

$$\frac{d\sigma}{dT} = \frac{G_F^2}{4\pi} Q_W^2 M \left(1 - \frac{MT}{2E_\nu^2}\right) F(Q^2)^2.$$

$$Q_W = N - (1 - 4\sin^2\theta_W)Z$$

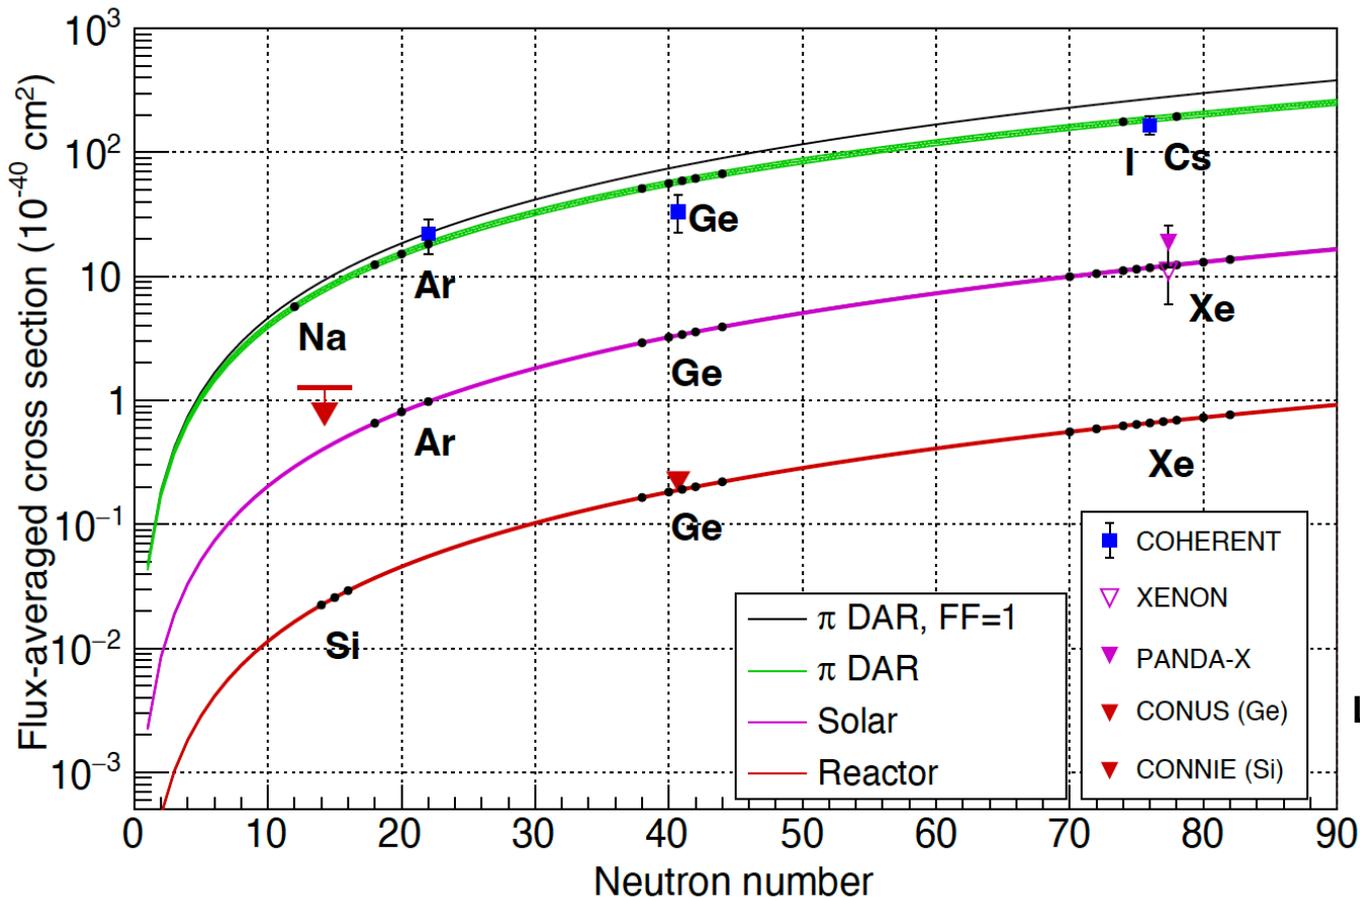

$$Q_W \propto N \implies \frac{d\sigma}{dT} \propto N^2$$

## Compare with IBD:

- ✓ Cross-section 100x → compact
- × Energy 0.1% → low-threshold
- ✓ No interaction energy threshold
- × No coincidence, recoil-based
- ✓ Complementary physics  
particle, astrophysics...

