增大管径，减小流速！

# 为何选择蒸发式CO<sub>2</sub>冷却?

- **超高传热效率**

→ 传热系数 ( $\alpha$ ) 远高于单相 → 降低传感器与流体间温差 ( $\Delta T$ )

- **低流量 & 紧凑设计**

→ 质量流量 ( $m$ ) 低 → 管道直径 ( $\phi$ ) 更小 → 材料成本与体积减少

- **全域均匀冷却**

→ 管道温度近乎恒定 (仅受微小压差 $\Delta p$ 影响) → 长距离管线仍保持稳定

# 为何选择CO<sub>2</sub>?

- **抗辐射性极强**

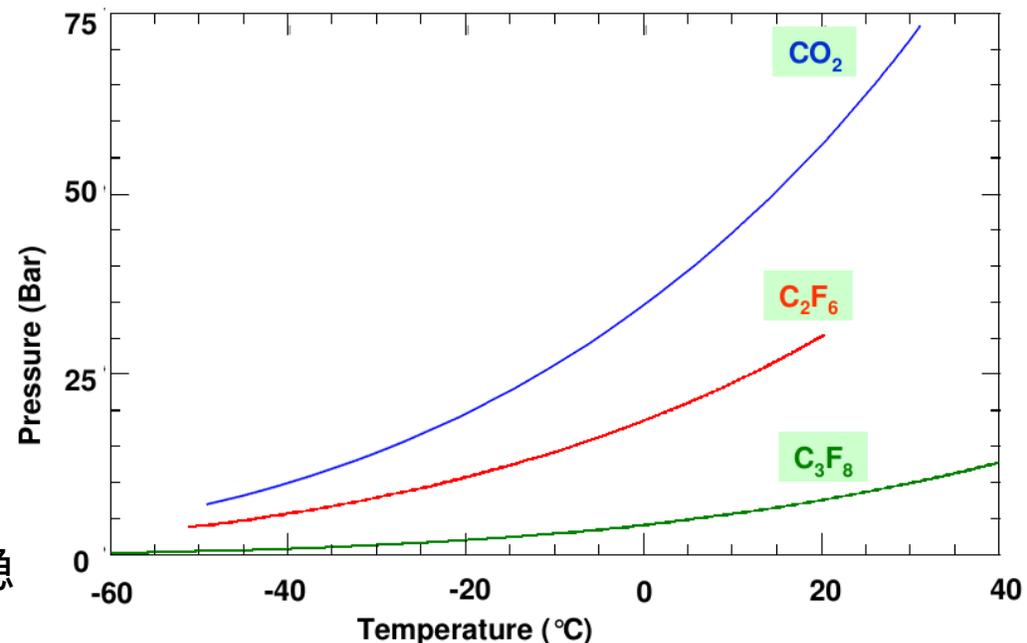

→ 传统制冷剂易被电离辐射破坏, CO<sub>2</sub>稳定性卓越

- **高压 & 小管径**

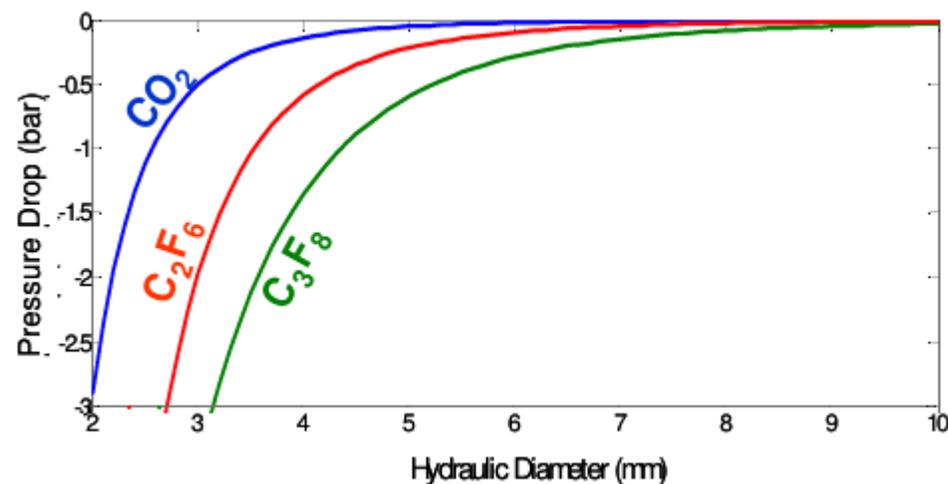

→ 高压流体 → 温降 (温度滑移) 极小 → 适用于微型化系统

- **环保无毒**

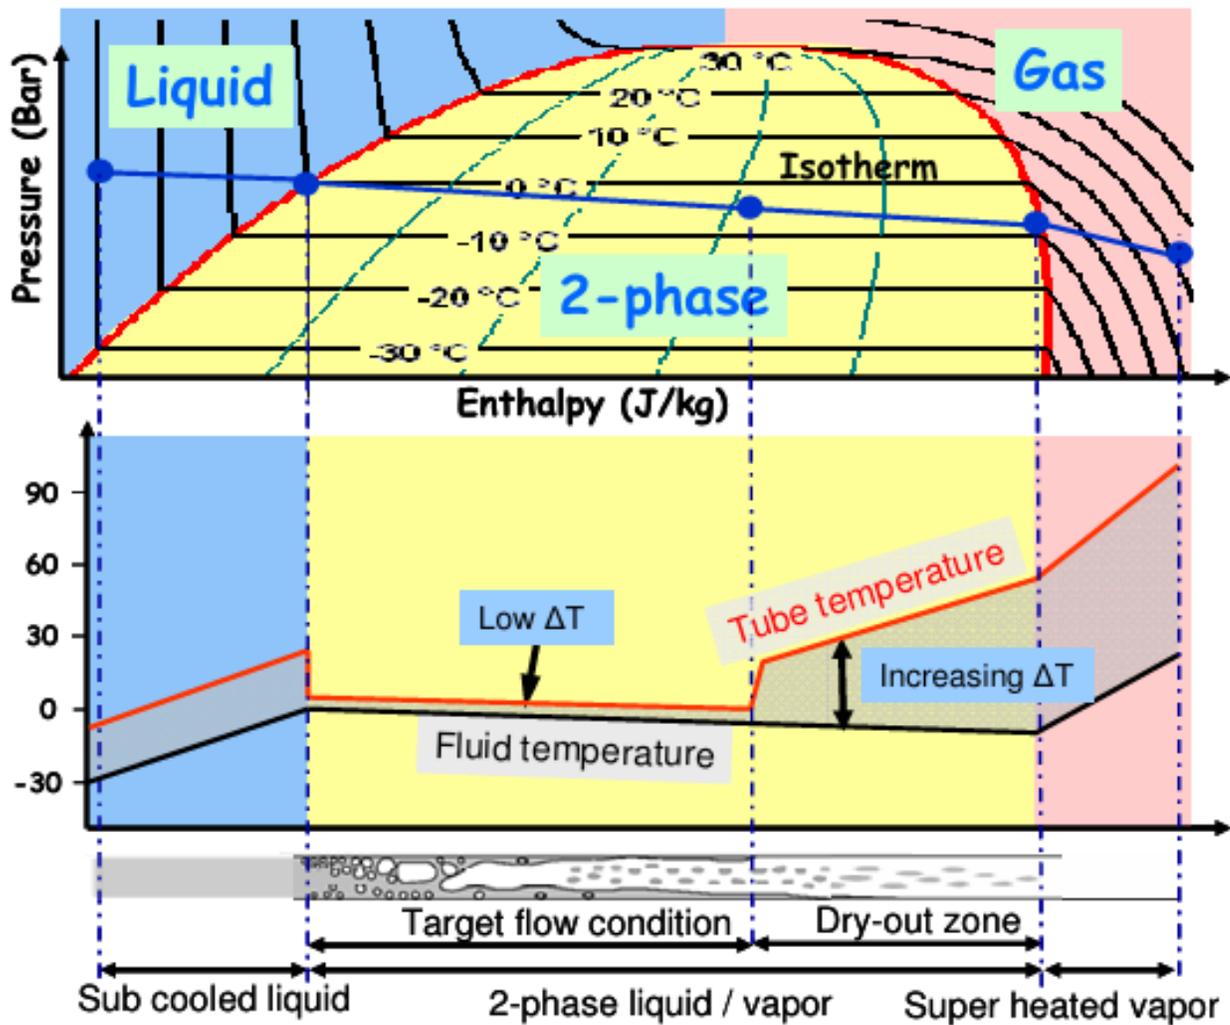

