IP RMS horizontal beam size	$\sigma_x^*$	nm	729.0	683.5	474	474	481	335
IP RMS vertical beam size	$\sigma_y^*$	nm	7.7	5.9	5.9	5.9	2.8	2.7
Luminosity	$L$	$\times 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$	0.75	1.0	1.8	3.6	3.6	4.9
Fraction of luminosity in top 1%	$L_{0.01}/L$		87.1%	77.4%	58.3%	58.3%	59.2%	44.5%
Average energy loss	$\delta_{BS}$		0.97%	1.9%	4.5%	4.5%	5.6%	10.5%
Number of pairs per bunch crossing	$N_{pairs}$	$\times 10^3$	62.4	93.6	139.0	139.0	200.5	382.6
Total pair energy per bunch crossing	$E_{pairs}$	TeV	46.5	115.0	344.1	344.1	1338.0	3441.0

Note there are two types of upgrades:

**Luminosity upgrade:** Install extra klystrons and modulators so number of bunches can be doubled; envisioned after 8 years of baseline running

**Energy upgrade:** Increase accel. gradient, lengthen linac, or both. TDR config assumes 49 km. length; envisioned after 20 years of running

# Luminosity Upgrade for $E_{cm}=250$ GeV

			Baseline ILC	Lumi Upgrade
Center-of-mass energy	$E_{CM}$	GeV	250	250
Collision rate	$f_{rep}$	Hz	5	10
Electron linac rate	$f_{linac}$	Hz	10	10
Number of bunches	$n_b$		1312	2625
Pulse current	$I_{beam}$	mA	5.8	8.75
Average total beam power	$P_{beam}$	MW	5.9	21
Estimated AC power	$P_{AC}$	MW	129	200
Luminosity	$L$	$\times 10^{34} \text{ cm}^{-2}\text{s}^{-1}$	0.75	3.0

The  $\sqrt{s} = 250$  GeV lumi is quadrupled by doubling the number of bunches *and* the collision rep rate

The 10 Hz operation which in the baseline was split between 5 Hz collision and 5 Hz  $e^+$  production is now 100% collision in the lumi upgrade config. A longer undulator should be ready that can produce sufficient  $e^+$  yield with 125 GeV electrons

Note the AC power is 200 MW, the same as the 5 Hz lumi upgrade power at  $\sqrt{s} = 500$  GeV.

Also note that ILC produces  $3 \times 10^{34} \text{ cm}^{-2}\text{s}^{-1}$  luminosity with 200 MW total AC power.

# Full Simulation Performed with ILD and/or SiD Detector

# SiD Global Parameters

Detector	Technology	Radius (m)		Axial (z) (m)	
		<i>Min</i>	<i>Max</i>	<i>Min</i>	<i>Max</i>
Vertex Detector	Pixels	0.014	0.06		0.18
Central Tracking	Strips	0.206	1.25		1.607
Endcap Tracker	Strips	0.207	0.492	0.85	1.637
Barrel Ecal	Silicon-W	1.265	1.409		1.765
Endcap Ecal	Silicon-W	0.206	1.25	1.657	1.8
Barrel Hcal	RPCs	1.419	2.493		3.018
Endcap Hcal	RPCs	0.206	1.404	1.806	3.028
Coil	5 tesla	2.591	3.392		3.028
Barrel Iron	RPCs	3.442	6.082		3.033
Endcap Iron	RPCs	0.206	6.082	3.033	5.673

Combining barrel and endcaps these trackers and calorimeters cover  $|\cos \theta| \leq 0.99$

LumiCal and BeamCal are used for  $|\cos \theta| > 0.99$

Pulsed power is possible due to low duty cycle 5 Hz rep rate: eliminates need for cooling

# Construct 500 GeV from start

- 500 GeV scenarios study
  - TDR Baseline
  - Emphasizes higher energy - strength of ILC
- Study parameters
  - assume 20 years of operation
  - compare 3 scenarios (studied more)
    - G20, H20, I20
  - Snowmass white paper studied also for comparison
    - arXiv:1310.0763 [hep-ph]