# $^8\text{B}$ Search: Win with Lower Threshold

Most  $^8\text{B}$  CE $\nu$ NS below **3-fold WIMP** threshold:

- **S1** coincidence PMTs: lower to **2-fold**
- **S2** = (120,500) PE  $\simeq$  (4,17) electrons

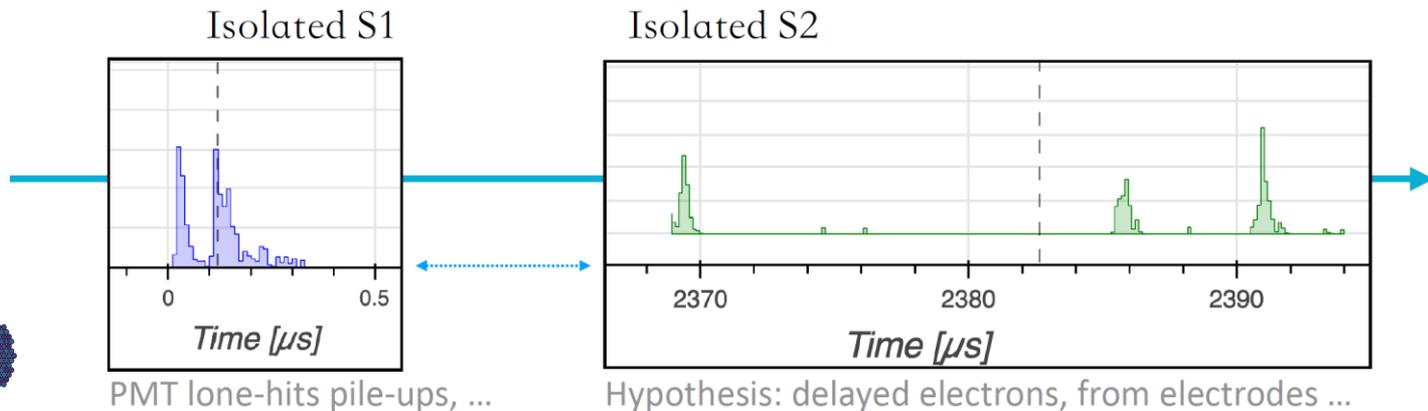

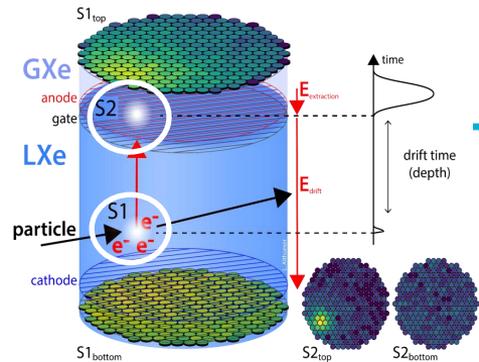

## Acceptance with data-selection embedded

- **~20x** higher  $^8\text{B}$  CE $\nu$ NS signal
- ? higher background