→ 零臭氧层破坏 (ODP=0) → 比CFC制冷剂更可持续

常见抗辐射制冷剂

一定流速下压降与管径的关系

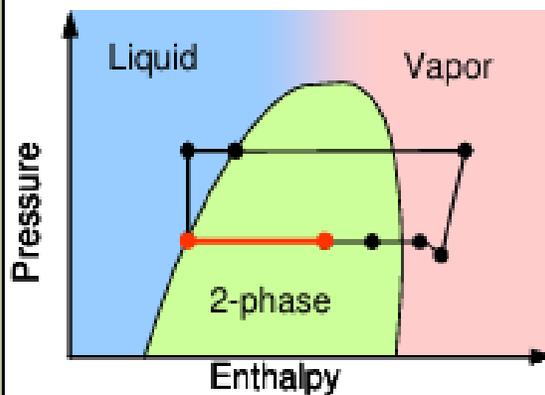

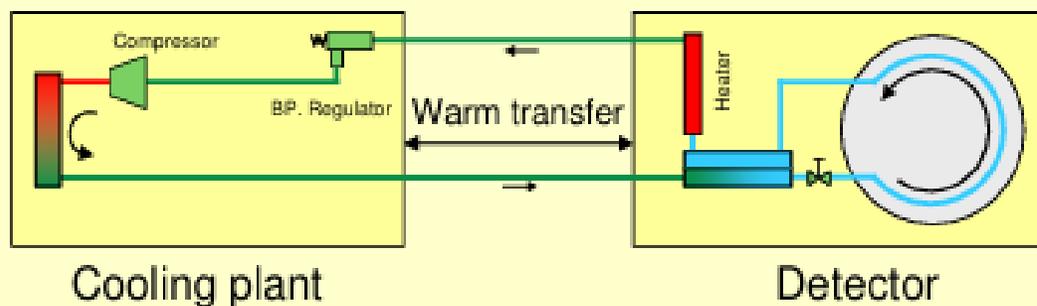

CO<sub>2</sub>压力焓图

黑线是流体温度，红线是管壁温度

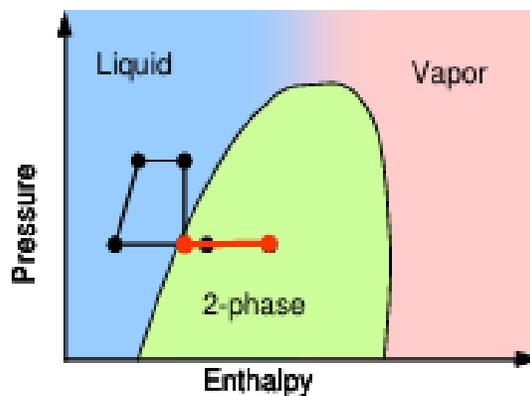

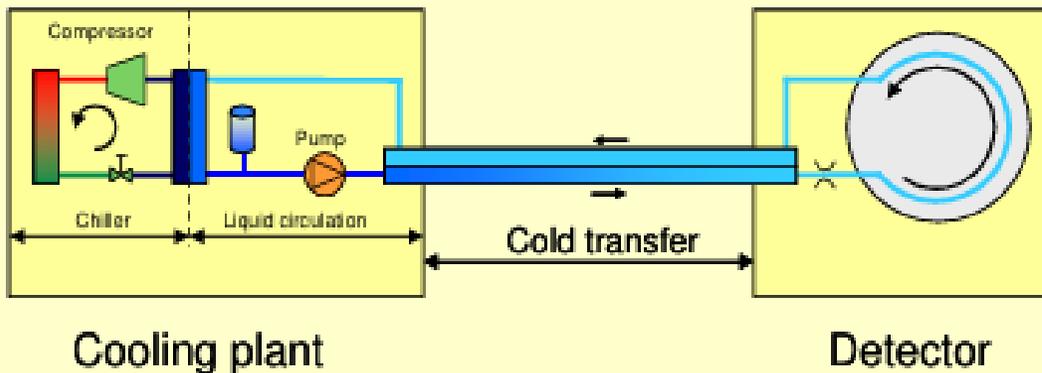

