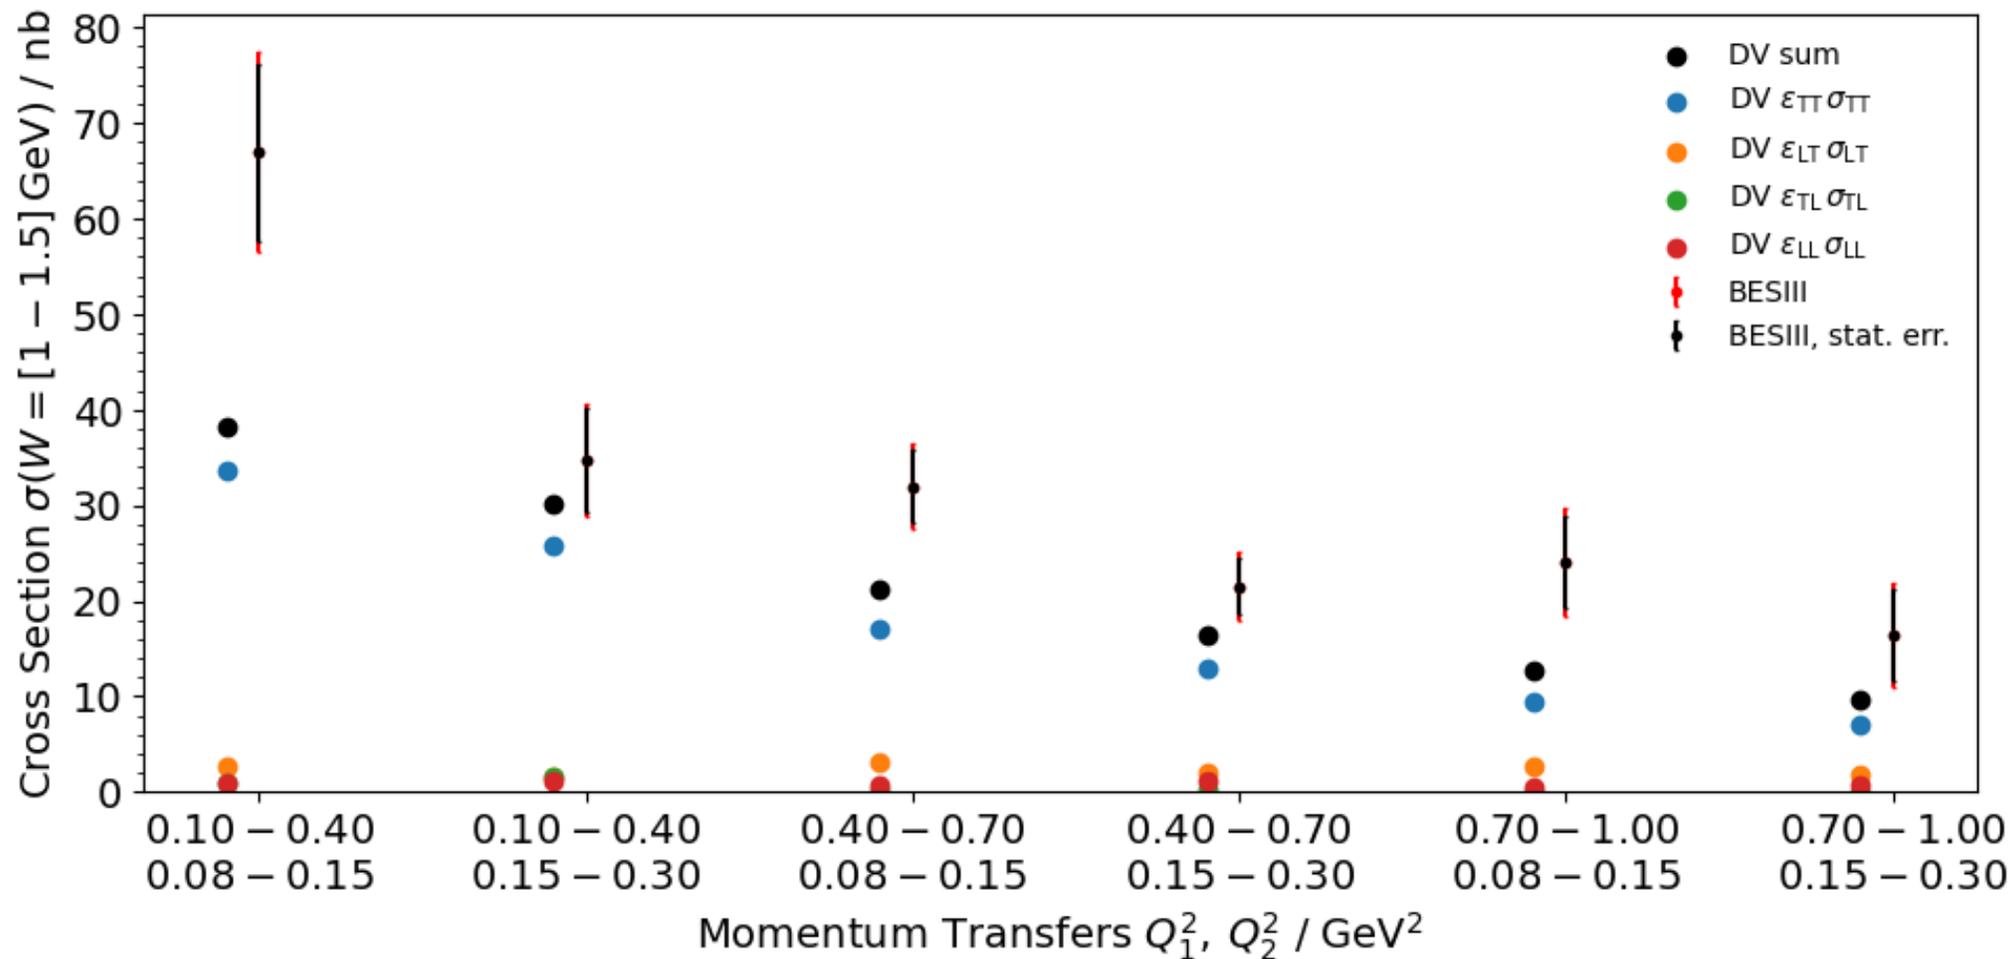

Systematic Uncertainties

- Determination equivalent to BAM-1046
 - Electron/Pion Tagging
 - Luminosity
 - Analysis Constraints
 - ~~Luminosity Function~~
 - Efficiency Correction
 - Background Subtraction
 - ~~Other Two Photon Processes~~
- Rather conservative but small compared to statistical uncertainty
- Comparison to Dispersive Theory by Danilkin and Vanderhaeghen

Helicity Angle Integrated Cross Section

Extraction of Transition Form Factors

- In BAM-1046 the extraction of transition form factor was possible using PWA
- Here are 5 different helicity contributions
- Only 5 data points in each Q^2 bin: Determination not possible
- Also: Two pairs of two form factors have same helicity angle behavior
 - Dispersive constraints required for determination of Form Factors
 - Model dependent
- S-wave contribution?

Publication of the Cross Sections probably better

- First double virtual measurement of the two photon production cross section of a tensor state
- Completely new ansatz
- Second doubly virtual measurement of any hadronic final state (after BaBar $\gamma^* \gamma^* \rightarrow \eta'$)
- Muon g-2 relevant momentum transfer range
- Measurement statistically limited
- Memo in preparation
