PDF in 4d QCD

Light-cone parton distribution function

Ji, X.D. PRL78,610(1997), PRD55,7114(1997)

Radyushkin, A.V. PLB.380,417(1996), PLB385,333(1996)

- Experimental extraction. No problem.
- Lattice calculation. Very hard.

Quasi parton distribution function

Ji, X.D. et al. PRLs(2013), PRDs(2014, 2015)

- Lattice calculation. Directly.
- Extract light-cone PD via matching.

Why 2 dimensional QCD in large N limit ?

- ❖ 4d QCD is extremely complicate.
- ❖ 2d QCD in large N limit is simple but nontrivial.
- ❖ It is numerically solvable.

2d model of meson

Approach 1: 't Hooft's Lagrangian approach

't Hooft, Nucl. Phys. B75 (1974) 461-470.

Light cone coordinates :

$$x^\pm = (x^0 \pm x^1)/\sqrt{2}$$

$$x_\pm = (x_0 \pm x_1)/\sqrt{2}$$

$$x_0 = x^0, x_1 = -x^1 \quad \Rightarrow \quad x_\pm = x^\mp$$

$$a \cdot b = a^+ b^- + a^- b^+$$

Light-cone gauge :

$$A^+ = 0 \quad \Rightarrow \quad F^{+-} = \partial^+ A^-, F^{-+} = -\partial^+ A^-.$$

Gamma matrices algebra :

$$\gamma^+ \gamma^- + \gamma^+ \gamma^- = 2$$

$$\gamma^+ \gamma^+ = \gamma^- \gamma^- = 0$$

Lagrangian :

$$\mathcal{L}_{2d} = \frac{1}{2} \text{Tr} \partial^+ A^- \partial^+ A^- + \bar{\psi}^i (i\partial - m_i + g\gamma^+ A^-) \psi^i \quad (1)$$

Feynman rules :

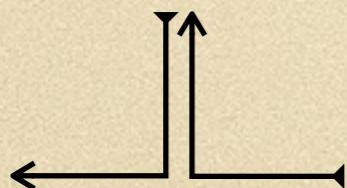

$$\frac{-i}{(k^+)^2}$$

$$\frac{i}{\gamma^- k^+ + \gamma^+ k^- - m_i}$$

$$\frac{ik^+}{2k^- k^+ - m_i^2} \quad (2)$$

$$ig\gamma^+$$

$$i2g$$

Large N limit :

$$N_c \rightarrow \infty, \quad g^2 N_c \rightarrow \text{Const.}$$

Advantages of 2d QCD in Large N limit :

- ❖ No gluon self interaction.
- ❖ No gluon transverse degree of freedom.
- ❖ Only planar diagrams survive.
- ❖ No internal quark loop.
- ❖ Gluon has no propagating mode, no gluon radiation.

Irreducible self energy diagram :

$$-i\Gamma(p) = \frac{p}{\text{---} \rightarrow}$$

Dressed propagator :

$$\frac{ik^+}{2k^+k^- - m_i^2 - k^+\Gamma(k)}$$

$$\frac{k}{\text{---} \rightarrow} = \frac{k}{\text{---} \rightarrow} + \frac{\text{---} \rightarrow}{\text{---} \rightarrow} + \frac{\text{---} \rightarrow}{\text{---} \rightarrow} + \dots$$

Bootstrap equation :

$$\frac{p}{\text{---} \rightarrow} = \frac{p}{\text{---} \rightarrow} + \frac{\text{---} \rightarrow}{\text{---} \rightarrow}$$

$$\Gamma(p) = \frac{-ig^2}{\pi^2} \int dk^+ dk^- \frac{1}{(k^+)^2} \frac{k^+ + p^+}{(k^+ + p^+)(2k^- + 2p^- - \Gamma(k + p)) - m_i^2} \quad (3)$$

$$\int dk^- \frac{1}{(k^+ + p^+)(2k^- - \Gamma(k^+ + p^+) - \frac{m_i^2}{k^+ + p^+} + i\epsilon)} = \frac{i\pi}{2|k^+ + p^+|}$$

↓

$$\Gamma(p^+) = \frac{g^2}{2\pi} \int dk^+ \frac{1}{(k^+)^2} \text{sgn}(k^+ + p^+)$$

↓ **IR divergent, cut-off** $\lambda < |k^+| < \infty$

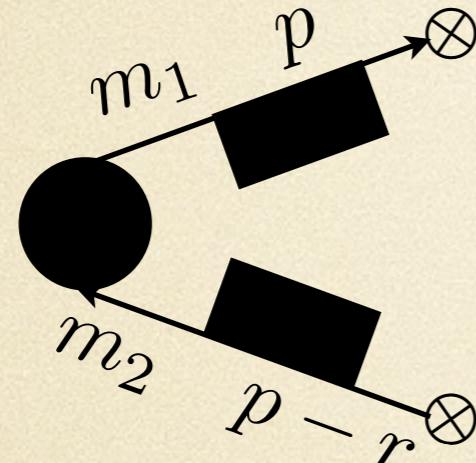

$$\Gamma(p^+) = \frac{g^2}{\pi} \left(\frac{\text{sgn}(p^+)}{\lambda} - \frac{1}{p^+} \right)$$

dressed propagator :

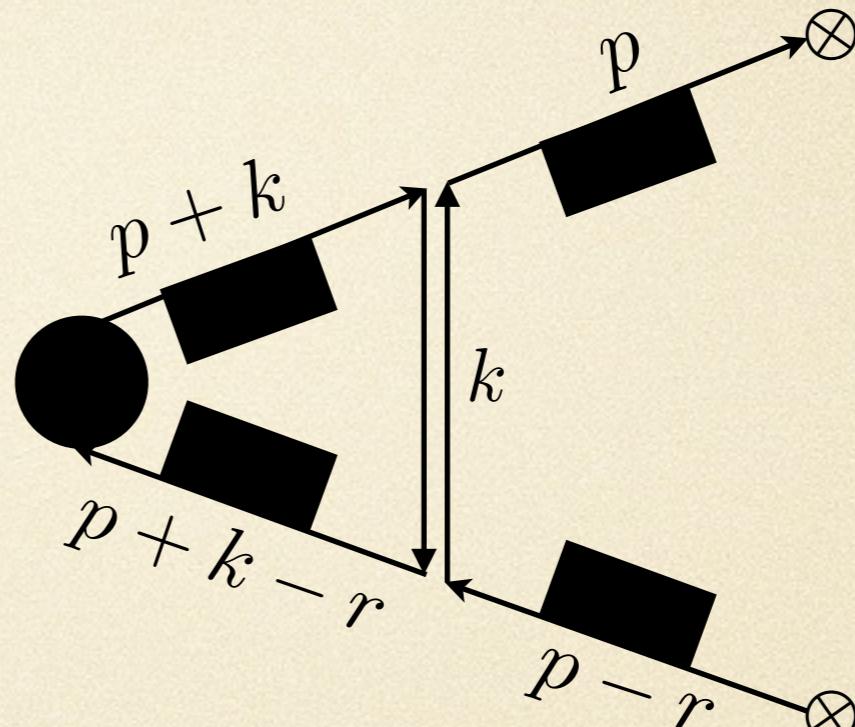

↓

$$\overrightarrow{\quad \quad \quad} = \frac{ik^+}{2k^+ k^- + \frac{g^2}{\pi} - \frac{g^2}{\pi\lambda} |k^+| - m_i^2} \quad (4)$$

Another bootstrap equation :

=

quark: $m_1, \quad p$

anti-quark: $m_2, \quad r - p$

two-particles state: $\psi(p, r)$

$$M_i^2 = m_i^2 - \frac{g^2}{\pi}$$

$$\begin{aligned} \psi(p, r) = & \frac{4g^2}{(2\pi)^2} \int dk^+ dk^- \psi(p+k, r) \frac{i}{(k^+)^2} \frac{p^+}{2p^+ p^- - \frac{g^2}{\pi\lambda} |p^+| - M_1^2} * \\ & * \frac{p^+ - r^+}{2(p^+ - r^+)(p^- - r^-) - \frac{g^2}{\pi\lambda} |p^+ - r^+| - M_2^2} \end{aligned} \quad (5)$$

Defining:

$$\psi(p^+, r) = \int \psi(p, r) dp^-$$

Integrating over p^- on both sides of (5)

$$\psi(p^+, r) =$$

$$\int dp^- \frac{1}{(p^- - r^-) - \frac{M_2^2}{2(p^+ - r^+)} - (\frac{g^2}{2\pi\lambda} - i\epsilon)\text{sgn}(p^+ - r^+)} \frac{1}{p^- - \frac{M_1^2}{2p^+} - (\frac{g^2}{2\pi\lambda} - i\epsilon)\text{sgn}(p^+)} * \quad (6)$$

$$* \frac{ig^2}{(2\pi)^2} \int dk^+ \psi(p^+ + k^+, r) \frac{1}{(k^+)^2}$$

The first integral is non-zero only if:

$$\boxed{\text{sgn}(p^+ - r^+) = -\text{sgn}(p^+)}$$

$$\psi(p^+, r) = \frac{g^2}{2\pi} \frac{\theta(p^+)\theta(r^+ - p^+)}{-r^- + \frac{M_1^2}{2p^+} + \frac{M_2^2}{2(r^+ - p^+)} + \frac{g^2}{\pi\lambda}} \int dk^+ \frac{\psi(p^+ + k^+, r)}{(k^+)^2} \quad (7)$$

