# updates from huijun

WWyy

bkg component check

- something was wrong in the dumper->reruned
- the drop in the fist two bins are due to the high threshold in generation
- additional check is done by enuyy sample

WWyy

- theoretical systematic
- first we need to raise the statistic by 10 times (this may need one week)
- then I will test both smeared rec_branches and mc_branches to see which is more resonable

Higgs prospect

- the full smearing package is done -> call also be used on WWyy theoretical uncertainties

- Maosen is working on optimizing the mva selection

- More samples were required to central production