## Traditional method: Vapor compression system

(Atlas)

## 2PACL method: Pumped liquid system

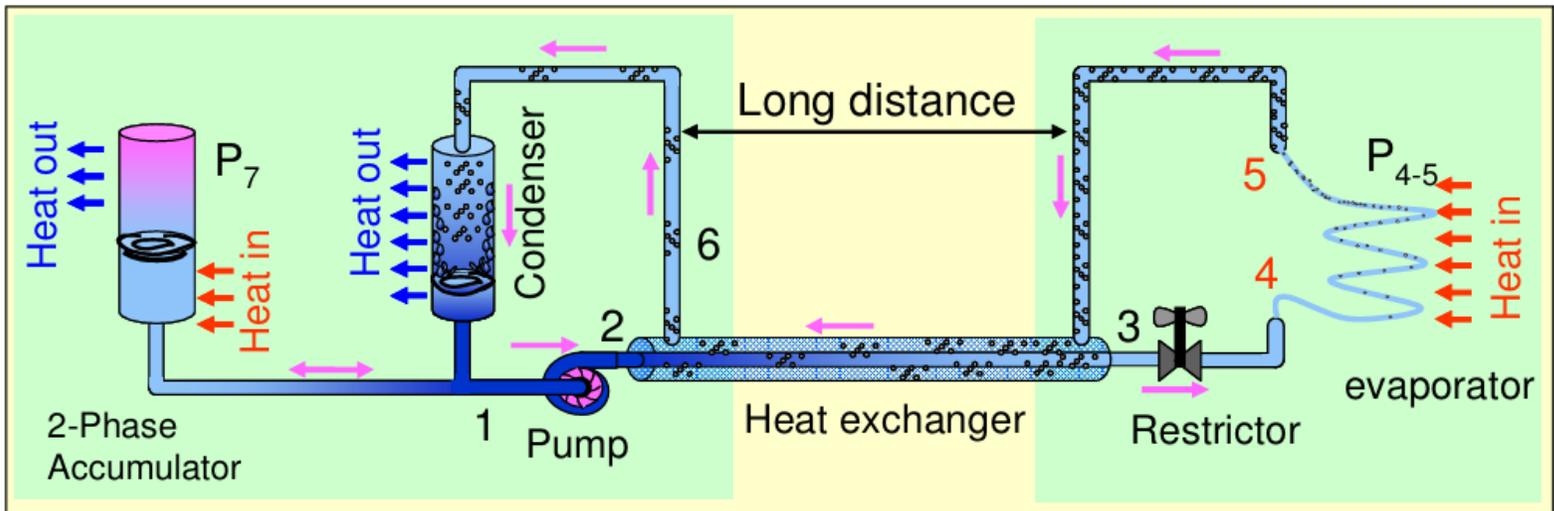

(LHCb)

传统压缩系统的优点在于可以使用温暖的运输管线；而泵送系统则需要冷却传输管道并且需要适当的绝缘层。绝缘层会增加额外的空间需求，但管道较小，因此所涉及的质量很可能较低。