Hadamard regularization :

Hadamard, Lectures on Cauchy's problem in linear partial differential equations, Dover Phoenix editions, 1923.

$$\mathcal{H} \int_a^b \frac{f(x)}{(x-t)^2} dx = \lim_{\lambda \rightarrow 0^+} \left(\int_a^{t-\lambda} \frac{f(x)}{(x-t)^2} dx + \int_{t+\lambda}^b \frac{f(x)}{(x-t)^2} dx - \frac{2f(t)}{\lambda} \right) \quad (8)$$

with cut-off

$$\boxed{\int_a^b dk^+ \frac{\psi(p^+ + k^+, r)}{(k^+)^2}} = \mathcal{H} \int_a^b dk^+ \frac{\psi(k^+ + p^+, r)}{(k^+)^2} + \frac{2\psi(p^+, r)}{\lambda} \quad (9)$$

substituting (9) into (7)

$$\left(\frac{M_1^2}{2p^+} + \frac{M_2^2}{2(r^+ - p^+)} \right) \psi(p^+, r) - \frac{g^2}{2\pi} \mathcal{H} \int_{p^+}^{r^+ - p^+} dk^+ \frac{\psi(k^+ + p^+, r)}{(k^+)^2} = r^- \psi(p^+, r) \quad (10)$$

Defining new parameters :

$$\begin{aligned}\alpha_{1,2} &= \frac{\pi M_{1,2}^2}{g^2} \\ \frac{p^+}{r^+} &= x \\ 2r^+ r^- &= \frac{g^2}{\pi} \mu^2\end{aligned}\tag{11}$$

Equation (10) becomes 't Hooft equation:

$$\mu^2 \phi(x) = \left(\frac{\alpha_1}{x} + \frac{\alpha_2}{1-x} \right) \phi(x) - \mathcal{H} \int_0^1 \frac{\phi(y)}{(y-x)^2} dy\tag{12}$$

Approach 2: Hamiltonian method in axial gauge

Bars and Green, PRD.17.(1978)537-545

Kalashnikova, Nefediev, and Volodin, Phys. Atom. Nucl.63.(2000)1623-1628

Shifman, Advanced Topics in Quantum Field Theory, 2012

Axial gauge :

$$A_1(t, x) = 0$$

Gamma matrices convention :

$$\gamma^0 = \sigma_3, \gamma^1 = i\sigma_2, \gamma_5 = \gamma^0\gamma^1 = \sigma_1$$

Lagrangian :

$$\mathcal{L}_{2d} = \frac{1}{2}\text{Tr}(\partial_1 A_0)^2 + \bar{\psi}^i(i\partial + g\gamma^0 A_0 - m_i)\psi^i \quad (13)$$

Equation of motion :

$$(\partial_1)^2 A_0^a = g\psi^\dagger T^a \psi^i \quad (14)$$

Solution :

$$A_0^a(x) = \int dy |x - y| g\psi^\dagger(y) T^a \psi^i(y) \quad (15)$$

Hamiltonian

$$\begin{aligned} H = & \int dx \psi^\dagger (-i\gamma_5 \partial_1 + \gamma^0 m_i) \psi \\ & + \frac{g^2}{4} \int dxdy |x - y| \psi^\dagger(x) T^a \psi(x) \psi^\dagger(y) T^a \psi(y) \end{aligned} \quad (16)$$

Dressing fermion field

$$\psi(t, x) = \int \frac{dk}{2\pi} e^{ikx} (b(k, t) u(k) + d^\dagger(-k, t) v(-k)) \quad (17)$$

$$\begin{aligned}
b(k, t)|0\rangle &= d(-k, t)|0\rangle = 0, \\
b(k, t)|0\rangle &= |k\rangle, \\
d(-k, t)|0\rangle &= |-k\rangle.
\end{aligned}$$

Commutation relations :

$$\begin{aligned}
\{b(p, t), b^\dagger(q, t)\} &= \{d(-p, t), d^\dagger(-q, t)\} = 2\pi\delta(p - q) \\
\{b(p, t), b(q, t)\} &= \{d(-p, t), d(-q, t)\} = \dots = 0
\end{aligned}$$

Spinors :

$$\begin{aligned}
T(k) &= -\frac{1}{2}\theta(k)\gamma^1 = \begin{pmatrix} \cos(\theta/2) & -\sin(\theta/2) \\ \sin(\theta/2) & \cos(\theta/2) \end{pmatrix}, \\
u(k) &= \begin{pmatrix} \cos(\theta/2) \\ \sin(\theta/2) \end{pmatrix} = T(k) \begin{pmatrix} 1 \\ 0 \end{pmatrix}, \\
v(k) &= \begin{pmatrix} -\sin(\theta/2) \\ \cos(\theta/2) \end{pmatrix} = T(k) \begin{pmatrix} 0 \\ 1 \end{pmatrix}.
\end{aligned} \tag{18}$$

Normal ordered Hamiltonian

$$H = H_0 + :H_2: + :H_4: \quad (19)$$

$$H_0 = \int dx \int \frac{dp}{2\pi} \text{Tr} \left((\gamma_5 p + \gamma^0 m) \Lambda_-(p) + \frac{1}{4} \int dk \frac{\Lambda_+(k) \Lambda_-(k)}{(p - k)^2} \right)$$

$$:H_2:= \int dx : \psi^\dagger(x) (-i\gamma_5 \partial_x + \gamma^0 m) \psi(x) :$$

$$- \int dx dy dk \frac{|x - y|}{4} : \psi^\dagger(x) \left(\Lambda_+(k) - \Lambda_-(k) \right) \psi(y) : e^{ik(x-y)}$$

$$:H_4: = -\frac{g^2}{4} \int dx dy : \psi^\dagger(x) T^a \psi(x) \psi^\dagger(y) T^a \psi(y) : |x - y|$$

$$\Lambda_\pm(p) = T(p) \frac{1 \pm \gamma^0}{2} T^\dagger(p)$$

Diagonalize Hamiltonian

$$:H_2:=\int \frac{dk}{2\pi} E(k) \left(b^\dagger(k)b(k) + d^\dagger(-k)d(-k) \right) \quad (20)$$

$$\begin{aligned} & \int dx : \psi^\dagger(x)(-i\gamma_5\partial_x + \gamma^0 m)\psi(x) : \\ &= \int dp \left((p \sin \theta_p + m \cos \theta_p) b^\dagger(p)b(p) + (p \cos \theta_p - m \sin \theta_p) b^\dagger(p)d^\dagger(-p) \right. \\ & \quad \left. + (p \cos \theta_p - m \sin \theta_p) d(-p)b(p) + (p \sin \theta_p + m \cos \theta_p) d^\dagger(-p)d(-p) \right) \end{aligned}$$

$$\begin{aligned} & \int dxdydk \frac{|x-y|}{4} : \psi^\dagger(x) \left(\Lambda_+(k) - \Lambda_-(k) \right) \psi(y) : e^{ik(x-y)} \\ &= \int dp \int \frac{dk}{(p-k)^2} \left(\sin^2 \left(\frac{\theta_p - \theta_k}{2} \right) b^\dagger(p)b(p) + \frac{\sin(\theta_p - \theta_k)}{2} b^\dagger(p)d^\dagger(-p) \right. \\ & \quad \left. + \frac{\sin(\theta_p - \theta_k)}{2} d(-p)b(p) - \cos^2 \left(\frac{\theta_p - \theta_k}{2} \right) d^\dagger(-p)d(-p) \right) \end{aligned}$$

Integral is divergent at the IR region, all infinite terms must be regularized, only finite terms are left.

$$f \equiv \mathcal{H} \int$$

Gap equation for Bogolyubov-Valatin angle

$$p \cos \theta(p) - m \sin \theta(p) = \frac{1}{4} \int dk \frac{\sin[\theta(p) - \theta(k)]}{(p - k)^2} \quad (21)$$

Dispersion relation

$$E(p) = p \sin \theta(p) + m \cos \theta(p) + \frac{1}{4} \int dk \frac{\cos[\theta(p) - \theta(k)]}{(p - k)^2} \quad (22)$$

Color singlet bilinear operators :

$$\begin{aligned}
 B(p, p') &= \frac{1}{\sqrt{N_C}} b_i^\dagger(p) b_i(p'), \\
 D(p, p') &= \frac{1}{\sqrt{N_C}} d_i^\dagger(-p) d_i(-p'), \\
 M(p, p') &= \frac{1}{\sqrt{N_C}} d_i(-p) b_i(p'), \\
 M^\dagger(p, p') &= \frac{1}{\sqrt{N_C}} b_i^\dagger(-p) d_i^\dagger(p')
 \end{aligned} \tag{23}$$

Commutation relations in Large N limit :

$$\begin{aligned}
 [M(p, p'), M^\dagger(q, q')] &= (2\pi)^2 \delta(p - q) \delta(p' - q'), \\
 [B(p, p'), X(q, q')] &= 0, \\
 [D(p, p'), X(q, q')] &= 0 \\
 X(q, q') &\in \{B, D, M, M^\dagger\}
 \end{aligned} \tag{24}$$