# Challenge 1: Accidental Coincidence (AC)

i.e., incorrectly paired S1 and S2

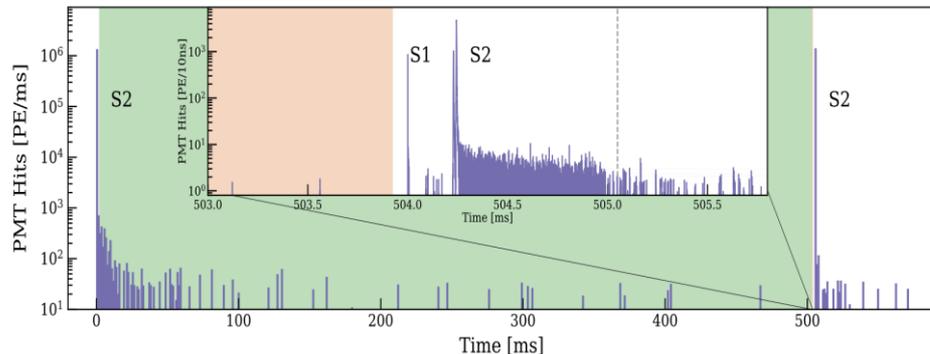

$$Count_{AC} = \int_{t_0}^{t_1} R_{S1}(t) \times R_{S2}(t) \times T_{max} dt$$

15 Hz      2.2 ms  
0.15 Hz

Before suppression ~ 400/day ☹️

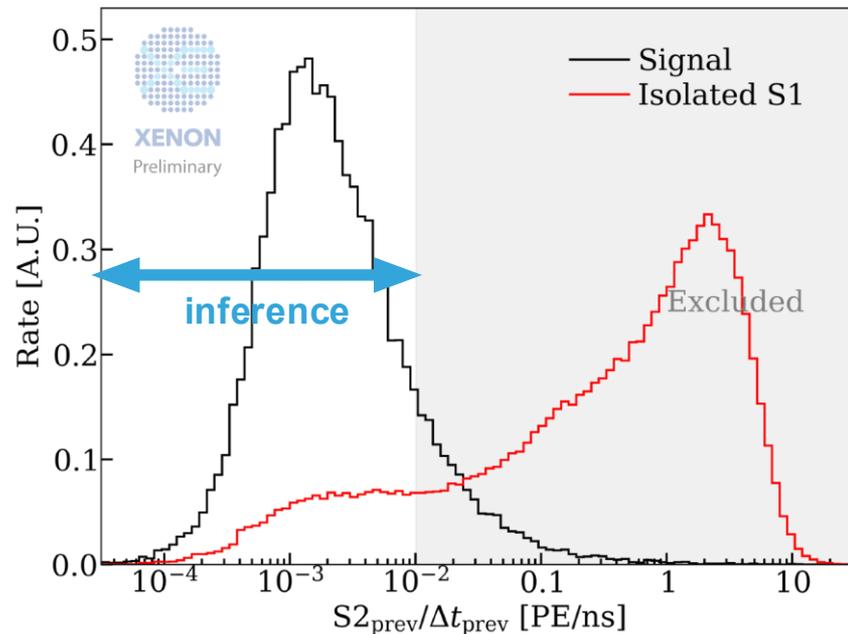

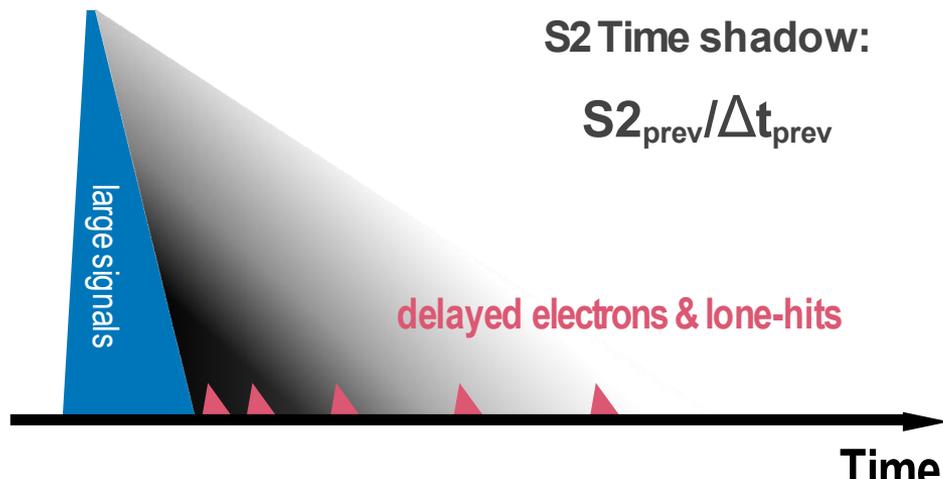

# AC removal: High Energy Correlation

XeTPCs have low-energy signals following high-energy peaks → time correlation

S2 Time shadow:

$$S2_{\text{prev}} / \Delta t_{\text{prev}}$$

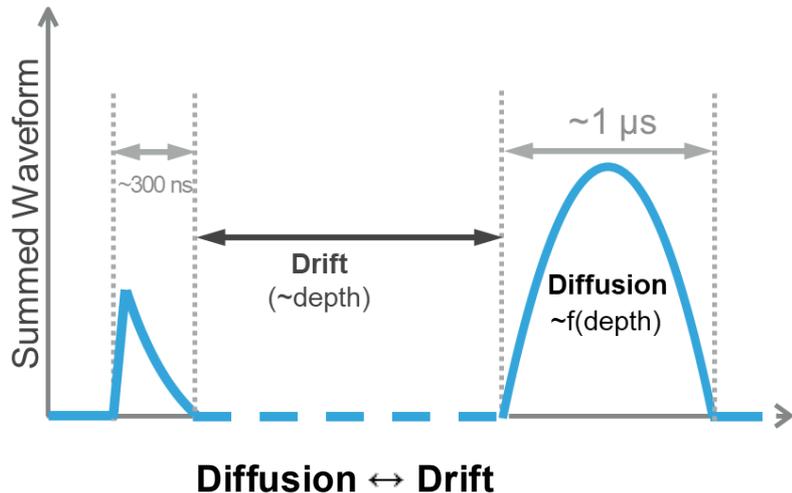

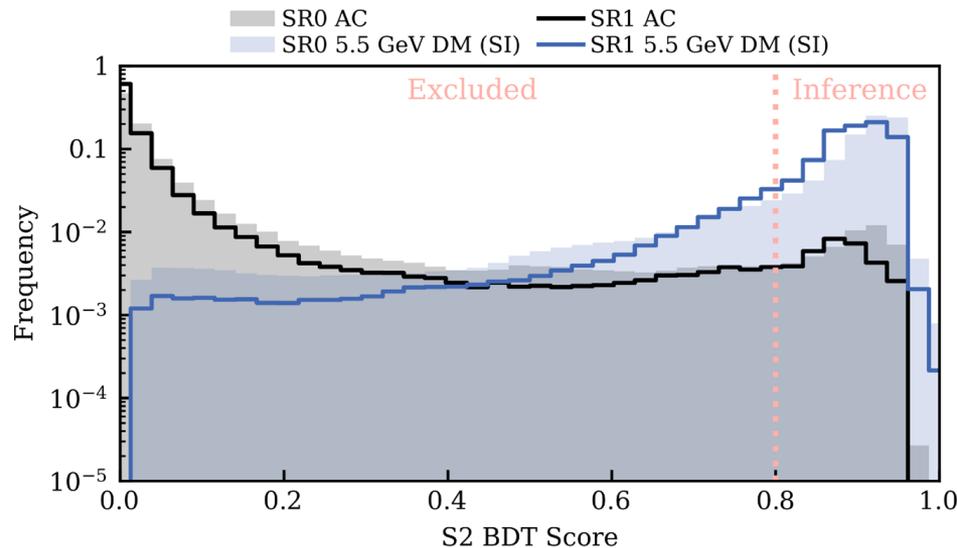

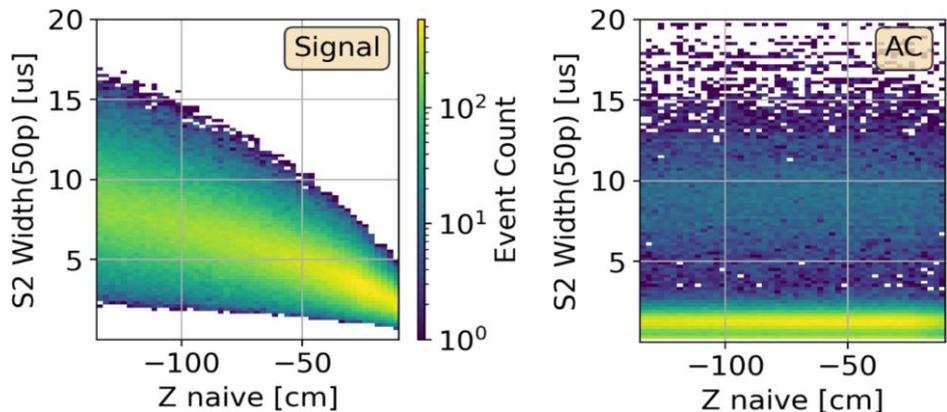

- Exposure remain = 80%
- Data-driven simulation verified with calibration
- “Isolated” S1/S2 suppressed by **1-2 orders**