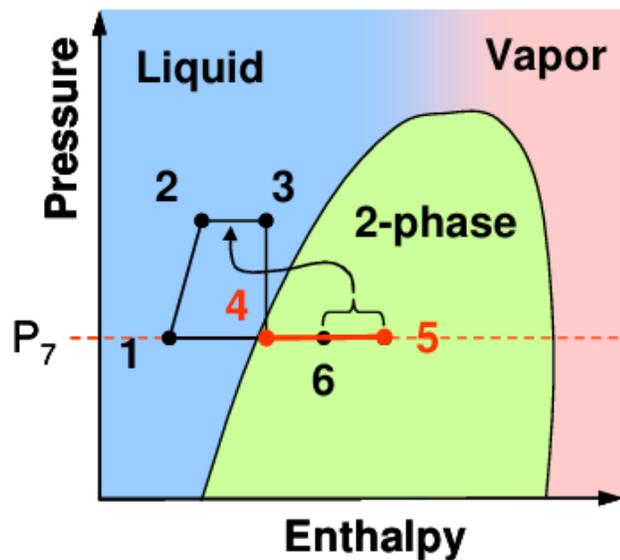

传统压缩系统的缺点是探测器内存在加热器，以蒸发剩余的液体，同时需要无油压缩机比无油泵通常更难找到。两相蓄能器泵送方法的主要优点是探测器内部有一个完整的被动蒸发器部分。在难以接触的探测器区域，不需要执行器或重要传感器。

# 二氧化碳两相蓄能器泵送系统 (2PACL)

•蓄能器：与系统并联，始终包含液态和气态CO<sub>2</sub>的饱和混合物。蓄能器温度直接决定系统饱和压力（即蒸发温度）。

•关键组件：泵、内部热交换器、蒸发器、冷凝器、蓄能器。

# 二氧化碳两相冷却控制系统

CERN开发的标准化工业控制系统框架，集成SCADA、PLC和现场层设备，支持模块化编程与自动化代码生成

## Detector Cooling CO<sub>2</sub> at CERN

### TRACI

- ~ 20 I/Os
- Siemens PLC or NI DAQ
- Portable
- 7 units in operation
- 2 unit in assembly phase

### CMS @ P5

- ~700 I/Os
- Schneider Premium PLC
- Portable
- 2 redundant systems
- Under final commissioning

### CMS TIF

- ~240 I/Os
- 1x Schneider PLC
- UNICOS framework
- WinCC OA - SCADA
- In operation

### ATLAS IBL

- ~670 I/Os
- 3x Schneider PLCs
- UNICOS framework
- WinCC OA - SCADA
- In operation
- Under EN-CV M&O

### CORA

- ~70 I/Os
- 1x Siemens PLC
- UNICOS framework
- WinCC OA - SCADA
- In operation

### MARCO

- ~110 I/Os
- 1x Siemens PLC
- UNICOS framework
- WinCC OA - SCADA
- Local HMI
- Movable
- In operation