# Assumptions

- Full calendar year is assumed to be 8 months at a 75% efficiency (the RDR assumption). This corresponds to  $Y = 1.6 \times 10^7$  seconds of integrated running. (significantly higher than a Snowmass year of  $10^7$  seconds.)
- A **ramp-up** of luminosity performance is in general assumed after:
  - (a) initial construction and after 'year 0' commissioning;
  - (b) after a downtime for a luminosity upgrade;
  - (c) a change in operational mode which may require some learning curve (e.g. going to 10-Hz collisions).
- For initial physics run *after construction and year 0 commissioning*, the RDR ramp of 10%, 30%, 60% and 100% is assumed over the first four years.
- The ramp *after the shutdowns for installation of the luminosity upgrade* is assumed slightly shorter (10%, 50%, 100%) with no year 0.
- *Going down in centre of mass energy* from 500 GeV to 350 GeV or 250 GeV is assumed to have no ramp, since there is no machine modification.
- *Going to 10-Hz operation at 50% gradient* does assume a ramp (25%, 75%, 100%), since 10-Hz affects the entire machine.
- A major 18 month shutdown is assumed for the luminosity upgrade.
- Unlike TDR: 10-Hz and 7-Hz operation assumed at 250 GeV and 350 GeV

# Preferred Scenario

	$\sqrt{s}$	$\int \mathcal{L} dt$	$L_{\text{peak}}$	Ramp				$T$	$T_{\text{tot}}$	Comment
	[GeV]	[fb <sup>-1</sup> ]	[fb <sup>-1</sup> /a]	1	2	3	4	[a]	[a]

500 GeV	500 fb <sup>-1</sup>	3500 fb <sup>-1</sup>	4 ab <sup>-1</sup>	1.6 ab <sup>-1</sup>
time	8.1 yrs	10.6 yrs	20.2 yrs*	

\* includes 1.5 years for luminosity upgrade

† ILC Higgs whitepaper: arXiv:1310.0763

# Top Physics and New Particle Searches at $\sqrt{s} \geq 350$ GeV

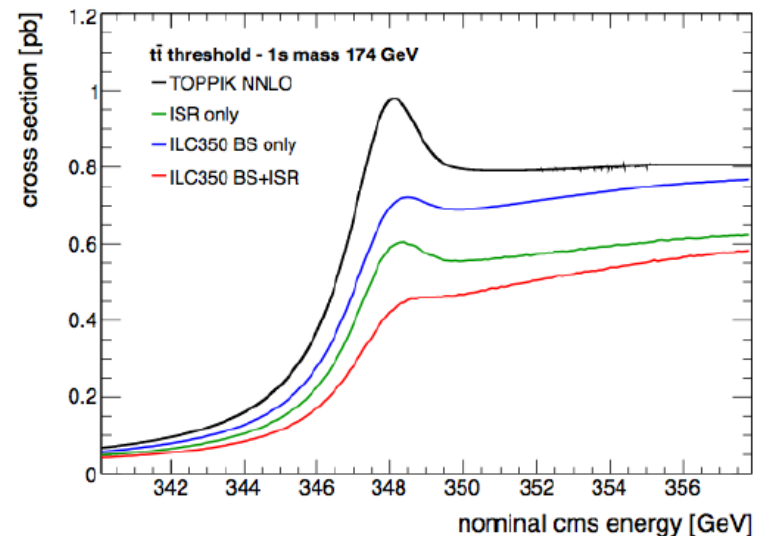

# Top mass from an LC threshold scan

Threshold shape depends strongly on mass, width. Normalization sensitive to strong coupling constant and top Yukawa coupling.