“Isolated” S1  
15 Hz → **2.3 Hz**

“Isolated” S2  
150 mHz → **25 mHz**

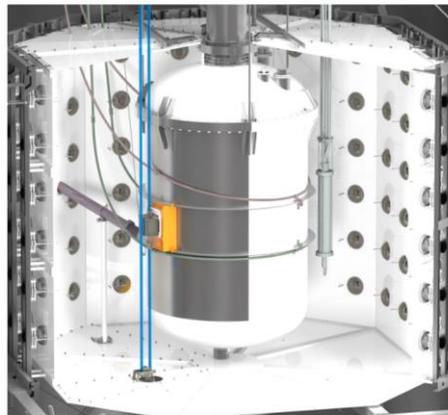

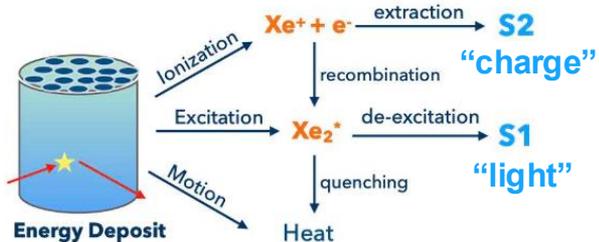

# AC removal: Waveform Learning

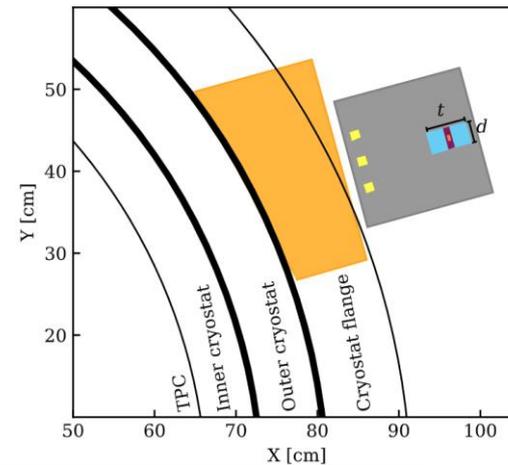

## Boosted Decision Tree Machine

- Learning waveform features
- Electrons diffuse over the drift
- Reject **90%** AC, retain **80%** signal