Ansatz :

Lenz, Thies, Levit and Yazaki, Ann.Phys.(N.Y.)208.(1991)1-89

$$\begin{aligned} B(p, p') &= \frac{1}{\sqrt{N_C}} \int \frac{dq}{2\pi} M^\dagger(q, p) M(q, p'), \\ D(p, p') &= \frac{1}{\sqrt{N_C}} \int \frac{dq}{2\pi} M^\dagger(p, q) M(p', q). \end{aligned} \quad (25)$$

$:H_2:+:H_4:$

$$\begin{aligned} &= \int \frac{dQ dq}{(2\pi)^2} \left(E(p) + E(Q - p) \right) M^\dagger(p - Q, p) M(p - Q, p) \\ &- \int \frac{dQ dq}{(2\pi)^2} \frac{1}{4} \int \frac{dk}{(p - k)^2} \left(2C(p, k, Q) M^\dagger(p - Q, p) M(k - Q, k) + \right. \\ &\quad \left. + S(p, k, Q) [M(p, p - Q) M(k - Q, k) + M^\dagger(p, p - Q) M^\dagger(k - Q, k)] \right) \end{aligned}$$

$$C(p, k, Q) = \cos \frac{\theta(p) - \theta(k)}{2} \cos \frac{\theta(Q - p) - \theta(Q - k)}{2}$$

$$S(p, k, Q) = \sin \frac{\theta(p) - \theta(k)}{2} \sin \frac{\theta(Q - p) - \theta(Q - k)}{2}$$

Define operators :

$$\begin{aligned} m_n^\dagger(Q) &= \int \frac{dq}{2\pi} \left(M^\dagger(q - Q, q) \phi_n^+(q, Q) + M(q, q - Q) \phi_n^-(q, Q) \right) \\ m_n(Q) &= \int \frac{dq}{2\pi} \left(M(q - Q, q) \phi_n^+(q, Q) + M^\dagger(q, q - Q) \phi_n^-(q, Q) \right) \end{aligned} \quad (26)$$

Normalization conditions :

$$\begin{aligned} \int \frac{dq}{2\pi} \left(\phi_m^+(q, Q) \phi_n^+(q, Q) - \phi_m^-(q, Q) \phi_n^-(q, Q) \right) &= \delta_{mn} \\ \int \frac{dq}{2\pi} \left(\phi_n^+(q, Q) \phi_m^-(q, Q) - \phi_n^-(q, Q) \phi_m^+(q, Q) \right) &= 0 \end{aligned} \quad (27)$$

Completeness conditions :

$$\begin{aligned} \sum_{n=0}^{\infty} \left(\phi_n^+(q, Q) \phi_n^+(k, Q) - \phi_n^-(q, Q) \phi_n^-(k, Q) \right) &= 2\pi \delta(q - k) \\ \sum_{n=0}^{\infty} \left(\phi_n^+(q, Q) \phi_n^-(k, Q) - \phi_n^-(q, Q) \phi_n^+(k, Q) \right) &= 0 \end{aligned} \quad (28)$$

Commutation relations :

$$[m_n(Q), m_m^\dagger(Q')] = 2\pi\delta(Q - Q')\delta_{nm}$$

$$[m_n(Q), m_m(Q')] = [m_n^\dagger(Q), m_m^\dagger(Q')] = 0$$

Diagonalize Hamiltonian :

$$:H_2:+:H_4:=\frac{1}{2}\sum_{n=0}^{\infty}\int \frac{dQ}{2\pi}Q_n^0(Q)m_n^\dagger(Q)m_n(Q)$$

Bars-Green equations :

$$\left(E(p) + E(Q-p) - Q^0\right)\phi^+(p, Q) = \frac{1}{2} \int \frac{dk}{(p-k)^2} \left(C(p, k, Q)\phi^+(k, Q) - S(p, k, Q)\phi^-(k, Q)\right)$$

$$\left(E(p) + E(Q-p) + Q^0\right)\phi^-(p, Q) = \frac{1}{2} \int \frac{dk}{(p-k)^2} \left(C(p, k, Q)\phi^-(k, Q) - S(p, k, Q)\phi^+(k, Q)\right)$$

(29)

Relation :

$$\phi(p, Q) = T(p) \left(\frac{1 + \gamma^0}{2} \gamma_5 \phi^+(p, Q) + \frac{1 - \gamma^0}{2} \gamma_5 \phi^-(p, Q) \right) T^\dagger(Q - p) \quad (30)$$

Explanation :

Moving forward : $\phi^+(p, Q)$

Moving backward : $\phi^-(p, Q)$

Bars-Green claim :

Bars-Green equations are equivalent to 't Hooft equation

$$Q \rightarrow \infty \quad \Rightarrow \quad \phi^- \rightarrow 0 \text{ and } \phi^+ \rightarrow \phi$$

Static case :

Li, Wilets and Birse, J.Phys.G.13(1987)915-923

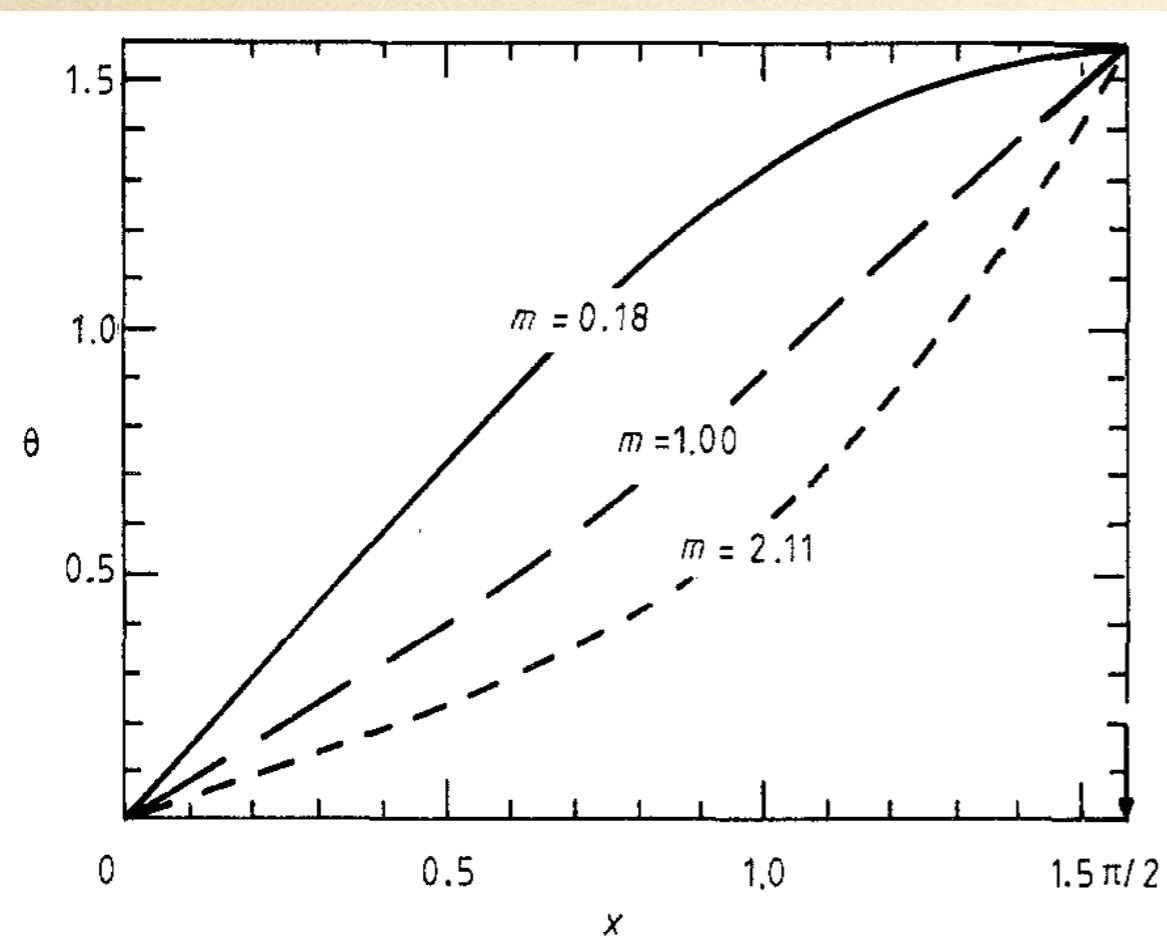

Bars-Green equations :

$$(2E(p) - Q^0)\phi^+(p) = \frac{1}{2} \int \frac{dk}{(p-k)^2} (C(p, k)\phi^+(k) - S(p, k)\phi^-(k))$$