*Kuhn, Acta Phys. Polon. B12 (1981) 347*

Beam energy spread and ISR smear the shape

# Top quark mass: summary

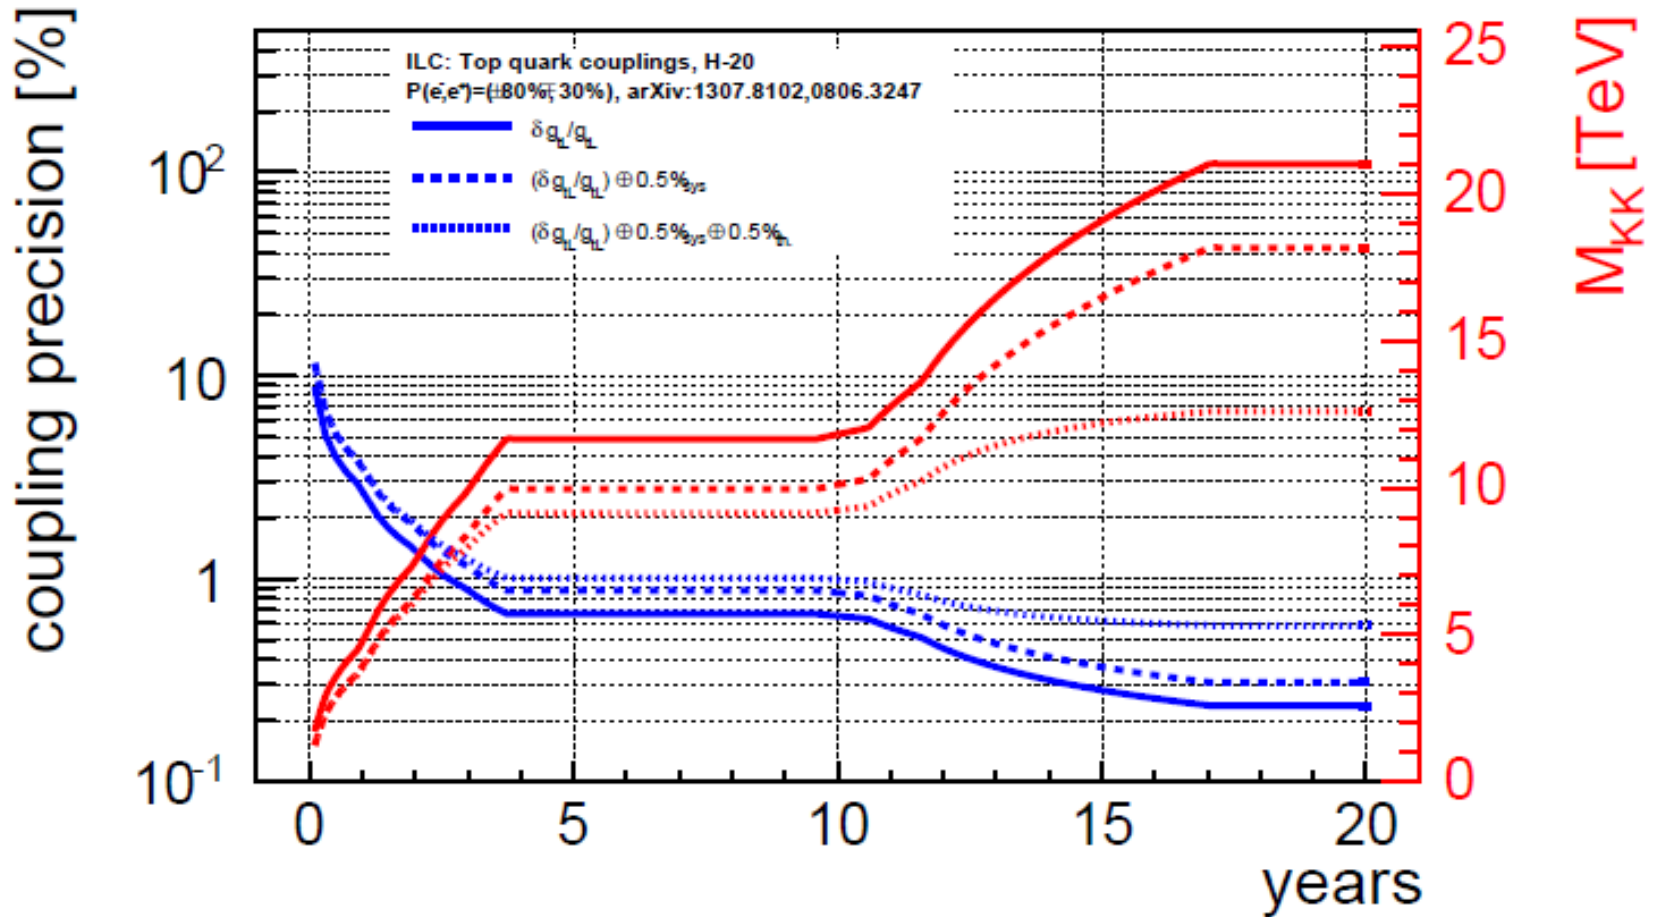

**A very precise measurement of the top quark mass,  $\Delta m_t \sim 50$  MeV, can be extracted from a threshold scan**

**+  $\Delta \alpha_s < 0.001$  (not competitive with world average)**

**+  $\Delta \Gamma_t < 30$  MeV (translate to constraint on  $V_{tb}$ )**

**+  $\Delta y_t/y_t \sim 4.2\%$  (if a precise value of  $\alpha_s$  is inserted, otherwise 35%)**

# Time Evolution of Left-handed Top Coupling & $M_{KK}$ Limit

# ILC BSM Physics (SUSY and Dark Matter)

ArXiv:1308.1461, M.Berggren

Loop-hole free, model-independent sensitivity down to very small mass differences

# Mono-Photon WIMP prospects at the ILC

90% CL, Vector operator (D5)

# EW Precision Measurements at $\sqrt{s} = 91$ & 160 GeV

$$\sqrt{s} = 90, 160 \text{ GeV}$$

Currently no ILC design for  $\sqrt{s} = 90, 160 \text{ GeV}$ . Not easy to run the ILC at these energies.

e.g. 150 GeV (125 GeV)  $e^-$  beam needed for positron production in baseline (lumi upgrade) design.

A reasonable design goal might be  $L=5 \times 10^{33}$  @ 91 GeV and  $L=1 \times 10^{34}$  @ 160 GeV in the lumi upgrade config.