# Challenge 2: Low-energy Response

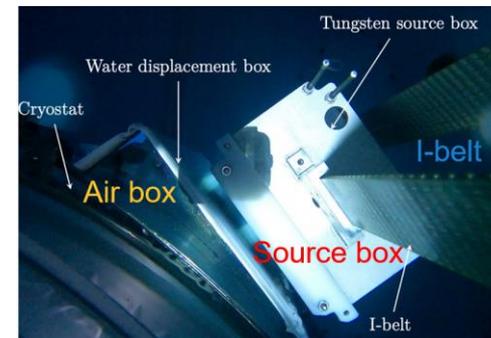

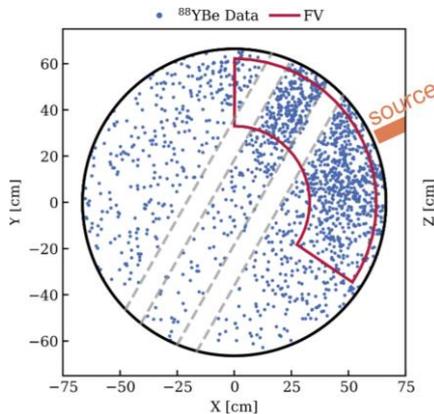

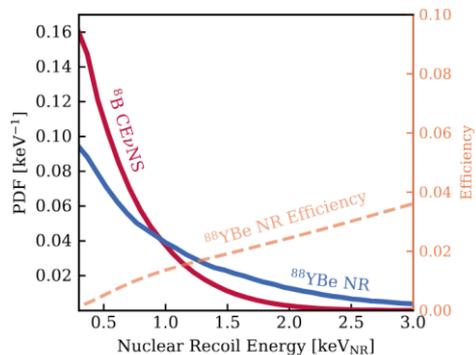

2502.18005

## YBe neutron calibration

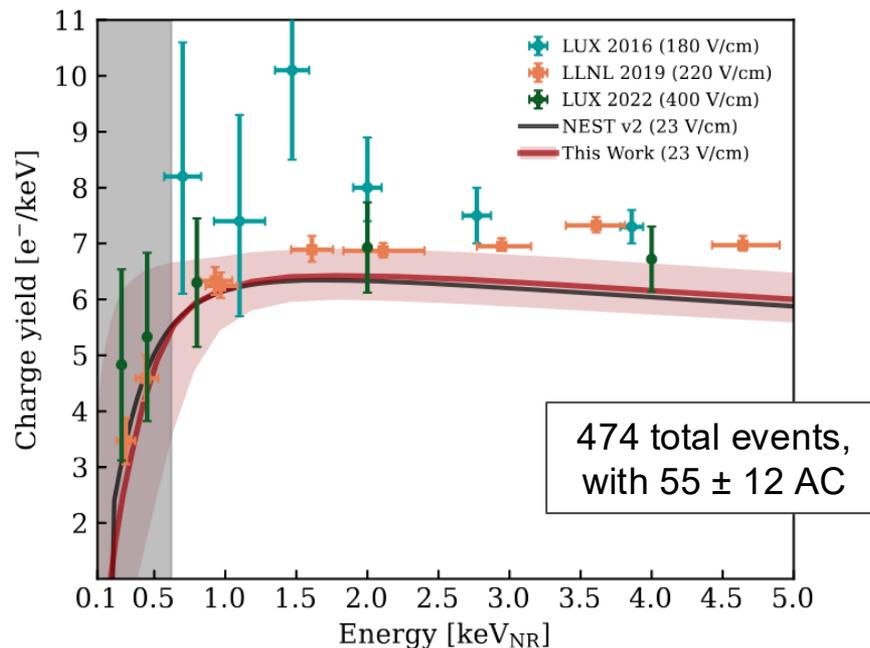

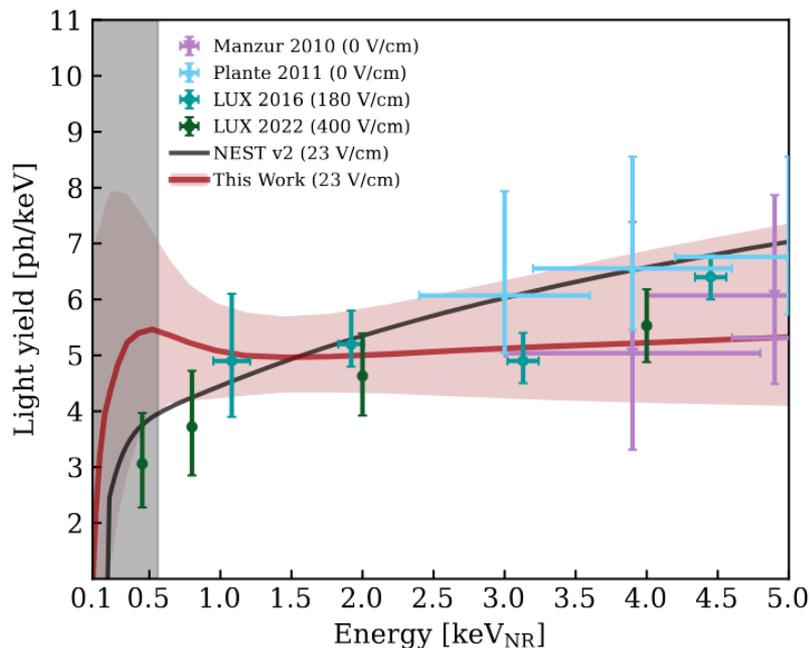

- Measure light/charge yields  $\sim 1 \text{keV}_{NR}$
- Demonstrate low-energy detection