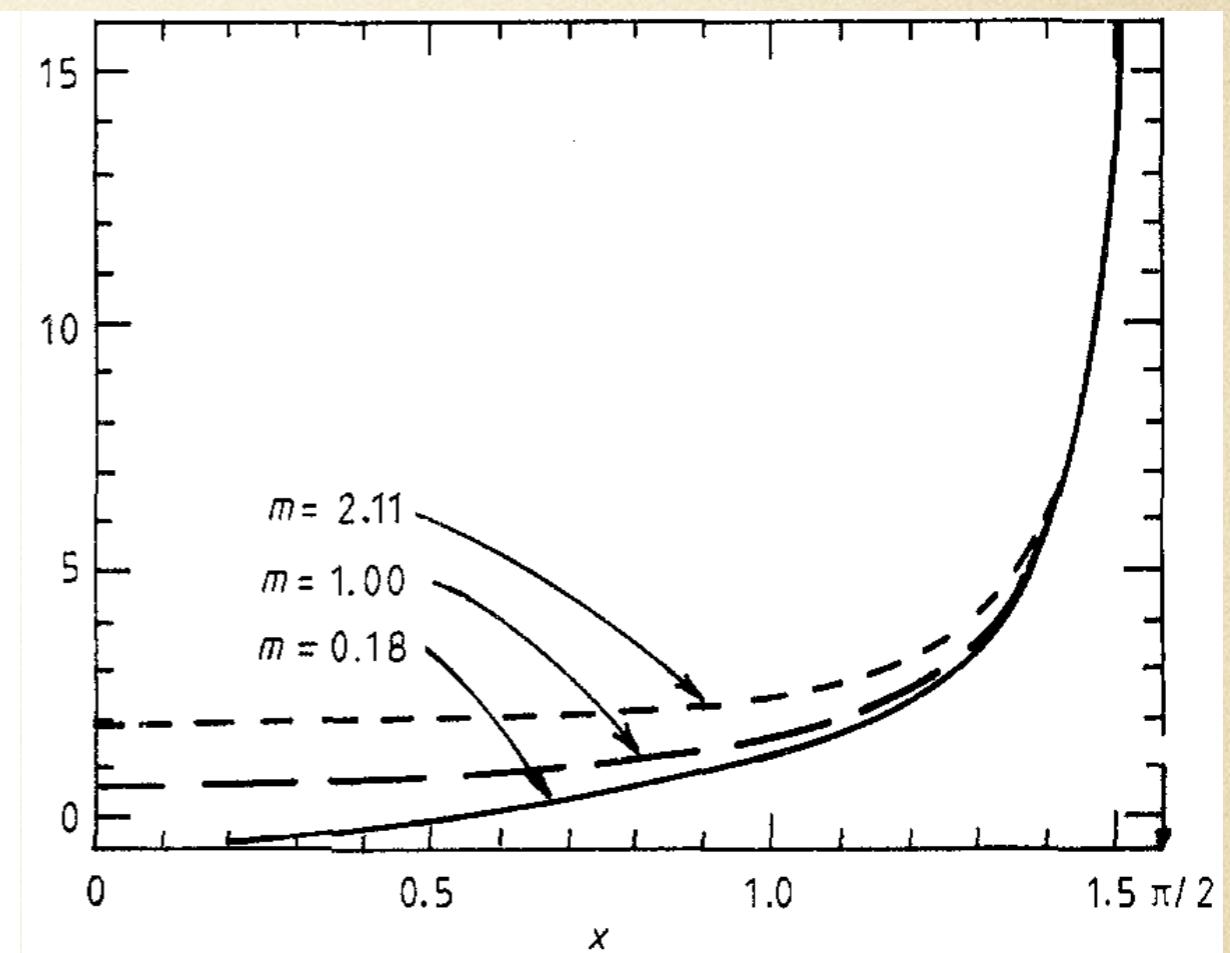

$$(2E(p) + Q^0)\phi^-(p) = \frac{1}{2} \int \frac{dk}{(p-k)^2} (C(p, k)\phi^-(k) - S(p, k)\phi^+(k))$$

Numerical solution strategies :

1. Solving gap equation to get $\theta(p)$
2. Using dispersion equation to get $E(p)$
3. Finding a basis of functions.
4. Obtaining meson spectrum and related wave functions.