This would provide  $\int L dt = 100 \text{ fb}^{-1}$  @ 91 GeV in 8 mos. and  $\int L dt = 200 \text{ fb}^{-1}$  @ 160 GeV in 8 mos.

# EW Precision Measurements with CEPC & ILC

	CEPC	ILC
	91 +160 GeV 100 + 500 fb <sup>-1</sup>	91 + 160 GeV 100 + 200 fb <sup>-1</sup>
$\Delta A_{LR}$	–	$1 \times 10^{-4}$
$\Delta \sin^2 \theta_W^{eff}$	$2.7 \times 10^{-5}$	$1.3 \times 10^{-5}$
$\Delta M_Z$	0.5 MeV	1.6 MeV
$\Delta \Gamma_Z$	0.5 MeV	0.5 MeV
$\Delta \alpha_s(M_Z^2)$	$1.0 \times 10^{-4}$	$5.0 \times 10^{-4}$
$\Delta N_\nu$	0.001	0.004
$\Delta A_b$	–	0.001
$\Delta R_b \equiv \Delta \frac{\Gamma_b}{\Gamma_{had}}$	$1.7 \times 10^{-4}$	$1.4 \times 10^{-4}$
$\Delta R_l \equiv \Delta \frac{\Gamma_{had}}{\Gamma_l}$	0.007	–
$\Delta M_W$	2.5 MeV	4 MeV

*Note* : This is probably the maximum integrated luminosity at these energies during the lifetime of the ILC. On the other hand CEPC can readily accumulate much more luminosity at these energies.

# Higgs Physics

# ILC Measurement of $\sigma(e^+e^- \rightarrow ZH)$      $\sqrt{s} = 250$ GeV

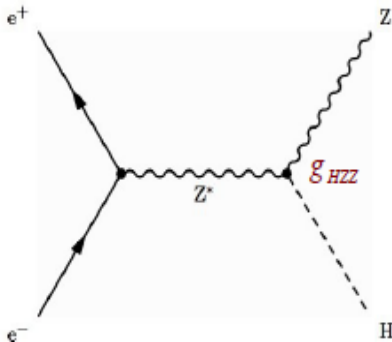

## Higgs Recoil Measurement of Higgs Mass and Higgstrahlung Cross Section

**Very Precise Measurement**  
S/B = 8 in Peak Region

**Less Precise**  
Bremsstrahlung in detector material

ILC:  $\Delta M_H = .032$  GeV,  $\Delta \sigma_{HZ} / \sigma_{HZ} = 2.5\%$  for  $L = 250 \text{ fb}^{-1}$