YBe source:  $\gamma + {}^9\text{Be} \rightarrow n + {}^8\text{Be}$

Deployed near TPC with tungsten gamma-shielding

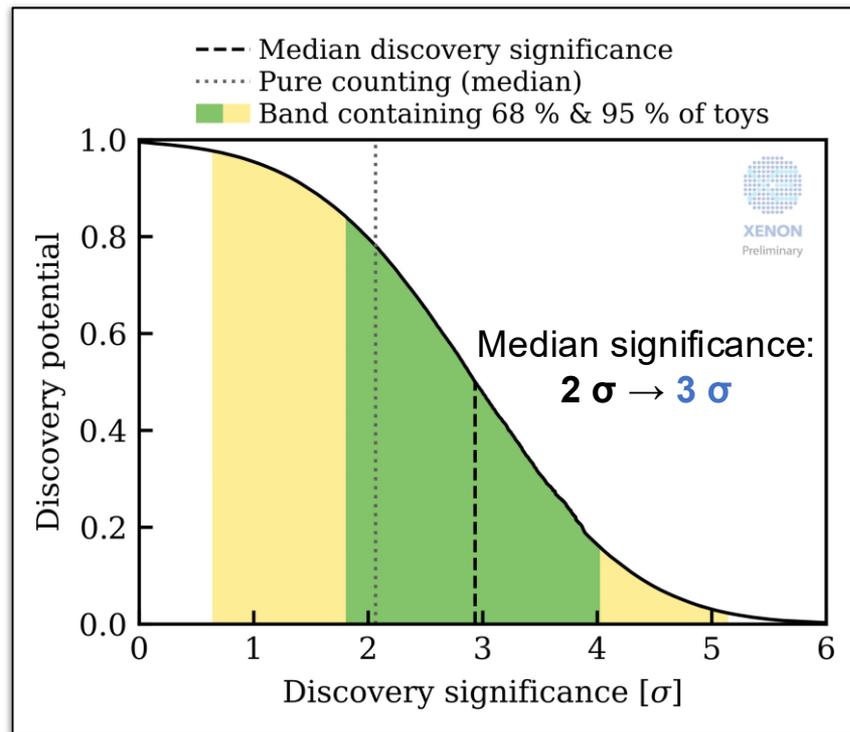

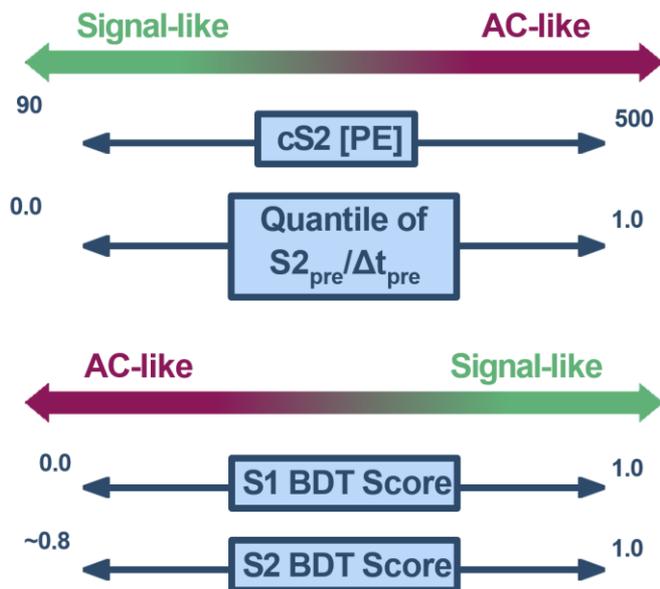

# Signal: Emission model from YBe

- Demonstration to extract **signal near 0.5 keV**
- Extracted light and charge **yields**
- **35% uncertainty** for <sup>8</sup>B CEvNS model

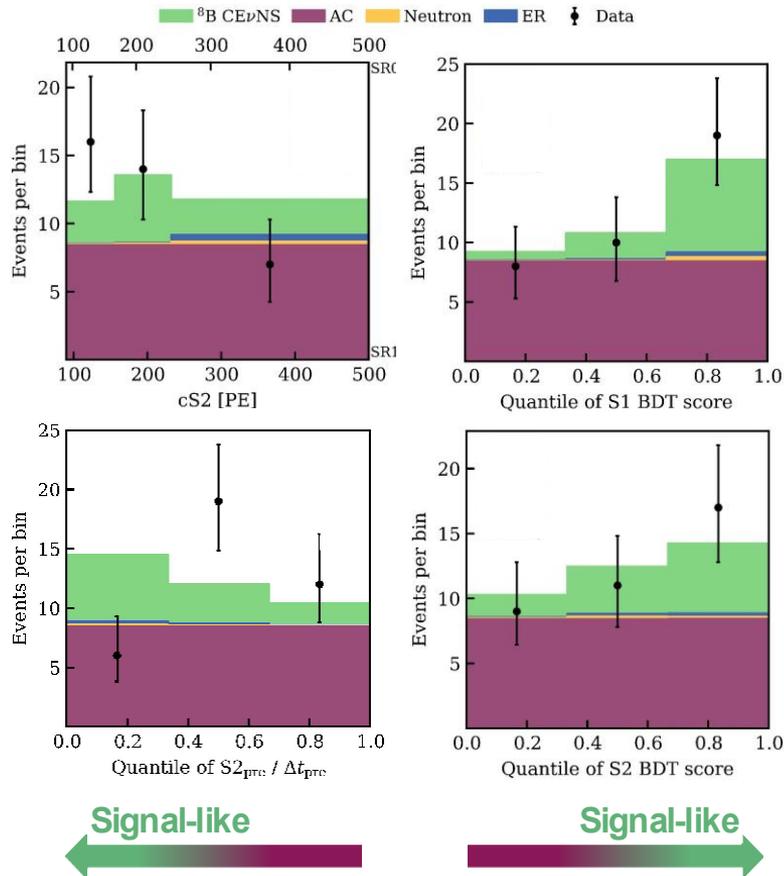

# XENON $^8\text{B}$ Sensitivity

- Extended binned likelihood
- New analysis dimensions
- Constraints on YBe yield model