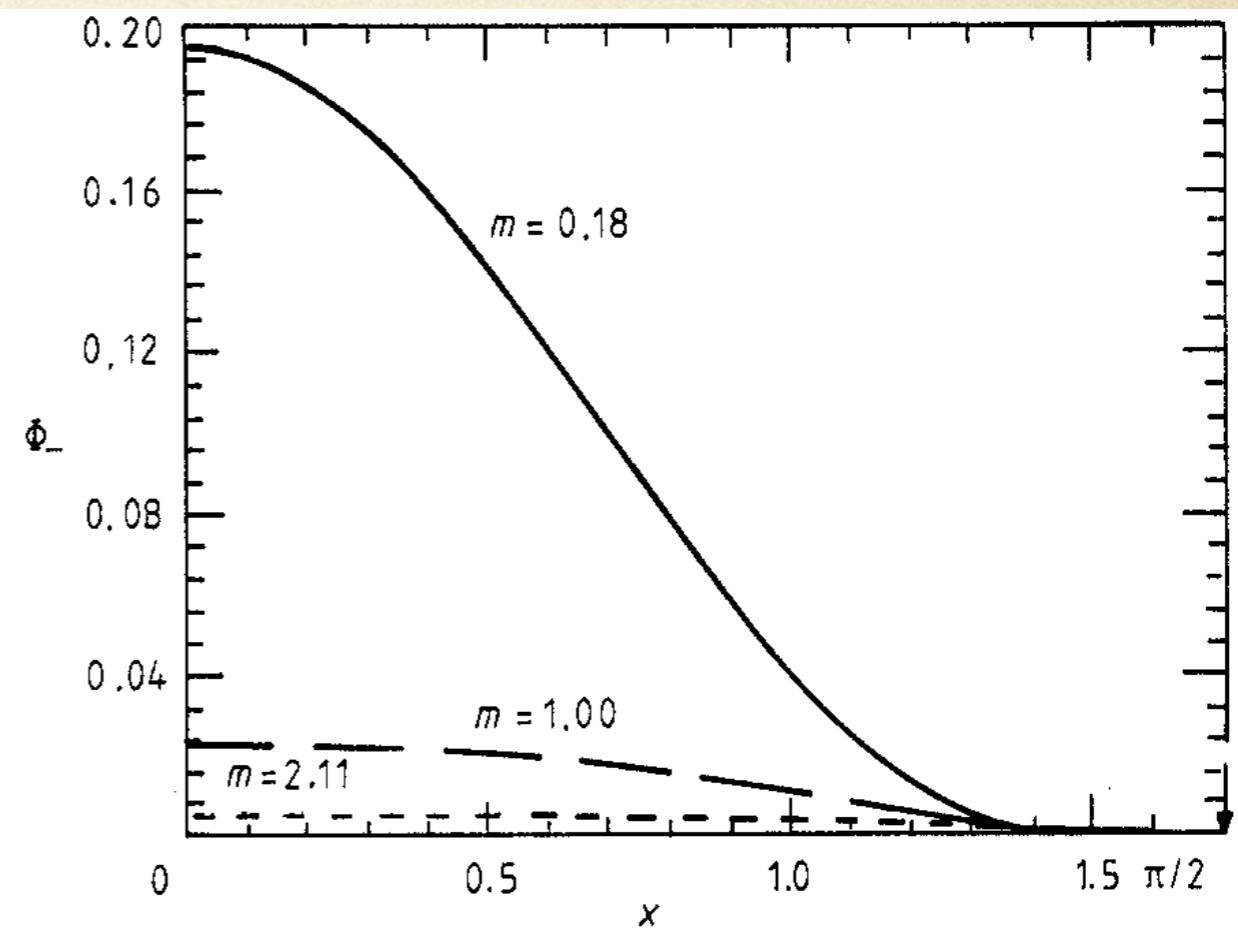

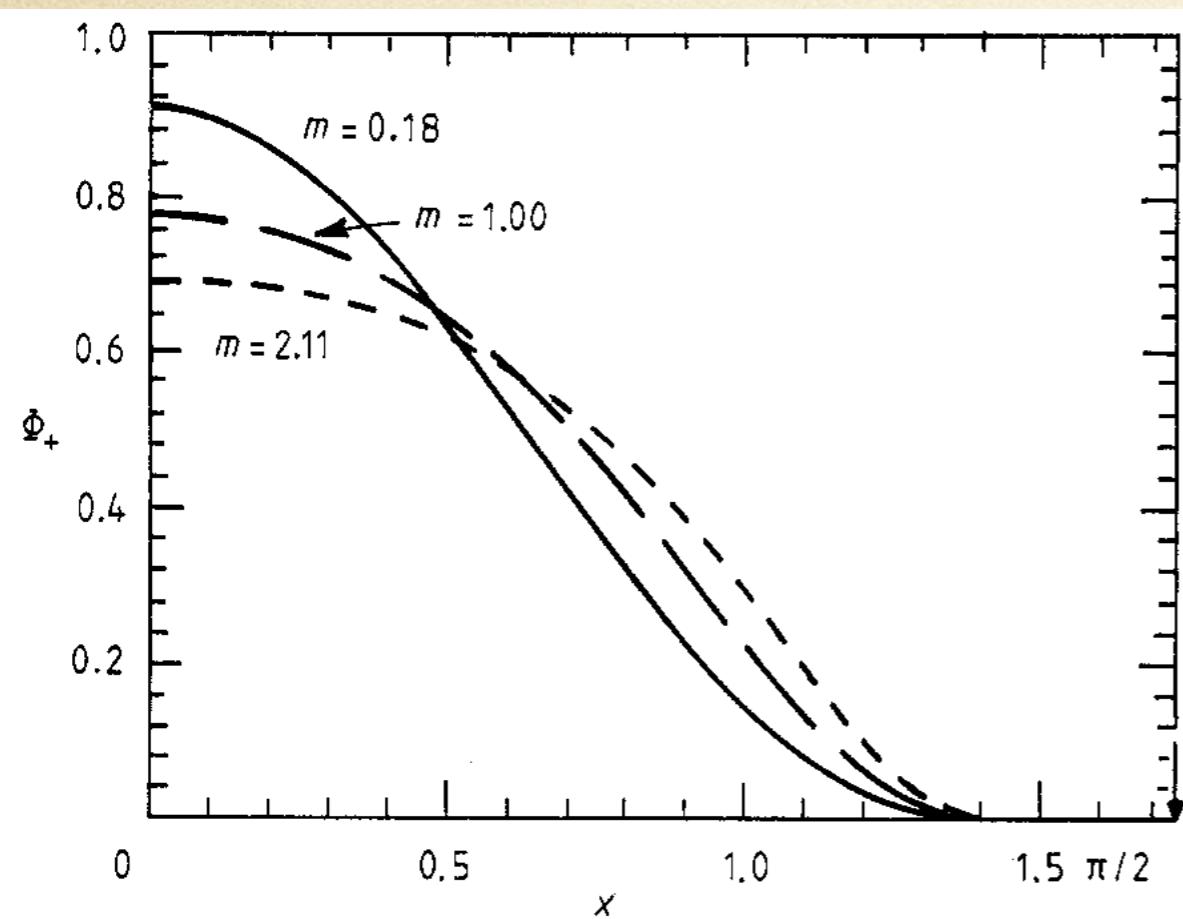

$$\theta(p)$$

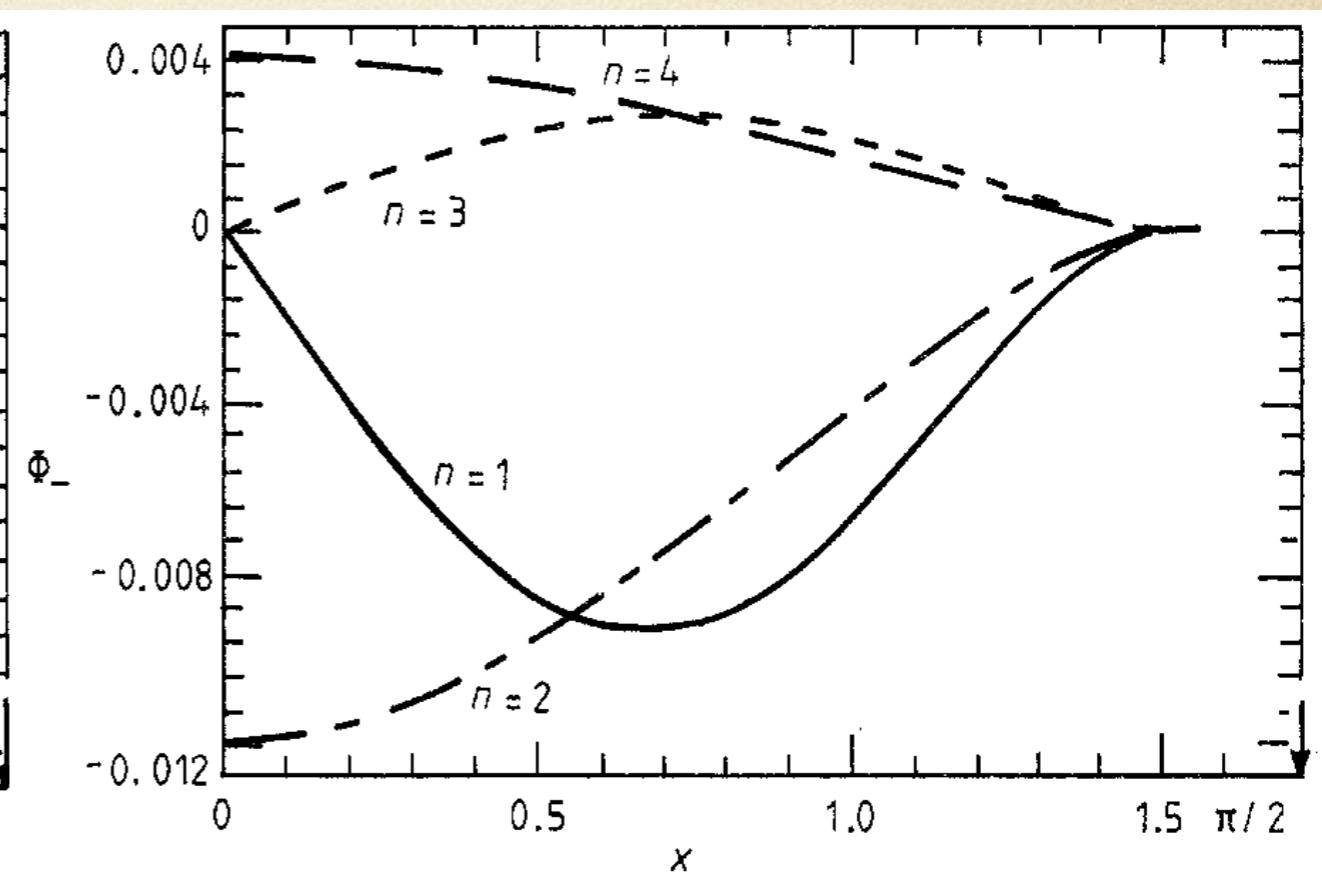

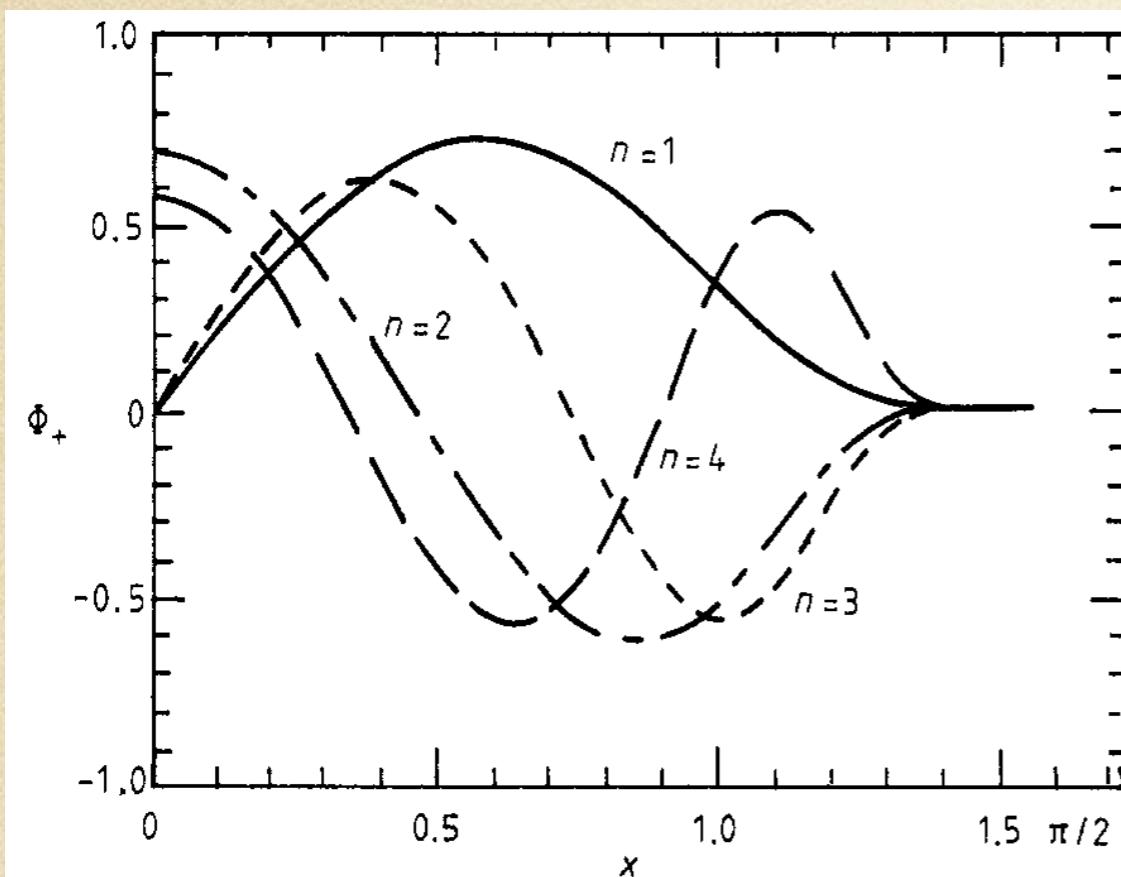

$$p = \tan(x)$$

n	$m = 0.18$	$m = 0.56$	$m = 1.0$	$m = 1.61$	$m = 2.11$
0	0.88	1.78	2.70	3.92	4.91
1	2.73	3.39	4.16	5.26	6.17
2	4.00	4.54	5.21	6.21	7.06
3	5.00	5.47	6.09	7.02	7.84
4	5.86	6.28	6.85	7.73	8.51
5	6.61	7.00	7.54	8.38	9.13
6	7.30	7.66	8.17	8.98	9.71