$\Delta M_H = .015$  GeV,  $\Delta \sigma_{HZ} / \sigma_{HZ} = 1.2\%$  for  $L = 1150 \text{ fb}^{-1}$

$$\sigma_{HZ} \sim g_{HZZ}^2$$

$$\Rightarrow \Delta g_{HZZ} / g_{HZZ} = 1.3\% \text{ (0.6\%)} \text{ for } L = 250 \text{ (1150)} \text{ fb}^{-1}$$

$$e^+ e^- \rightarrow ZH, \nu\nu H \quad \sqrt{s} = 350 \text{ GeV}$$

All of the Higgstrahlung studies that were done at  $\sqrt{s} = 250 \text{ GeV}$  can also be done at  $\sqrt{s} = 350 \text{ GeV}$ . Precisions for  $\sigma \cdot BR$  are comparable, as is the precision for  $\sigma(ZH)$  once  $Z \rightarrow q\bar{q}$  decays are included.

$WW$  fusion production of the Higgs at  $\sqrt{s} = 350 \text{ GeV}$  provides a much better measurement of  $g_{HWW}$  compared to  $\sqrt{s} = 250 \text{ GeV}$ . This gives a much improved estimate of the total Higgs width  $\Gamma_H$  which in turn significantly improves the coupling errors obtained from  $\sigma \cdot BR$  measurements made at  $\sqrt{s} = 250 \text{ GeV}$ .

The recoil Higgs mass measurement is significantly worse at  $\sqrt{s} = 350 \text{ GeV}$  with respect to  $\sqrt{s} = 250 \text{ GeV}$ . However, there is hope that direct calorimeter Higgs mass measurements using  $e^+ e^- \rightarrow \nu\nu H$  will recover the precision.

$$e^+ e^- \rightarrow ZH, \nu\nu H, t\bar{t}H, ZHH \quad \sqrt{s} = 500 \text{ GeV}$$

The  $g_{HWW}$  coupling can also be measured well at  $\sqrt{s} = 500 \text{ GeV}$  through  $WW$  fusion production of the Higgs. Also the measurement of  $\sigma(e^+e^- \rightarrow \nu\nu H) \times BR(H \rightarrow X)$  can be made for many Higgs decay modes  $H \rightarrow X$ .

Through  $e^+e^- \rightarrow ttH$  the top Yukawa coupling can be measured to  $\Delta y_t / y_t = 16.6\%$  with  $500 \text{ fb}^{-1}$  at  $\sqrt{s} = 500 \text{ GeV}$ . With same luminosity at  $\sqrt{s} = 550 \text{ GeV}$  the precision is  $\Delta y_t / y_t = 6.73 \Rightarrow$  **strong motivation to increase nominal energy to  $\sqrt{s} = 550 \text{ GeV}$**

The  $ZHH$  channel is open at  $\sqrt{s} = 500 \text{ GeV}$ . The Higgs self coupling can be measured to 27% with  $4 \text{ ab}^{-1}$  assuming the true value is the SM value.

# $e^+e^- \rightarrow \nu\nu H, ttH, \nu\nu HH$ ILC Energy Upgrade $\sqrt{s} = 1$ TeV

At  $\sqrt{s} = 1$  TeV the ILC provides better measurements of the top Yukawa coupling and Higgs self coupling. For example the Higgs self coupling can be measured to an accuracy of 10% with  $4 \text{ ab}^{-1}$  at  $\sqrt{s} = 1$  TeV (again, assuming the true value is the SM value).

Search for additional Higgs bosons that might have been missed at LHC.