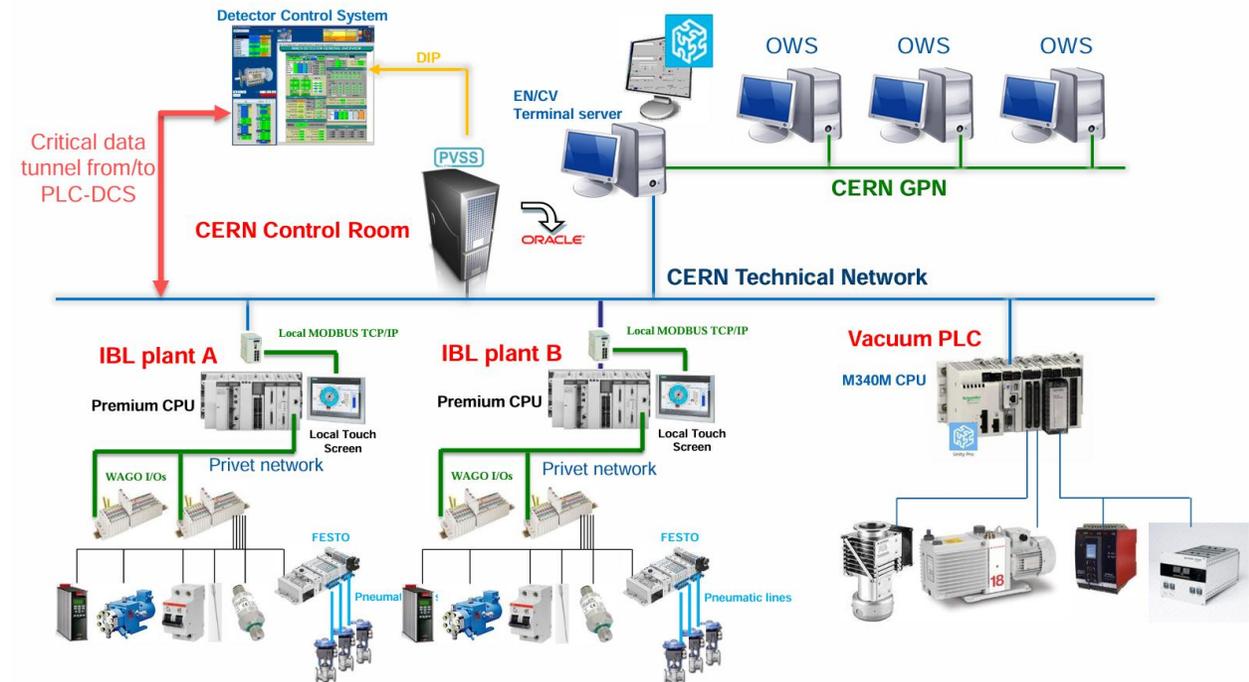

### SR1

- ~140 I/Os
- 1x Schneider PLC
- UNICOS framework
- WinCC OA - SCADA
- In operation