Meson spectra with different quark masses m

functions of ground state of meson with different quark masses

functions of excited states of meson with quark mass $m=0.18$

Numerical results :

quark mass :

$$m \rightarrow \infty \Rightarrow \phi^- \rightarrow 0$$

higher excited state :

$$n \rightarrow \infty \Rightarrow \phi^- \rightarrow 0$$

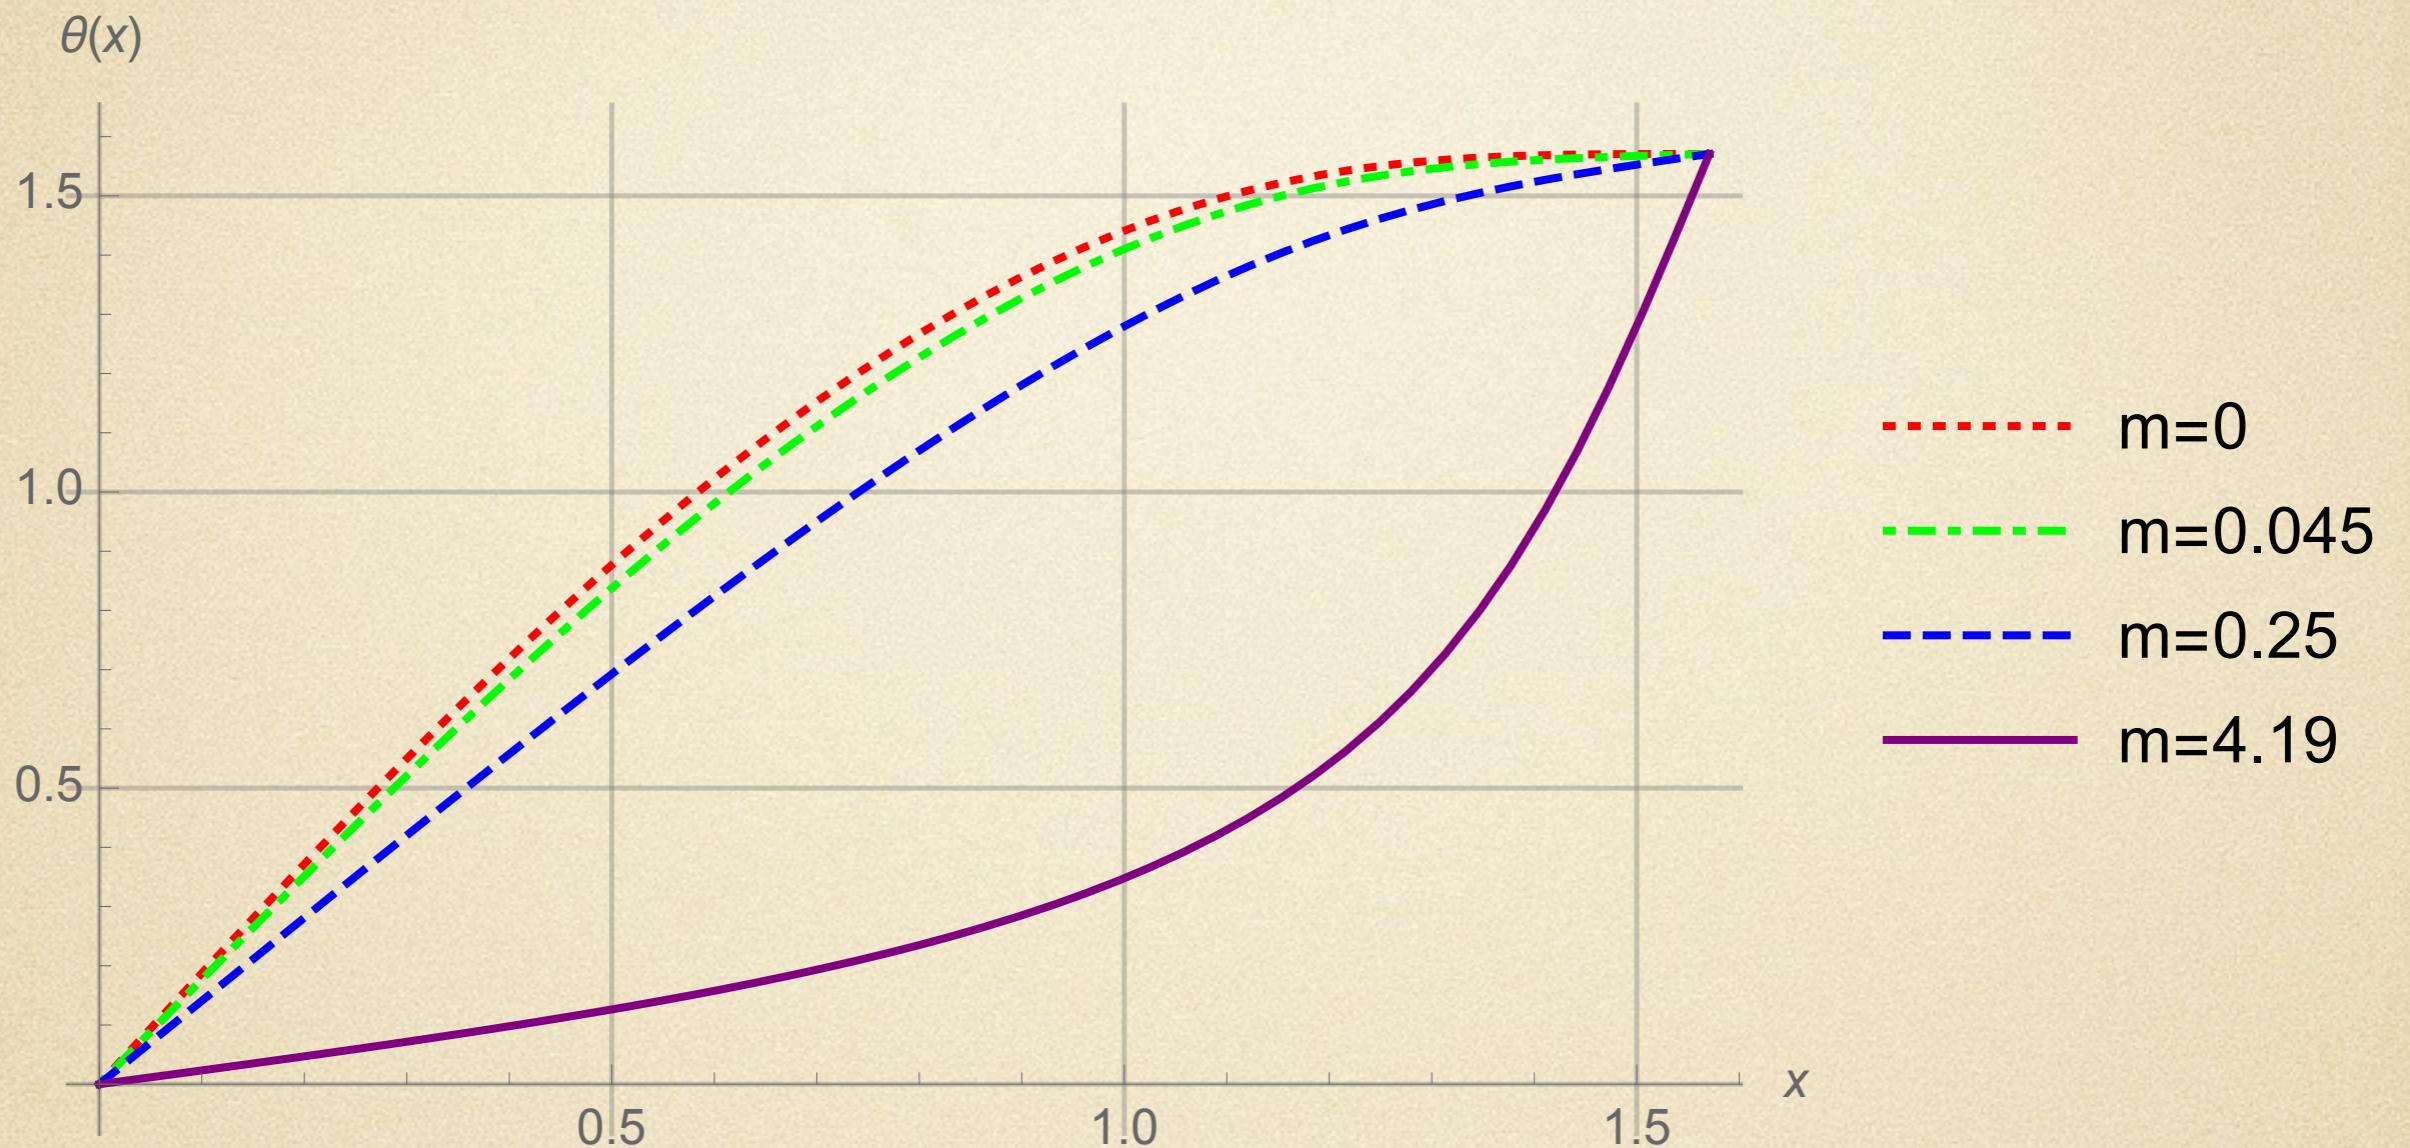

Ours results :