In addition, the ILC becomes a Higgs factory again since the total Higgs cross section is larger than the total cross sections at 250 GeV, specially if polarized beams are used:

## Summary of ILC Higgs Measurement Precisions

## Highlights of Combination of CEPC with ILC G-20 @ 8.1 yrs

	CEPC		ILC+CEPC
$\Delta g_{HZZ}$	0.26%	$\Rightarrow$	0.22%
$\Delta g_{HWW}$	1.22%	$\Rightarrow$	0.38% *
$\Delta g_{Hbb}$	1.30%	$\Rightarrow$	0.68%
$\Delta g_{H\tau\tau}$	1.44%	$\Rightarrow$	0.88%
$\Delta g_{Hgg}$	1.53%	$\Rightarrow$	0.97%

\* Might be interesting to include  $\sigma(WW \rightarrow H)$  in precision Higgs analyses

## Highlights of Combination of CEPC with ILC H-20 @ 20 yrs

	CEPC		ILC+CEPC
$\Delta g_{HZZ}$	0.26%	$\Rightarrow$	0.20%
$\Delta g_{HWW}$	1.22%	$\Rightarrow$	0.26% *
$\Delta g_{Hbb}$	1.30%	$\Rightarrow$	0.47%
$\Delta g_{H\tau\tau}$	1.44%	$\Rightarrow$	0.65%
$\Delta g_{Hgg}$	1.53%	$\Rightarrow$	0.70%

\* Again, might be interesting to include  $\sigma(WW \rightarrow H)$  in precision Higgs analyses

# CEPC Higgs Self Coupling Measurement at $E_{cm}=240$ GeV

M. McCullough, arXiv:1312.3322

$$\delta_{\sigma}^{240} = 100 (2\delta_Z + 0.014\delta_h) \%$$

$g_{hZZ}$  fixed to SM value ( $\delta_z = 0$ )

$g_{hhZZ}$  fixed to SM value

$$\Rightarrow \delta_H = \frac{\delta_{\sigma}^{240}}{0.014} = \frac{0.0051}{0.014} = 36\%$$

*Note:* Oft quoted 30% error comes from combining CEPC with 50% HL-LHC meas.

# CEPC Higgs Self Coupling Measurement at $E_{cm}=240$ GeV

M. McCullough, arXiv:1312.3322

$$\delta_{\sigma}^{240} = 100 (2\delta_Z + 0.014\delta_h) \%$$

$g_{hZZ}$  fixed to SM value ( $\delta_z = 0$ )

$g_{hhZZ}$  fixed to SM value

$$\Rightarrow \delta_H = \frac{\delta_{\sigma}^{240}}{0.014} = \frac{0.0051}{0.014} = 36\%$$

Examples of BSM physics with  $\delta_z \neq 0$ :

Higgs mixes w/ heavy resonances, couplings dictated by symmetries (as in the chiral lagrangian)  
 $\kappa_V \sim \sqrt{1 - \frac{v^2}{f^2}} \approx 1 - \frac{v^2}{2f^2} + \dots$   
 $f$  = decay constant of pNGB Higgs

Coupling deviation contributes to precision electroweak  
 Pre-LHC constraints as good as reach of LHC Higgs coupling measurements

Neutral fermionic partners  
 e.g. *Twin Higgs*

No direct sensitivity @ LHC  
 Higgs is a pNGB, coupling deviations like those of composite Higgs models  
 $\kappa_V \sim \sqrt{1 - \frac{v^2}{f^2}} \approx 1 - \frac{v^2}{2f^2} + \dots$   
 $f$  sets mass scale for neutral top partners; definitive and test of "neutral" naturalness.

Neutral scalar partners

(Not-so) Hidden New Physics

- Thus, due to **extremely high precision measurements**, in this very challenging scenario an  $e^+e^-$  collider offers the possibility of discovering the indirect effects of hidden particles.
- Cross section at CEPC modified by:  

$$\delta\sigma_{Zh} = \frac{|c_h|^2 v^2}{8\pi^2 m_h^2} \left( 1 + \frac{1}{4\sqrt{\tau_0}(\tau_0 - 1)} \log \left[ \frac{1 - 2\tau_0 - 2\sqrt{\tau_0}(\tau_0 - 1)}{1 - 2\tau_0 + 2\sqrt{\tau_0}(\tau_0 - 1)} \right] \right)$$
 where  $\tau_0 = m_h^2/4m_{\tilde{t}_0}^2$  and  $\delta\sigma_{Zh} = (\sigma_{Zh} - \sigma_{Zh}^{SM})/\sigma_{Zh}^{SM}$

Results: Inert Doublet

Note: Oft quoted 30% error comes from combining CEPC with 50% HL-LHC meas.