Controls for CO<sub>2</sub> cooling @ CERN

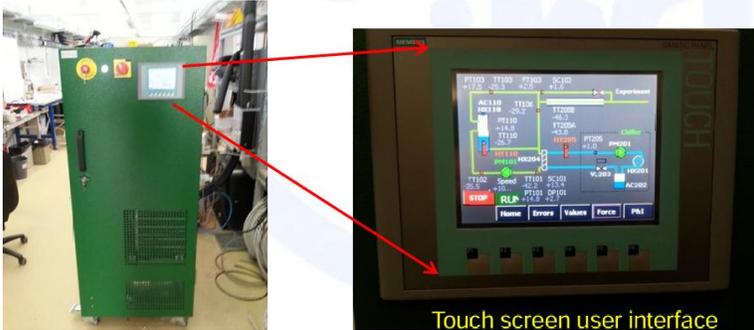

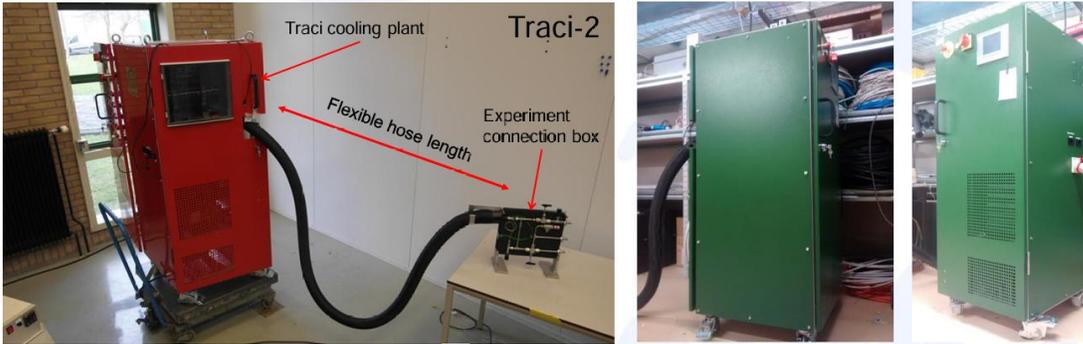

## IBL CO<sub>2</sub> cooling control system architecture

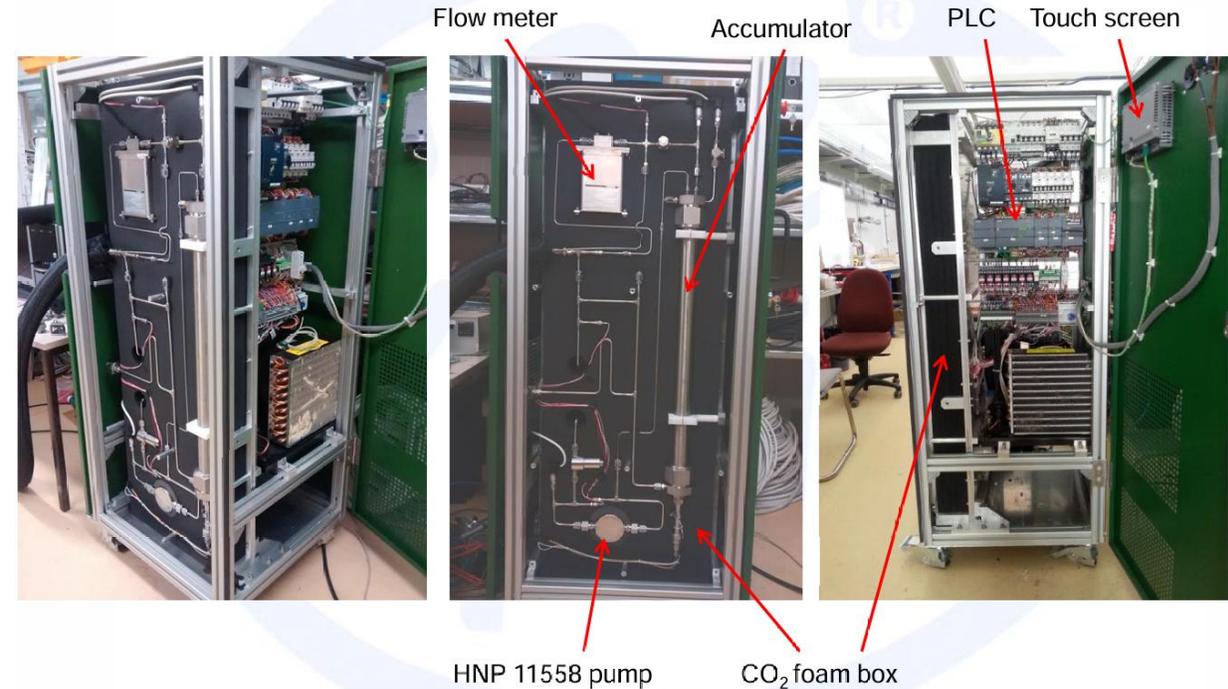

# Traci

## Traci-3 update features

- Traci-3 has been updated wrt Traci-2
  - PLC + touchscreer control
  - HNP-ceramic pump
- Traci-3 build from a revised design
  - Serial production oriented

## Traci-3 internal

# Traci

## 实验对象:

CMS Outer Tracker的CO<sub>2</sub>冷却管道系统，重点测试TB2S ladders串联结构的温度分布及预热器性能。

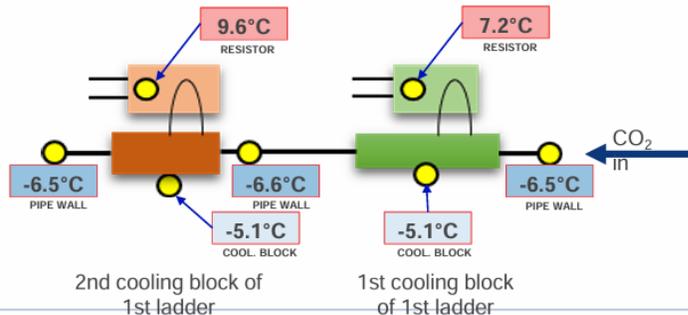

## 核心目标:

- 评估CO<sub>2</sub>两相流在低温条件下的热传递效率。
- 验证预热器对液态CO<sub>2</sub>向两相流转换的作用。
- 识别冷却系统的潜在问题（如干燥现象、热接触不良）

## Results – “Module” Temperatures

- Comparison of measured temperatures on the pipe wall, on the cooling blocks and on the resistor plates with 2W per resistor.
- Cooling blocks close in temperature to the pipe wall ( $\Delta T_{\max} = 1.5^\circ\text{C}$ ).
- Resistors hotter than cooling block ( $\Delta T_{\max} = 14.7^\circ\text{C}$ ).
- Thermal paste was used (DC 340), however it may be interesting exploring this thermal contact further.