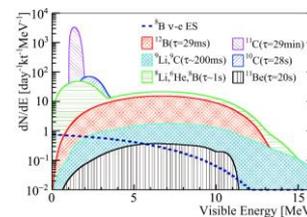

Feature extraction  $\leftrightarrow$  Improved sensitivity

# $^8\text{B}$ CEvNS Results

# RELICS Signal and Backgrounds

Cosmic-ray neutron  
• Shielding

Muon-related delay electron

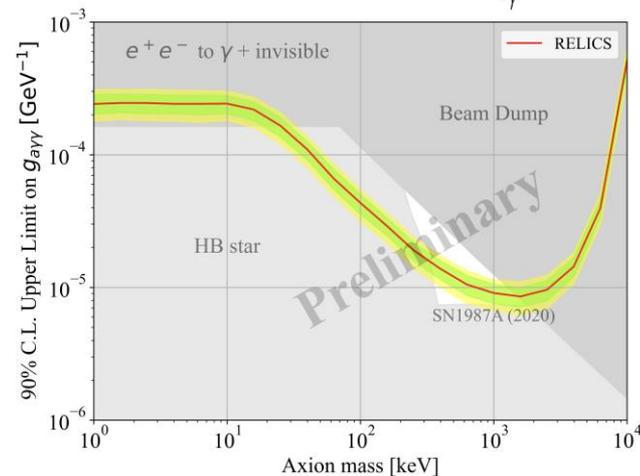

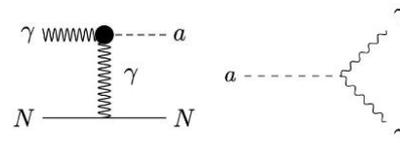

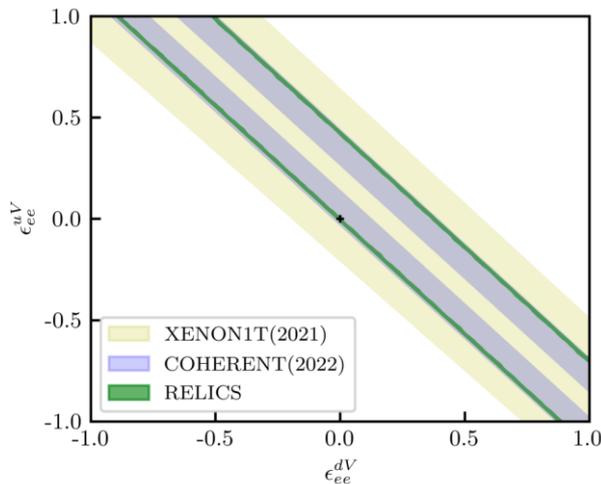

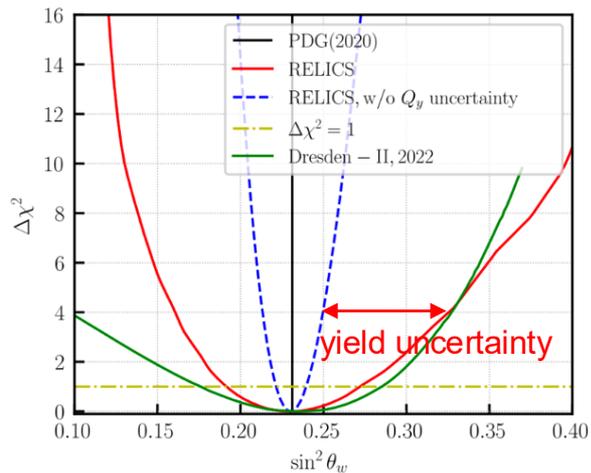

- Correlation cuts
- Waveform

- ~5000 CEvNS with 30kg-year exposure @25m baseline
- ~1500 backgrounds in the same exposure, cosmic-ray related
- Active + passive shielding needed for suppression

# RELICS Sensitivities

$$\sin^2 \theta_W(\mu) = \frac{g'^2(\mu)}{g^2(\mu) + g'^2(\mu)}$$

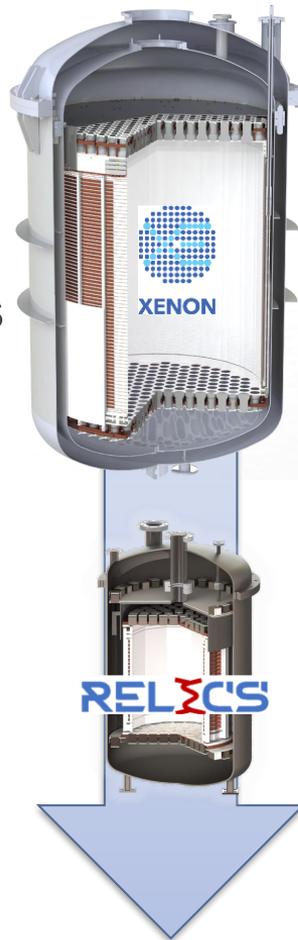

$$\frac{d\sigma}{dE_R} = \frac{G_F^2 \cdot m_t}{2\pi} F^2(2m_t E_R) \left[ 2 - \frac{m_t E_R}{E_\nu^2} \right] \times \left[ Z(g_V^p + 2\epsilon_{ee}^{uV} + \epsilon_{ee}^{dV}) + N(g_V^n + \epsilon_{ee}^{uV} + 2\epsilon_{ee}^{dV}) \right]^2$$

- Weak mixing angle at low- $Q^2$
- Non-standard neutrino interactions
- Axion coupling to gamma (reactor ALP)

# Summary

- CEvNS is complementary to IBD, c.f., Jiajun's talk
- Xe TPCs are advantageous in cross-section
- Three ton-scale Xe TPCs saw CEvNS from solar  $^8\text{B}$  neutrinos
- kg-scale Xe TPC will measure reactor CEvNS cross-section with high-flux and low-Q

Ultimate CEvNS detector

## Technology maturity

20 years of development  
 Purification; Rn/Kr distillation  
 Accidental suppression

## Shared bottleneck/systematic

Delayed electron  
 Detector response (lowE yields)