# ILC Higgs Self Coupling Measurement at $E_{cm}=500$ GeV

$g_{hZZ}$  fixed to value from  $\sigma(ZH)$  measurement

$g_{hhZZ}$  fixed to SM value ← Needs to be more fully addressed in ILC studies

Extract  $g_{hhh}$  from measurement of  $\sigma(ZHH)$

using  $HH \rightarrow b\bar{b}b\bar{b}$  &  $b\bar{b}W^+W^-$

$$\frac{\Delta\sigma(ZHH)}{\sigma(ZHH)} = 16\% \Rightarrow \frac{\Delta g_{hhh}}{g_{hhh}} = 27\% \text{ for ILC scenario H-20 @ 20 years.}$$

Note: This assumes SM  $g_{HHH}$ . If  $g_{HHH} = 2 \times \text{SM}$  then  $\frac{\Delta g_{hhh}}{g_{hhh}} = 27\% \Rightarrow \frac{\Delta g_{hhh}}{g_{hhh}} = 14\%$ .

# Other Higgs Measurements with CEPC & ILC G-20 at 8.1 yrs

	CEPC	ILC	<i>Combined</i>
	250 GeV 5000 fb <sup>-1</sup>	250 + 350 + 500 GeV 500 + 250 + 500 fb <sup>-1</sup>	
$\Delta m_H$	5.9 MeV	25 MeV	5.7 MeV
$\frac{\Delta g_{HHH}}{g_{HHH}}$	36 %	76 %	33 %
$\frac{\Delta g_{ttH}}{g_{ttH}}$	—	16.6 %	16.6 %
$\frac{\Delta g_{ttH}^{(*)}}{g_{ttH}}$	—	6.7 %	6.7 %

\* Assumes ILC 500 GeV running actually takes place at  $\sqrt{s} = 550$  GeV

## Other Higgs Measurements with CEPC & ILC H-20 at 20 yrs

	CEPC 250 GeV 5000 fb <sup>-1</sup>	ILC 250 + 350 + 500 GeV 2000 + 250 + 4000 fb <sup>-1</sup>	<i>Combined</i>
$\Delta m_H$	5.9 MeV	12.5 MeV	5.3 MeV
$\frac{\Delta g_{HHH}}{g_{HHH}}$	36 %	27 %	22 %
$\frac{\Delta g_{ttH}}{g_{ttH}}$	—	5.9 %	5.9 %
$\frac{\Delta g_{ttH}^{(*)}}{g_{ttH}}$	—	2.4 %	2.4 %

(\*) Assumes ILC 500 GeV running actually takes place at  $\sqrt{s} = 550$  GeV

# Summary

## ▶ ILC helps CEPC:

- $A_{LR}$  measurement and top mass
- Precise  $g_{HWW}$  measurement reduces errors on all Higgs couplings
- Top Yukawa coupling
- ILC  $\sigma(ZHH)$  measurement (and others I assume) help interpret precision CEPC  $\sigma(ZH)$  meas.
- New particle searches at 500 GeV

## ▶ CEPC helps ILC:

- Many EW precision measurements:  $M_Z$ ,  $\Gamma_Z$ ,  $\alpha_s$ ,  $N_\nu$ ,  $M_W$ , ...
- Precise  $g_{HZZ}$  measurement reduces errors on all Higgs couplings
- Much better meas. of Higgs invisible width, BSM decays, rare decays such as  $\gamma\gamma$  and  $\mu\mu$
- In general, CEPC gives ILC more flexibility to concentrate on higher  $E_{cm}$  running.

## ▶ CEPC+ILC combination helps the particle physics community:

- Higgs Z coupling error  $\Delta g_{HZ} = 0.2\%$
- Higgs W coupling error  $\Delta g_{WW} = 0.3\%$
- Higgs b coupling error  $\Delta g_{bb} = 0.5\%$
- Higgs self coupling error  $\Delta g_{HHH} = 22\%$