Jia, Liang, Li, and Xiong, in preparation

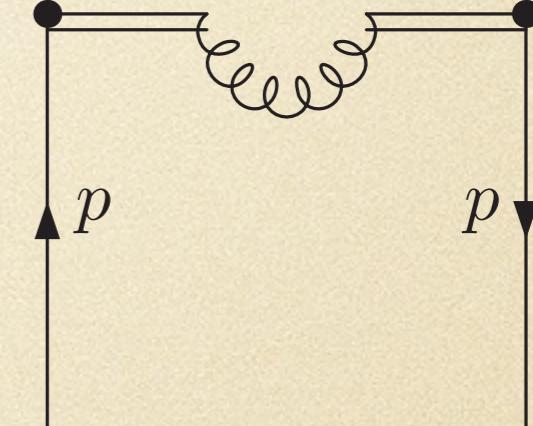

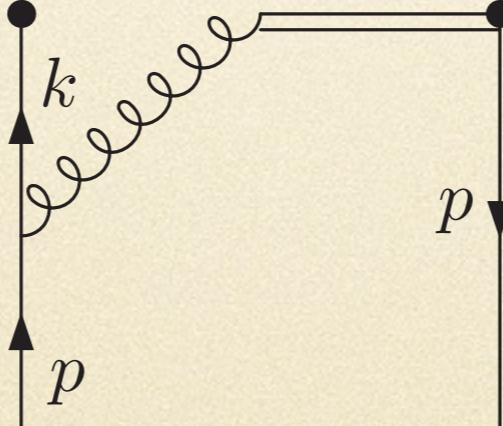

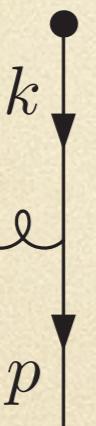

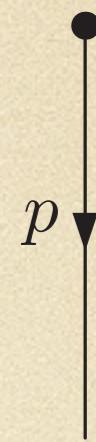

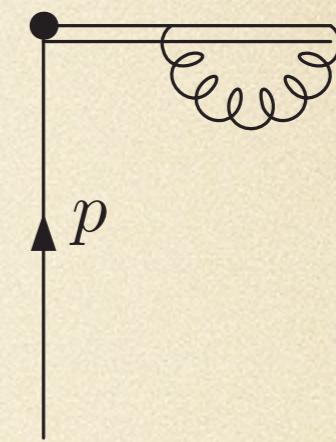

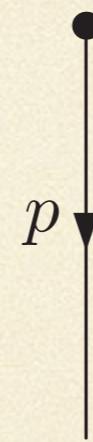

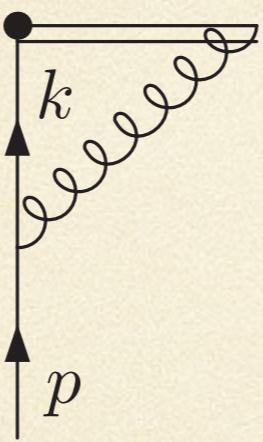

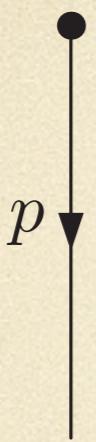

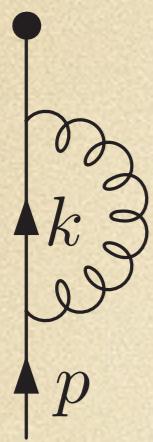

1. Solving gap equation to get $\theta(p)$ ✓
2. Using dispersion equation to get $E(p)$ ✓
3. Finding a basis of functions for moving mesons. ✓
4. Obtaining meson spectra and related wave functions. ✓

Results beyond LWB :

1. Finding a basis of functions for moving mesons.
2. Meson spectra and related wave functions of zero quark mass.
3. Verified Bars-Green's claim.

Bogolyubov-Valatin angle for different quarks

Taking Feynman gauge

light-cone PD in 2d QCD

$$q_a(x) = \left(\frac{\mu^2 e^{\gamma_E}}{4\pi} \right)^\epsilon f \frac{2^{2\epsilon+1} \pi^{\epsilon+1} m^{-2(\epsilon+1)} (1-x)^{-2\epsilon-3} (x((x\epsilon+2)+\epsilon) \csc(\pi\epsilon))}{\Gamma(-\epsilon)}$$

$$z_a(x) = \left(\frac{\mu^2 e^{\gamma_E}}{4\pi} \right)^\epsilon \frac{f}{2m^2} \delta(x-1)$$

$$q_b(x) = - \left(\frac{\mu^2 e^{\gamma_E}}{4\pi} \right)^\epsilon f \frac{x 2^{2\epsilon+1} \pi^{\epsilon+1} m^{-2(\epsilon+1)} (1-x)^{-2\epsilon-3} \csc(\pi\epsilon)}{\Gamma(-\epsilon)}$$

$$z_b(x) = - \left(\frac{\mu^2 e^{\gamma_E}}{4\pi} \right)^\epsilon \frac{f}{m^2} \delta(x-1)$$

$$q_d(x) = 0$$

$$z_d(x) = 0$$

Quasi PDF in 2d QCD

Too complicated to be showed here.