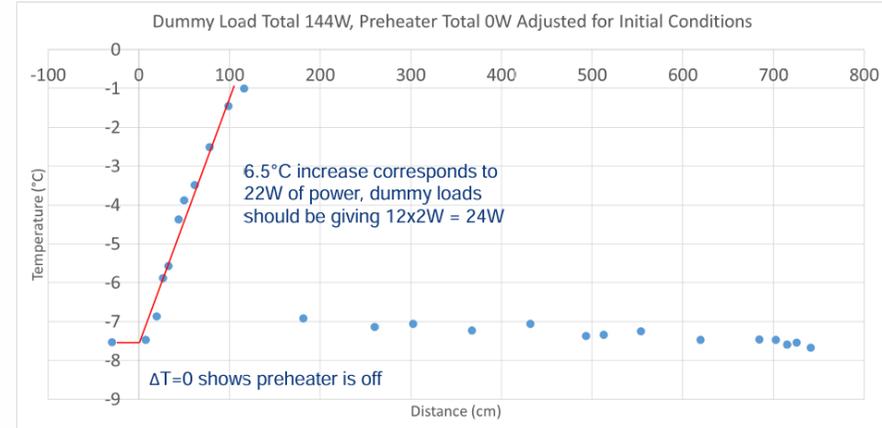

CO2 Set Point	28 bar (-8 °C)
Dummy Load Power	144 W
Preheater Power	10 W
Flow	1.44 g/s

## Results – Dummy Loads Only

- Superheating visible,  $\Delta T$  consistent with fully liquid flow, before sudden transition.

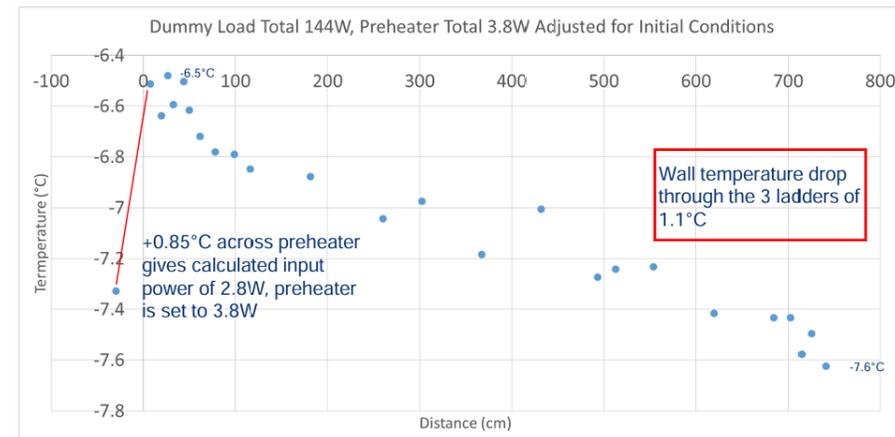

CO2 Set Point	28 bar (-8 °C)
Dummy Load Power	144 W
Preheater Power	0 W
Flow	1.44 g/s

## Results – Preheater Turned On

- Two phase flow after preheater, with 1.1°C temperature drop due to pressure drop.
- Power of 148W gives  $\approx 40\%$  vapour quality.

CO2 Set Point	28 bar (-8 °C)
Dummy Load Power	144 W
Preheater Power	3.8 W
Flow	1.44 g/s

## 目前两相流仿真需要完善的地方：

正确定义因压降而变化的沸腾温度

需要的计算资源更多，对计算性能要求更高

## 下一步工作计划：

做一个类似于Traci的小型二氧化碳冷却样机进行二氧化碳两相流实验