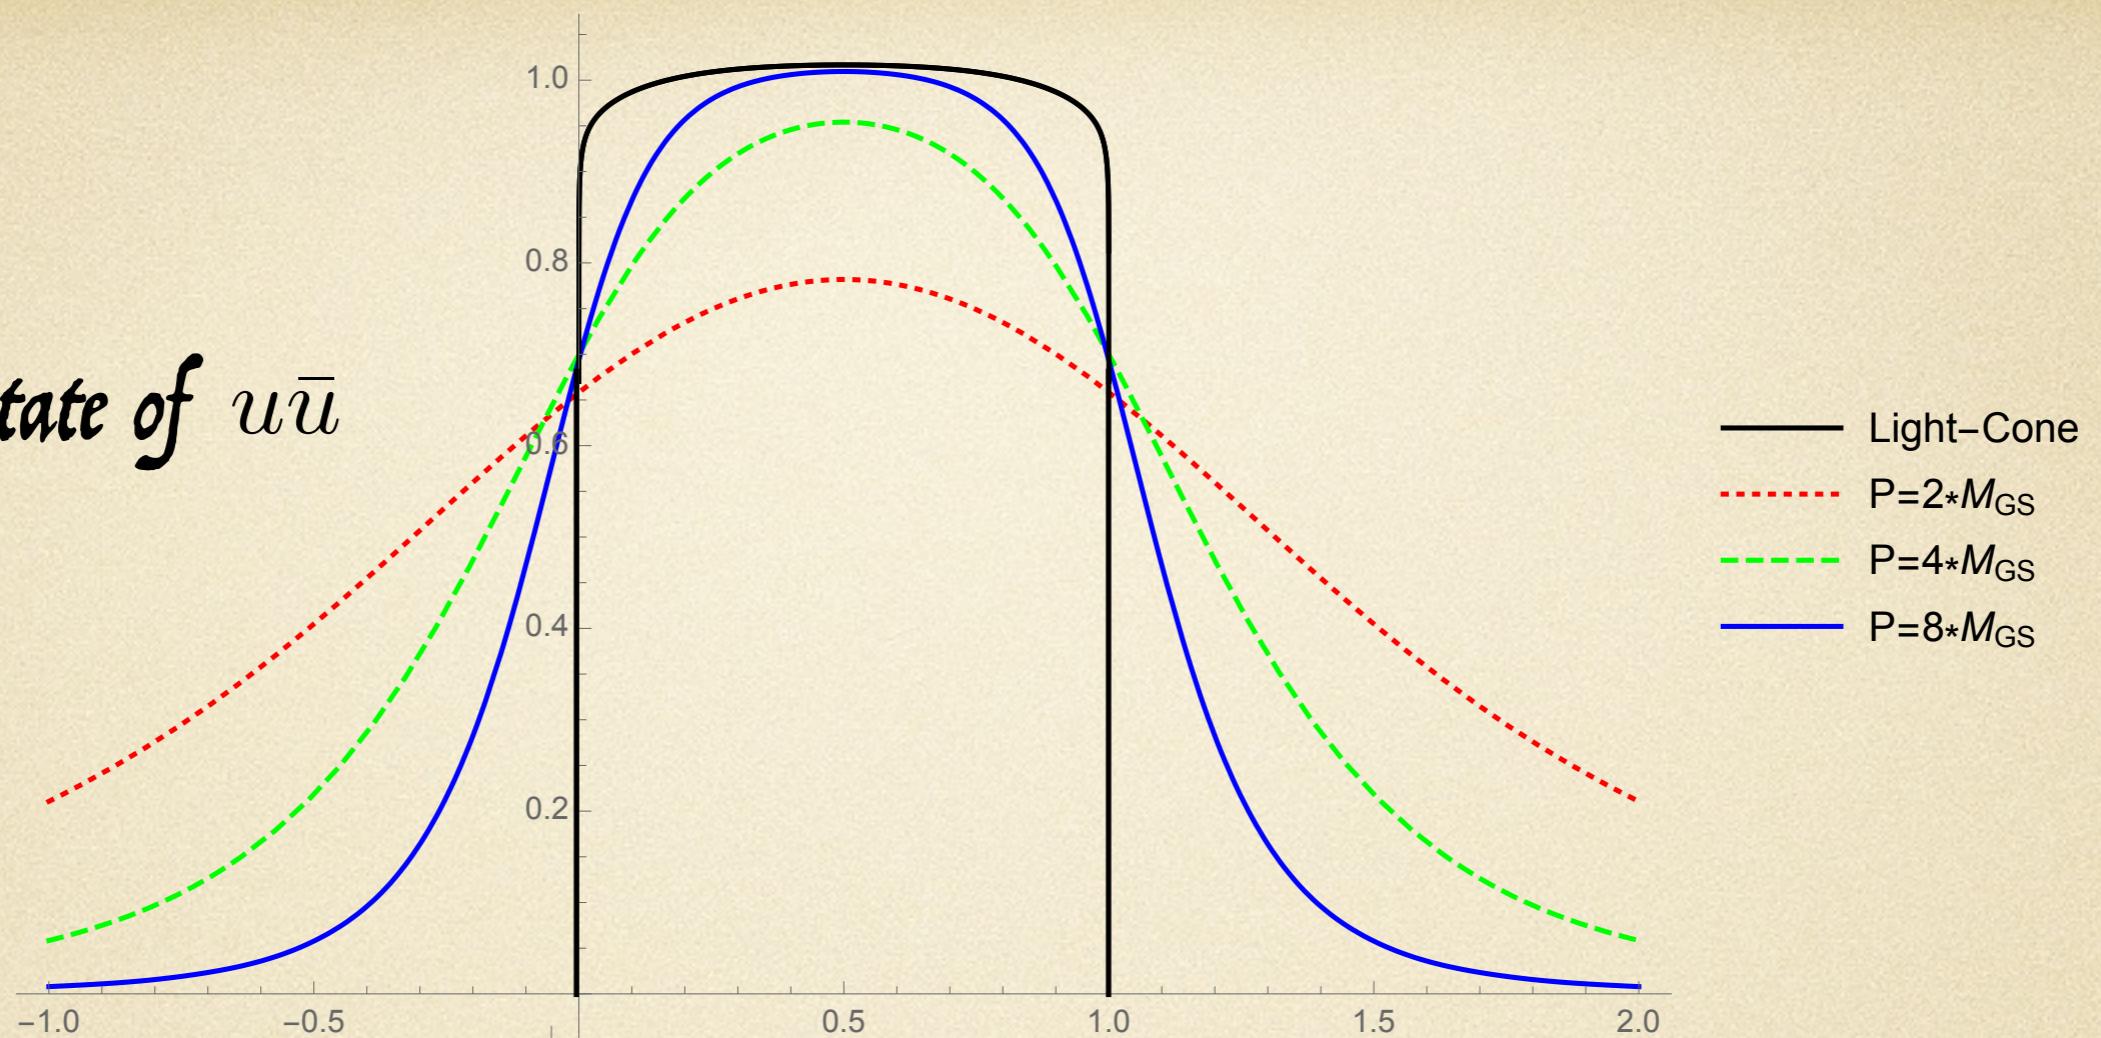

Sharing the same IR structure as light-cone PDF except some terms $\frac{m}{p^z}$

Matching condition

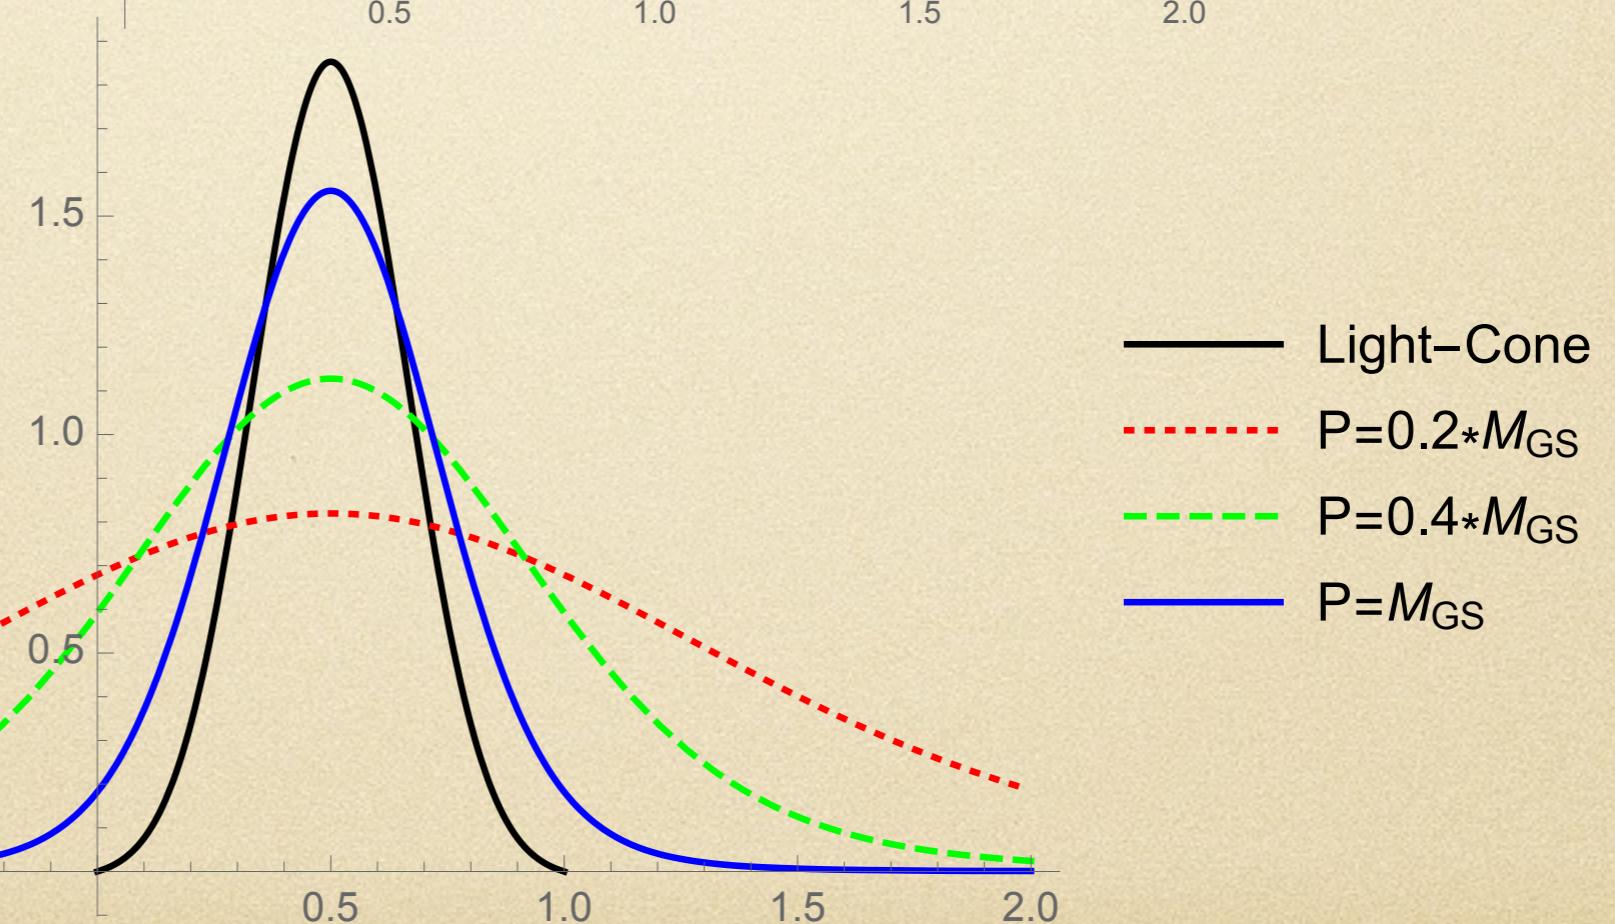

$$\tilde{q} \left(x, \frac{\mu}{p^z} \right) = \int \frac{dy}{|y|} Z \left(\frac{x}{y}, \frac{\mu}{p^z} \right) q(y)$$

$$Z \left(\frac{x}{y} \right) |_{p^z \gg m} = \delta \left(\frac{x}{y} - 1 \right)$$

Ground state of $u\bar{u}$

Ground state of $c\bar{c}$

Conclusions and outlooks :

- ❖ *Equivalence of different approaches.*
- ❖ *Bars-Green's claim is right.*
- ❖ *Goldstone boson exists in 2d QCD at large N limit.*
- ❖ *Generalized Bars-Green equation for two different flavor quarks.*
- ❖ *Nonperturbative QCD variables in HQET will be calculated.*
- ❖ ...

Thanks for your attention
